177 COK-H0678-1297 -RP307

INDEX

AARONSON, Dr. H. I. : Mechanism of Phase Transformations in Metals, 420
Abbott, Dr. B. C., and Lowy, Dr. J. : A New Muscle Preparation for the Study of Optical Changes during Contraction, 788
Abelson, Philip H., and others : Studies of Biosynthesis in *Escherichia coli*, *review* by Dr. Kenneth McQuillen, 594
Aberrations during Stimulation by Flickering Light : Colour Illusions and (Dr. W. Grey Walter), 710
Ability : Scientific—its Detection and Development (British Social Biology Council Conference on), 464, 823
Ablett Prizes for 1955 of the Iron and Steel Institute awarded to W. Ernest, S. R. Phelps and R. Stewartson, 919
Abnormal Colour Responses of the Minnow resulting from Inhibition of Movement (Dr. E. G. Gray), 91
Abnormal Hæmoglobins in some Australian Aboriginals : Absence of (Dr. W. R. Horsfall and Dr. H. Lehmann), 41
Abnormal Hæmoglobins in the Kasai Province of the Belgian Congo (Dr. J. Vandepitte and Dr. Arno G. Motulsky), 757
Aboriginals (Australian) : Absence of Abnormal Hæmoglobins in some (Dr. W. R. Horsfall and Dr. H. Lehmann), 41
Abraham, Dr. E. P., and Newton, Dr. G. G. F. : Antibiotics and Mould Metabolites, 1059
Abrahams, Dr. V. C. : Awarded a Junior Beit Memorial Fellowship for Medical Research, 966
Absence of Abnormal Hæmoglobins in some Australian Aboriginals (Dr. W. R. Horsfall and Dr. H. Lehmann), 41
Absolute Measurements in Magnetic Recording (E. D. Daniel and P. E. Axon), 519
Absorption of 3·5-m. Radiation in the Optical Emission Nebula, *NGC* 6357 (B. Y. Mills, A. G. Little and K. V. Sheridan), 178
Absorption of Ultrasound in Light Gases (W. Tempest and Dr H. D. Parbrook), 181
Absorption of Vitamin B_{12} from the Rat Intestine (Dr. E. S. Holdsworth and M. E. Coates), 701
Absorption (Initial), of Ions by Plant Tissue (Dr. A. B. Hope and Dr. R. N. Robertson), 43
Absorption (Ultra-Violet), of Oxygen in Organic Solvents (Allan U. Munck and Dr. Jesse F. Scott), 587
Absorption Spectra arising from the Photolysis of Lead Tetramethyl (Dr. C. L. Cook and J. G. Clouston), 1178
Absorption Spectra (Infra-Red), and Protein-Sugar Interactions (J. D. S. Goulden), 85
Abyssal Fauna—its Ecology, Distribution and Origin (Dr. Anton Fr. Bruun), 1105
Academic Freedom, 1189
Academic Freedom in Our Time (Prof. Robert M. MacIver), *review* by R. Brightman, 1190
Academic Freedom in the United States : The Development of (Prof. Richard Hofstadter and Walter P. Metzger), *review* by R. Brightman, 1190
Accademia Nazionale dei XL : Avogadro Centenary Commemoration Ceremony, 966
Accelerated Storage Tests for Dehydrated Vegetables (E. G. B. Gooding and R. B. Duckworth), 897
Accelerators : High-Energy (Prof. E. O. Lawrence), 470
  High-Energy Particle, in the United States, 470
Accident Proneness and Industrial Proficiency : Psychological Tests for (E. G. Chambers), (Medical Research Council, Memorandum No. 31), 313
Accounting (Financial) : Electronic Recording Machine for, 510
Aceto-Carmine Squash Preparations . A Rapid Method for Permanent (Dr. J. A. Rattenbury), 1185
Acetobacter capsulatum and its Associated Dextran-Dextrinase Enzyme System : Effect of Streptomycin on (Dr. B. H. Arnold and Dr. A. N. Hall), 44
Acetylcholinesterase Activity in Individual Nerve Cells : Quantitative Determination of (Dr. Ezio Giacobini and Dr. Joseph Zajicek), 185
Acher, Dr. R. : The Neurohypophysis, 1019
Acheson, Edward Goodrich (1856–1931), 412, *erratum*, 562
Achievements of Industrial Chemistry (Series of lectures in connexion with the seventy-fifth Annual Meeting of the Society of Chemical Industry), 609
Achtheres percarum Nordmann in English Waters · Occurrence of (J. P. Harding and the late F. W. K. Gervers), 664
Ackerknecht, Prof. Erwin H. : A Short History of Medicine, *review* by Dr. Charles Singer, 909
Acland, Brigadier P. B. E. : Re-appointed a member of the National Parks Commission, 167
Acoustical Society of America · Fifty-first Meeting, 968
Acoustics : Second International Congress on, 968
Acoustics for Aeronautical Engineers : Course on (University of Southampton), 464
l'Acoustique des Orthoptères : Colloque sur, Jouy-en-Josas, 5–8 Avril 1954 (Annales de l'Institut National de la Recherche Agronomique, Série C, Annales des Épiphyties), (René-Guy Busnel), *review* by Dr. P. T. Haskell, 403
Acrosome Formation in Bandicoot Spermiogenesis (K. W. Cleland), 387
Actinic Degradation of Cotton : Effect of some White Pigments on the (W. R. Hindson and P. G. Kelly), 1241
Action of Ascorbic Acid on Corticotropin (M. L. Dedman, T. H. Farmer and Prof. C. J. O. R. Morris), 1082 ; (Dr. M. Holzbauer), 1082
Action of an Autolytic Enzyme of *Bacillus subtilis* on the Cell-Wall (Masayasu Nomura and Junko Hosoda), 1037
Action of Auxin : Chelating Agents as Plant Growth Substances—a Possible Clue to the Mode of (Dr. O. V. S. Heath and Miss J. E. Clark), 1118
Action of Cardiac Glycosides : A Method for Determining the Duration of (M. Rand and Anne Stafford), 278
Action of Chlorpromazine on Oxidative Phosphorylation of Liver and Brain Mitochondria (Magdalena Berger, H. J. Strecker and Prof. H. Waelsch), 1234
Action of 2 : 4-Diamino-5-phenyl-thiazole Hydrochloride (Daptazole or Amiphenazole) · A Possible Mode of (A. Shulman), 703
Action in the Field of Nuclear Energy : Possibilities of (Working Party on Nuclear Energy), (Organization for European Economic Co-operation), 380
Action of Isoniazid : Mode of (Prof. Adrien Albert), 525
Action of *Iso*nicotinic Hydrazide : Mode of (Prof. S. D. Rubbo, Janice Edgar, Dr. J. Cymerman-Craig, G. N. Vaughan and D. Willis), 480
Action of Phosphohexoseisomerase : Thermodynamic Aspects of the (F. Bruns and S. Okada), 87
Action (A Stimulatory), of Indole-3-Acetic Acid on the Uptake of Amino-Acids by Plant Cells (Leonora Reinhold and R. G. Powell), 658
Action Potentials from Internal Laryngeal Muscles during Phonation (K. Faaborg-Andersen and Dr. Fritz Buchthal), 340
Activation Analysis using Low-Level Neutron Sources : Determination of Chromium, Vanadium and Tungsten by (Prof. M. Huaringa), 85
Active Transport of Sodium in the Isolated, Short-circuited Frog Skin : Oxygen Consumption and (Dr. K. Zerahn), 937
Activity : Changes in the Dimensions of Nuclei of Neurones with (Dr. M. R. A. Chance, A. J. Lucas and Dr. J. A. H. Waterhouse), 1081
Adachi, Susumu : New Amino-Acid—Glycosides isolated from Tryptic Hydrolysates of Milk Products, 936
Adair, Dr. G. S. (Boardman, N. K., and) : Isolation of Two Myoglobins from Horse-heart Extracts and the Determination of the Molecular Weight of the Main Component, 1078
Adam, Prof. N. K. : *Obituary* of Prof. D. R. Boyd, 259
Adams, C. D., and Alston, A. H. G. : Pteridophyta in the Gold Coast, 214
Adams, C. W. : Small Computers in a Large World, 462
Adams, G. F · Elected to the board of directors of A. Gallenkamp and Co., Ltd., 17
Adams, G. K. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 218 ; work of, 218
Adams, Roger, and others (edited by) : Organic Reactions, Vols. 7 and 8, *review* by Prof. John Read, 249
Adams, Dr. Walter Sydney : *Obituary* by Prof. F. J. M. Stratton, 1201
Adamson, Dr. D. W., and others : New Series of Ganglion-blocking Agents, 523
Adcock, L. H., and Gray, Prof. C. H. : Metabolism of Sorbitol, 329
Adcock, N. C., and Ford, A. W. : Electrical Equipment of Aircraft, 1211
Adenine-8-^{14}C : Uptake of, by Whole and Fractional Amœbæ (Walter Plaut and Ronald C. Rustad), 89
Adenine and Uracil : Incorporation of, into Ribonucleic Acid during Enzyme Induction in Resting Yeast (Prof. H. Chantrenne), 579
Adenosine Diphosphate : Enzymic Synthesis and Properties of a Polynucleotide from (Dr. Roland F. Beers, jun.), 790
Adkins, B., and others : Electrical Equipment of Aircraft, 1211
Administration of Research (Proceedings of the Ninth Annual Conference at Northwestern University Technological Institute on the), 676
Admiralty : Student-Apprenticeship Scheme, 215
Adolescence : Growth at (Dr. J. M. Tanner), *review* by Dr. J. S. Weiner, 860
Adolescent : Education of the, 149
Adrenal Ascorbic Acid-depleting Activity of Pituitary Extracts : Inactivation of the, by Ascorbic Acid (Dr. Marg Holzbauer and K. Walter), 379
Adrenal Cortex : Influence of the, on Wool Growth and its relation to 'Break' and 'Tenderness' in the Fleece (H. R. Lindner and Dr. K. A. Ferguson), 188
Adrenergic Axons : Evidence for the Presence of Noradrenaline in Submicroscopic Structures of (Prof. U. S. von Euler and N.-Å. Hillarp), 44
Adrenergic Sweating in Cattle (G. C. Taneja), 482
Adsorption of Carbon Dioxide at −79° C. on High-Silica Sands (H. D. Segrove), 987
Adsorption of Trace Amounts of Cations on Anion Exchange Resins by the Formation of Insoluble Salts (R. H. James and G. A. Welch), 183
Adsorption Spectrum of Nitrogen on Tungsten (Dr. Gert Ehrlich and Dr. T. W. Hickmott), 1045
Adult Life in a Scolytid Beetle : Flight-muscle Changes during (Dr. John A. Chapman), 1183
Adult Mosquito Tissue : Maintenance of, in a Tissue-Culture Medium (Dr. W. E. Beckel), 53[illegible]
Adults of Mosquitoes : Uptake of Radioactive Phosphorus by Larvæ and (L. J. Bruce-Chwatt and Dr. J. Hayward), 661
Advanced Courses at Technical Colleges : Awards for, 607
Advanced Courses in Technology (London and Home Counties Regional Advisory Council for Higher Technological Education, Booklet on), 364
Advanced Technology : Colleges of, 1204
Advisory Council of Agriculture, Animal Health and Forestry (Colonial) : Amendment of the terms of reference, 966
Advisory Council on Scientific Policy (Committee on Scientific Manpower) : Report on the Recruitment of Scientists and Engineers by the Engineering Industry, 51
Advisory Group for Aeronautical Research and Development : Monograph No. 6, Collected Papers on Aviation Medicine, presented at Aeronautical Panel Meetings of the AGARD, Paris, *review* by Wing-Comdr. F. Latham, 57

Aedes aegypti (L.) : Observations on Pool and Capillary Feeding in (Prof. Fergus J. O'Rourke), 1087
Aerated Culture Studies (Small-scale) : Magnetically Induced Vortex for (C. R. Newing and A. K. MacLeod), 939
Aerial Photogrammetry : Theory and Practice of (French National School for Geographical Sciences, Course on), 831
Aerobacter sp. : Occurrence and Nature of an Amœba Excystment Factor produced by (Dr. B. N. Singh, Miss S. Mathew and M. Sreenivasaya), 621
Aerobic Oxidation of Unsaturated Fatty Acids : Metal Ion Catalysis and Polarity of Environment in the (Dr. N. Uri), 1177
Aerodynamics of the Sea Surface : Statistics and (Royal Meteorological Society Symposia on), 62
Aeronautical Engineering at Belfast, 507
Aeronautical Engineers : Acoustics for (Course on, at the University of Southampton), 464
Aeronautical Research and Development, Advisory Group for : Monograph No. 6, Collected Papers on Aviation Medicine, presented at Aeronautical Panel Meetings of the AGARD, Paris, *review* by Wing-Comdr. F. Latham, 57
Aeronautical Society, Royal : Honorary fellowship conferred on Sir Roy Dobson and Dr. Hugh L. Dryden, 919
  Awards, 919
  Election of Officers for 1956 57, 1112
Aesculin : Splitting of, by Yeasts (J. A. Barnett and Dr. T. Swain), 133
Africa : Custom and Conflict in (Prof. Max Gluckman), *review* by Dr. E. R. Leach, 1098
Africa (East) : Zoonoses in (East African Medical Research Scientific Advisory Committee Conference on), 406; (Dr. K. C. Willett), 948
Africa (East) High Commission : Appointment of D. L. Johns as senior scientific officer, East African Tsetse and Trypanosomiasis Research and Reclamation Organization, 70
  Appointment of M. J. Cawderry-Hope as scientific officer, East African Tsetse and Trypanosomiasis Research and Reclamation Organization, 70
  Appointment of G. A. H. McClelland as scientific officer, East African Veterinary Research Organization, 70
  Annual Report for 1954–55 of the East African Agricultural and Fisheries Research Council, 509
  Appointment of D. W. Brocklesby as veterinary research officer (protozoologist), 561
  Appointment of J. Brazell as director of the East African Meteorological Department, 831
  Appointment of J. F. McCloy as senior scientific officer, East African Industrial Research Organization, 831
  Annual Report for 1954–55 of the East African Industrial Research Organization, 881
  Appointment of M. Dagg as scientific officer, 1112
  Appointment of Miss S. J. Darke as medical research officer, grade III, 1112
Africa (Eastern and North-Eastern) : Birds of (C. W. Mackworth-Praed and C. H. B. Grant), *review* by Sir Landsborough Thomson, 203
Africa (South) : Deoxyribonucleic Acid Deficiency in the Mature Egg Nucleus of *Aloe davyana* in (Dr. S. Krupko and A. Denley), 92
  The Striped Marlin (*Makaira audax* Phillipi) in (Prof. J. L. B. Smith), 758
African Honey-Guides (Dr. Herbert Friedmann), 173
African (East) Agricultural and Fisheries Research Council : Annual Report for 1954–55, 509
African (East) Industrial Research Organization : Appointment of J. F. McCloy as senior scientific officer, 831
  Annual Report for 1954–55, 881
African (East) Medical Research Scientific Advisory Committee : Annual Scientific Conference (Zoonoses in East Africa), 406
African (East) Meteorological Department : Appointment of J. Brazell as director, 831
African (East) Mosquitoes : Rhythmic Biting Activity of certain (Dr. A. J. Haddow), 531
African (East) Tsetse and Trypanosomiasis Research and Reclamation Organization : Appointment of D. L. Johns as senior scientific officer, 70
  Appointment of M. J. Cawderry-Hope as scientific officer, 70
African (East) Veterinary Research Organization : Appointment of G. A. H. McClelland as scientific Officer, 70
African (North) Prehistory, *review* by M. C. Burkitt, 1006
African (South) Bantu Men : Reduction to Normal Levels of the High Erythrocyte Sedimentation-Rates in Apparently Healthy (A R. P. Walker, D. C. Fletcher, P. A. Reynolds, I. Bersohn and E. D. Sonnenfeld), 480
African (South) Council for Scientific and Industrial Research : Ninth Annual Report (1953–54), 512
African (West) Cacao Research Institute, Gold Coast : Appointment of D R. Glendinning as scientific officer, plant breeder, 1207
African (West) Council for Medical Research, Nigeria : Appointment of W. J. Bell as special grade medical research officer, 736
  Appointment of B. O. L. Duke as medical research officer, grade I, Western Region, 1207
African (West) Institute for Trypanosomiasis Research, Nigeria : Appointment of D. G. Godfrey as scientific officer (parasitologist), 1207
African (West) Stored Products Research Unit, Department of Marketing and Exports, Federation of Nigeria : Appointment of L. A. W. Hayward as principal scientific officer, 70
l'Afrique : Préhistoire de (Prof. Raymond Vaufrey), Tome I, Le Maghreb, *review* by M. C. Burkitt, 1006
Afrique Centrale, Institut pour la Recherche Scientifique en : Sixième Rapport Annuel (1953), 971
Agar Plates (Serum) : Production of Opacity on, by some Strains of *Staphylococcus aureus* (A. J. H. Tomlinson and M. T. Parker), 895
AGARD Aeromedical Panel : Anthropometry and Human Engineering—a Symposium on Anthropometry, Human Engineering and Related Subjects on May 3–4, 1954, in Scheveningen, The Netherlands, *review* by Wing-Comdr. F. Latham, 350
Agard-Evans, Dr. B. : Documentation of Applied Chemistry, 169
Agassiz Medal of the National Academy of Sciences awarded to Prof. Alfred C. Redfield, 924
Age : Connective Tissue and its Changes with (British Society for Research on Ageing Conference on), 467
Age-Group Bulge and its Possible Effect on University Policy (Universities of Great Britain and Northern Ireland Conference on), 115
Age-hardened Alloy : Slip during Fatigue of an (T. Broom and V. N. Whittaker), 486
Ageing, British Society for Research on : Conference on Connective Tissue and its Changes with Age, 467
  Joint meeting with Dutch gerontologists, 1159
Ageing in Industry (F. Le Gros Clark and Agnes C. Dunne), *review* by Prof. John Cohen, 449
Aggregation of Spherical Particles (G. W. Hastings, D. W. Ovenall and Dr. F. W. Peaker), 1091
Agnew, Dr. L. R. C., and Mayer, Jean : Mechanism of Anorexia in Vitamin-deficient Hyperphagic Animals, 1235
Agricola's Position in Science (President Herbert C. Hoover and Mrs. Hoover), 166
Agricola, Georgius : De Natura Fossilium (translated from the first Latin edition by Mark Chance Bandy and Jean A. Bandy), *review* by Mrs. Joan M. Eyles, 1144
Agricola (Georgius) 1494–1555 zu seinem 400 Todestag, 21 November 1955, *review* by Mrs. Joan M. Eyles, 1144
Agricultural Department, Kenya : Appointment of A. R. Melville as chief research officer, 831
Agricultural Economics, Husbandry, Statistics and Agricultural and Dairy Engineering : Postgraduate Scholarships in (Ministry of Agriculture, Fisheries and Food, and the Department of Agriculture for Scotland), 415
Agricultural Engineering : Scholarships in (Institution of British Agricultural Engineers), 511
Agricultural Engineers (British), Institution of : Scholarships in Agricultural Engineering, 511
Agricultural Exhibits : Identification and Preservation of (John W. J. Higgs), 1071
Agricultural History Society, British : Annual Meeting, 1071
Agricultural History Society (British), and the Association of Agriculture : Conference on Farming History in Great Britain, 171
Agricultural Improvement Council for England and Wales : Appointment of Prof. E. G. White as a member, 167
Agricultural Librarians and Documentalists, International Association of : *Quarterly Bulletin*, No. 1, 510
Agricultural Research : The Evolution of (Sir William Slater), 651
Agricultural Research in Britain : Government Support of, 68
Agricultural Research in Scotland, 607
Agricultural Research Bill, 212
Agricultural Research Council : Appointment of Dr. R. F. Gordon as adviser on poultry research, 877
  Plant Breeders' Conference, 1113
Agricultural Research Council (Animal Health Trust and the) : Financial co-operation for the Houghton Poultry Research Station, 212
Agricultural Research Institute of the United States National Academy of Sciences : Fourth Annual Meeting, 117
  Election of Officers, 117
  Symposium on Corn in the American Economy, 117
Agricultural Science : Third Easter Symposium in (University of Nottingham), 215
Agricultural Society of England, Royal : Research Medal for work on Agriculture, 17
Agricultural and Dairy Engineering : Postgraduate Scholarships in Agricultural Economics, Husbandry, Statistics and (Ministry of Agriculture, Fisheries and Food, and the Department of Agriculture for Scotland), 415
Agricultural and Horticultural Research Station (the National Fruit and Cider Institute), Long Ashton : Annual Report for 1954, 322
Agriculture : Fellowships in (Rockefeller Foundation Awards), 977
  The Genotype in (Dr. T. R. Mehta), 214
  Geographical Exploration and (K. V. Zvorykin and G. M. Ignat'ev), 875
  Handbook of Food and (edited by Fred C. Blanck), *review* by Sir John Russell, 349
  Radioisotopes in Biology and (C. L. Comar), *review* by Dr. E. H. Belcher, 638
  The Relation of Pure to Applied Research in, 651
  Research Medal for work on (Royal Agricultural Society of England), 17
Agriculture in the University College of the Gold Coast (Prof. John Phillips), 610
Agriculture, Association of (British Agricultural History Society and the) . Conference on Farming History in Great Britain, 171
Agriculture, Department of (Gold Coast) : Appointment of J. Bowden as principal specialist, 1207
Agriculture for Scotland, Department of (Ministry of Agriculture, Fisheries and Food, and the) : Postgraduate Scholarships in Agricultural Economics, Husbandry, Statistics, and Agricultural and Dairy Engineering, 415
Agriculture, Fisheries and Food, Ministry of : Scholarships, 364
  Bulletin No. 165, Weather and the Land, 569
  Bulletin No. 56, Poultry Housing, fifth edition, 1111
Agriculture, Fisheries and Food, Ministry of, and the Department of Agriculture for Scotland : Postgraduate Scholarships in Agricultural Economics, Husbandry, Statistics, and Agricultural and Dairy Engineering, 415
Ahmed, I. A. (Alim, Dr. K. A., and) : Effects of Climate on Body Temperature and Respiration-rate of Buffaloes and Friesian Cattle, 900
Ainsworth, Dr. G. C. : Agostino Bassi (1773–1856), 255
Air (Upper) : 200 Miles Up, the Conquest of the (J. Gordon Vaeth), second edition, *review* by G. R. Noakes, 862
Air-transmitted Shock Wave in Muscular Tissue : Propagation of an (Carl-Johan Clemedson, Arne Jonsson and Hjalmar Pettersson), 380
Air Concentration of Radioactive Fission Products and Fallout : Relationship between (I. H. Blifford, jun., L. B. Lockhart, jun., and R. A. Baus), 990
Air Force (Royal) : Man-power in the (Nigel Birch), 560 ; (G. S. de Freitas), 560 ; (Dr. A. D. D. Broughton), 560

INDEX

Air Force Cambridge Research Center (Geophysics Research Directorate of the) : Second Annual Guenter Loeser Memorial Lecture (Dr. Robert G. Breene, jun.), 922
Air Ministry (Meteorological Office) : Publication 588, British Rainfall during 1953 (Ninety-third Annual Volume of the British Rainfall Organization), 313
  Annual Report of the Director for 1954–55, 519
  Geophysical Memoir 96, The Free Atmosphere in the Vicinity of Fronts—Analysis of the Observations by the Meteorological Research Flight, 1950–52 (J. S. Sawyer), 656
Air Ministry (Meteorological Office), and the Central Office of Information : Your Weather Service, revised edition, 1158
Aircraft : Electrical Equipment of (Institution of Electrical Engineers Convention on), 1210
Aitken, Prof A. C. : *Obituary* of Sir Edmund Whittaker, 730
Akino, Miki (Isaka, Saburo, and) Effect of Copper Cyanide upon the Formation *in vitro* of Melanin, 184
Akkadian Tablets from the Middle East : Old (Prof Ignace J Gelb), 735
Alarcón, Adolfo : Appointed regional officer for Mexico, Central America and the Caribbean of the United Nations Food and Agriculture Organization, 70
Albany Medical College of Union University, U.S.A. : Grant of 500,000 dollars from the Commonwealth Fund of New York, for medical education, 1064
Albemarle, Countess of : Appointed a member of the University Grants Committee on matters relating to academic salaries only, 364
Albert, Prof. Adrien : Mode of Action of Isoniazid, 525
Albert, Prof Adrien, and Rees, C. W. : Avidity of the Tetracyclines for the Cations of Metals, 433
Albertsson, Per-Åke : Chromatography and Partition of Cells and Cell Fragments, 771
Alcock, Margaret, and Cannell, J. S. : Temperature Effects in the Paper Partition Chromatography of Sugars, 327
Alcohol in the Liver of the Rat : Effect of Blocking the Reticulo-endothelial System on the Storage of Vitamin A Ester and (Dr. S. Krishnamurthy and J. Ganguly), 575
Alcohols : Photochemical Oxidation of, by Dichromate (Dr. E. J. Bowen), 889
  Transfer of Hydrogen from, to Quinones (Dr. C. F. Wells), 483
'Alcomax II *S.C.*', III *S.C.*, and IV *S D.*, 510
Aldehydes (Unsaturated) : Ultrasonic Relaxation in (M. S. de Groot and John Lamb), 1231
Aldohexoses : A New Method for Determining Ketohexoses in the presence of (M. A. Jermyn), 38
Alexander, H. G. : Birds of the Kathiawar Peninsula, India, *review*, 547
  Awarded a Commonwealth Fund General Fellowship, 735
Algal Chloroplastin : Molecular Weight of (J. J. Wolken and F. A. Schwertz), 136
Alim, Dr. K. A., and Ahmed, I. A. : Effects of Climate on Body Temperature and Respiration-rate of Buffaloes and Friesian Cattle, 900
Aliphatic Amines : Paper Chromatographic Identification of the 2 : 4-Dinitrophenyl-Derivatives of (I. M. Lockhart), 393
Alkali Halides : Empirical Relationship between the Excitation Energy of the *F*-band and Physical Constants for (M. Levy), 241
Alkaline Phosphatase : Histochemical Techniques for Electron Microscopy —(Dr. D. Brandes, H. Zetterqvist and H. Sheldon), 382
Alkaline Phosphatase in the Cell Wall of *Chlorella vulgaris* : An Electron Microscopical Study of the Histochemical Localization of (Dr. D. Brandes and Dr. R. N. Elston), 274
Alkaline Phosphatase in Madreporaria : Histochemistry of Mucopolysaccharide-like Substances and (Thomas Goreau), 1029
Alkaloid of *Dioscorea dumetorum* : A Convulsant (Prof. C. W. L. Bevan, Dr. J. L. Broadbent and J. Hirst), 935
Alkyl Sulphate Soaps : Polymorphism of (Prof. J. A. Prins and W Prins), 535
Alkyl Sulphonates : Tumour Growth-inhibitory (Prof. A. Haddow and Dr. W. C. J. Ross), 995
Allan, A H, and others : Frequency Variations in New Zealand of 16 kc./s. Transmissions from *GBR* Rugby, 178
Allan, D. W. : Kelvin on the Origin of the Earth, 801
Allan, D. W. (Jacobs, Prof. J. A., and) : The Thermal History of the Earth, 155
Allchin, Dr. F. R. (Gordon, Colonel D. H., and) : Rock Paintings and Engravings in Hyderabad, 1063
Allcock, G. McK. (Morgan, M. G., and) : Observations of Whistling Atmospherics at Geomagnetically Conjugate Points, 30
Allen, Dr. Clifford : Sexual Morality, *review*, 54
  Psychosomatic Research and Behavioural Science, 974
Allen, Prof. C. W. : Atlas du Ciel, *review*, 957
Allen, F. J., and Hunter, W. M. : Epoxide Resins, 963
Allen, Sir George : Science House, Pakistan, 1201
Allen, Prof. J. F. : The Age-Group Bulge and its Possible Effect on University Policy, 116
  Theoretical Physics—Symposium at St. Andrews, 268
Allen, Miss M. de Vere : Appointed laboratory technologist, Kenya, 561
Allen, Dr. N. P. : Elected a Fellow of the Royal Society, 558
Allen, P. E. M., and others : New Methods of Preparing Block Copolymers, 910
Allen, Prof. R. G D. : Population of British Universities in the 1960's—The Age-Group Bulge, 115
Allen, Dr. W. D. : Production and Utilization of Electromagnetically Enriched Isotopes, 159
Allergic Encephalomyelitis (Experimental), produced by Tubercle Bacillus Residues (J. Colover and Dr. R. Consden), 749
Allibone, Dr. T. E. : Peaceful Uses of Atomic Energy, 1102
Allison, Dr. Rhoda M. : Failure of Enforced Hibernation to Inhibit Breeding in the Frog (*Rana temporaria*), 342
Alloy (Age-hardened) : Slip during Fatigue of an (T. Broom and V. N. Whittaker), 486
Alloy (Alpha-Beta Titanium) : Metallographic Evidence of Mechanical Twinning in an (Dr. D. N. Williams), 436
Alloy (Low-) Steels : Hair-line Cracks in (A. Barker and A. Wainwright), 1136
Alloys : Research into the Welding of Aluminium and its (Aluminium Development Association, Research Report No. 27, prepared by Dr. W. I. Pumphrey), 568
Almén, O. E. G. : Production and Utilization of Electromagnetically Enriched Isotopes, 158
Aloe davyana in South Africa : Deoxyribonucleic Acid Deficiency in the Mature Egg Nucleus of (Dr. S. Krupko and A. Denley), 92
α-Particles : Bombardment of Glass by (D. G. Tuck), 434
α-Particles in Cloud Chambers : Apparent Velocity of (Prof. J. A. Prins and S. A. Hempenius), 487
Alpha-Beta Titanium Alloy : Metallographic Evidence of Mechanical Twinning in an (Dr. D. N. Williams), 436
Alston, A. H. G. (Adams, C. D., and) : Pteridophyta in the Gold Coast, 214
Alston (R. P.) Memorial Prize of the Royal Aeronautical Society awarded to D. P. Davies, 919
Alternative Responses : A Combinatorial Design for Experiments with (K. Strzemienski), 283
Altitudes (High) : Measurements of Natural Freezing Nuclei at (E. J. Smith, Dr. A. R Kassander and Dr. S. Twomey), 82
Alumina Trihydrate : A New (Robert A. Van Nordstrand, William P. Hettinger and Carl D. Keith), 713
Aluminium and its Alloys : Research into the Welding of (Aluminium Development Association, Research Report No. 27, prepared by Dr. W. I. Pumphrey), 568
Aluminium Development Association : Research Report No. 27, Research into the Welding of Aluminium and its Alloys (prepared by Dr. W. I. Pumphrey), 568
Aluminium Industry : The Chemical Background of the (Dr. T. G. Pearson), 462
Ambrose, D. : Modern Gas Analysis, *review*, 550
Ambrose, D., and Collerson, R. R. : Use of Gas-Liquid Partition Chromatography as a Preparative Method, 84
Ambrose, Dr. E. J. : Rheology of Proteins, 516
Ambrose, Dr. E. J., and others Differences between the Electrical Charge carried by Normal and Homologous Tumour Cells, 576
America : Predator Control in, 1157
  Theodore Roosevelt's (edited by Farida A. Wiley), *review* by Dr. L. Harrison Matthews, 813
America (Colonial) : Lewis Evans (1700–56), a Scientist in (Prof. George W. White), 1055
America (Latin) Mycological Collections : Second General Catalogue of (Unesco Centre for Scientific Co-operation), 921
America (North) : A Manual of the Dragonflies (Anisoptera) of (Prof. James G. Needham and Prof. Minter J. Westfall, Jr.), *review* by D. E. Kimmins, 450
  Mosquitoes of (North of Mexico), (Stanley J. Carpenter and Walter J. La Casse), *review*, 56
America's Wildlife in our National Refuges : Seeing (Devereux Butcher), *review* by E. M. Nicholson, 765
America and Great Britain : Sitka Spruce and Douglas Fir in, 1207
American Academy of Arts and Sciences : Continuation of the *Proceedings* under the title *Daedalus* 829
American Association for the Advancement of Science : Presidential Address, The Influence of Science on People (Dr. Warren Weaver), 694
  Symposium on Astronomical Photoelectric Photometry (edited by Frank Bradshaw Wood), *review* by Dr. A. H. Jarrett, 814
  Symposium at Boston, 1953, on Antimetabolites and Cancer (edited by Cornelius P. Rhoads) *review* by G. M. Timmis, 1007
American Chemical Society : Monograph Series No. 121, Hydrocarbons from Petroleum (An Account of the Work of the American Petroleum Institute Research Project 6), (Prof. Frederick D. Rossini, Beveridge J. Mair and Anton J. Streiff), *review*, 401
  Monograph Series No 127, The Chemistry of Synthetic Dyes and Pigments (edited by H. A. Lubs), *review* by Dr. S. Coffey, 498
American Economy : Corn in the (Agricultural Research Institute of the United States National Academy of Sciences Symposium on), 117
American Eyes : British Universities through, *review* by Prof. W. H. G. Armytage, 1005
American Institute of Electrical Engineers, and others : Conference on Magnetism and Magnetic Materials, 1065
American Institute of Mining and Metallurgical Engineers, and others : Conference on Magnetism and Magnetic Materials, 1065
American Journal of Physiology : Certain volumes to be reproduced by the Johnson Reprint Corporation, New York, by permission of the American Physiological Society, 877
American Methods of Materials Testing, *review* by K. J. Pascoe, 248
American Nature Association (prepared by the National Conservation Committee of the National Association of Biology Teachers in conjunction with the) : Handbook for Teaching of Conservation and Resource-Use, *review* by Dr. Maurice Ashby, 678
American Numismatic Society : Notes and Monographs No. 129, Chemical Composition of Parthian Coins (Earle R. Caley), 23
American Petroleum Institute : 'Project 6' of the, *review*, 401
American Philosophical Society : *Proceedings*, Vol. 99, No. 6, Studies on Benjamin Franklin, 413
American Physical Society : *Bulletin* to be published as a separate Journal, 511
American Physical Society, and others : Conference on Magnetism and Magnetic Materials, 1065
American Physiological Society : Permission given to the Johnson Reprint Corporation, New York, to reproduce certain volumes of *Physiological Reviews* and the *American Journal of Physiology*, 877
American Prairies (Dr. W. R. Wedel), 1157
American Universities : Freedom in, *review* by R. Brightman, 1190
American (North) Indians and in Japanese : The Blood Group Antigen *Diego* in (Marion Lewis, Hiroko Ayukawa, Dr. Bruce Chown and Dr. Philip Levine), 1084
American (North) Mosquitoes, *review*, 56
American (North-) Plant Taxonomy, *review* by Prof. T. G. Tutin, 546
American (North-West) Forests in relation to Sylviculture in Great Britain : Studies of (R. F. Wood), 1207
American (South) Orthoptera Cytogenetics of (Dr. Francisco A. Saez), 490
Amines (Aliphatic) : Paper Chromatographic Identification of the 2 : 4-Dinitrophenyl Derivatives of (I. M. Lockhart), 393
Amino-acid Composition of Hæmoglobin E (Prof. J. H P Jonxis, T. H. J. Huisman, P. C. van der Schaaf and H. K. Prins), 627

Amino-Acid Content (Free), of the Lymph (P. Braun, M. Foldi, S. Kisfaludy and Gy. Szabó), 1133
Amino-Acid Metabolism of *Nicotiana* Leaves after Removal from Plant (Shri Ranjan and M. M. Laloraya), 235
Amino-Acid Patterns of Urine and Blood Plasma in a Cystinuric Labrador Dog (C. W. Crane and A. W. Turner), 237
Amino-Acid Sequence in a Hypertensin (Dr. D. F. Elliott and Dr. W. S. Peart), 527
D-Amino-Acid in the Diencephalon Part of the Brain : Inhibitory Action of Chlorpromazine on the Oxidation of (Dr. Kunio Yagi, Toshiharu Nagatsu and Takayuki Ozawa), 891
Amino-Acid—Glycosides (New), isolated from Tryptic Hydrolysates of Milk Products (Susumu Adachi), 936
Amino-Acids : A Stimulatory Action of Indole-3-Acetic Acid on the Uptake of, by Plant Cells (Leonora Reinhold and R. G. Powell), 658
Amino-acids (Free), in Normal and Iron-deficient Plants of *Hibiscus esculentus* L. Chromatographic Detection of (S D Démétriadès), 95
Amino-acids of Silk Utilization of the Carboxyl Carbon of L-Phenylalanine for the Synthesis of the, by *Bombyx mori* (S. Bricteux-Grégoire, W G. Verly and Prof. M. Florkin), 1237
Amino-Acids, Organic Acids and Sugars in Freeze-dried Apricots : Reactions between (E. F. L. J. Anet and T. M. Reynolds), 1082
Aminomalonic Acid Decarboxylase—a New Enzyme (Kensuke Shimura, Hideo Nagayama and Aiko Kikuchi), 935
Amino-sugar : An Unidentified, present in Cell Walls and Spores of various Bacteria (R. E. Strange and F. A. Dark), 186
Amiphenazole : A Possible Mode of Action of 2 : 4-Diamino-5-phenylthiazole Hydrochloride—Daptazole or (A. Shulman), 703
Ammonium Salts (Quaternary) : Effect of the Anion on R_F Values of (Dr. Herbert Sheppard and Barbara Sachs D'Asara), 1089
Amniotic Ectoderm (Bovine) · Growth of, as a Cell Monolayer on Glass and its Use as a System for Virus Multiplication (T. W. F. Pay), 752
Amœba Excystment Factor produced by *Aerobacter* sp. : Occurrence and Nature of an (Dr. B. N. Singh, Miss S Mathew and M Sreenivasaya), 621
Amœbæ (Whole and Fractional) : Uptake of Adenine-8-^{14}C by (Walter Plaut and Ronald C. Rustad), 89
Amœbiasis : Diagnosis of (Sir Philip Manson-Bahr), 1207
Amos, Dr. A. J. Phospholipids in Foods, 565
Amos, G. H. C. : Appointed agricultural and food adviser to the High Commissioner for the United Kingdom in Ottawa, 736
Amphithallism in Fungi (M. Eileen Kennedy and Prof. J. H. Burnett), 882
Amplifiers Transistor Audio (Richard F. Shea), *review* by D. D. Jones, 864
Amylose : Oxidation as a Source of 'Anomalies' in (H. Baum, Dr. G. A. Gilbert and N. D. Scott), 889
Amytal : Effect of $\beta\beta$-Methylethyl Glutarimide and, on Rat-Liver Mitochondrial Respiration (Prof. O. Jalling), 330
Anabaena cylindrica Lemm : Vitamin B_{12} Activity of *Chlorella vulgaris* Beij and (F. Brown, Dr. W. F. J. Cuthbertson and Dr. G. E. Fogg), 188
Anæmia : Diet and (Nutrition Society Symposium on), 878
Anæmias (Familial Hæmolytic) : Red-Cell Survival in (Robert L. Evans), 839
Anaerobic Deamination of D-Glucosamine by Bacterial and Brain Extracts (Dr. P. Faulkner and Prof. J. H. Quastel), 1216
Analogue of Enzyme Action : The 'Chain Effect', a Possible (Dr. D. G H. Ballard and Dr. C. H Bamford), 477
Analogy Computation Meeting : International (Dr. G. Liebmann), 20
Analysing Ionospheric Movement Records : A New Method of (Dr. G. L. Rogers), 613
Analysis : Colorimetric Methods of, including some Turbidimetric and Nephelometric Methods (Dr. Foster Dee Snell and Dr. Cornelia T. Snell), Vol. 3, Organic (1) ; Vol 4, Organic (2), *review* by J. King, 201
  Modern Gas (Paul W. Mullen), *review* by D. Ambrose, 550
  Numerical (Prof Zdenek Kopal), *review* by Dr. J. C. P. Miller, 953
  Organic (edited by John Mitchell, Jr., I M. Kolthoff, E. S. Proskauer and A. Weissberger), Vol. 2, *review* by Dr. G. M. Bennett, 546
  Qualitative Inorganic (Prof. G. Charlot), translated from the fourth French edition by Dr. R. C Murray, *review* by Prof. J. R. Partington, 498
  Servomechanism (George J. Thaler and Robert G. Brown), *review* by R. Neumann, 766
Analysis of Crystalline Hæmoglobin Derivatives by Paramagnetic Resonance (J. E Bennett and Dr. D. J. E Ingram), 275
Analysis of Drugs and Chemicals (Dr. Norman Evers and Wilfred Smith), *review* by J. R. Nicholls, 597
Analysis of Weather Charts, *review* by Dr. J. M. Stagg, 956
Analysis (Activation), using Low-Level Neutron Sources : Determination of Chromium, Vanadium and Tungsten by (Prof. M. Huaringa), 85
Analysis (Chemical) : Colorimetric Methods of, *review* by J King, 201
Analysis (Ecological), of the Interbreeding of Crested Titmice in Texas (Keith L. Dixon), 1213
Analysis (Meteorological) : Principles of (Walter J. Saucier), *review* by Dr. J. M. Stagg, 956
Analysis (Organic) : Newer Techniques in, *review* by Dr. G. M Bennett, 546
Analysis (Qualitative Inorganic) : A New Scheme of, *review* by Prof. J R. Partington, 498
Analysis (Radioactivation), of Phosphorus in Iodine (J. A. James and D. H. Richards), 1230
Analysis (Spectrochemical), with Time-Resolved Spark Spectra (Dr. Á. Bardócz and P. Varsányi), 222
Analyst · The—Chemist, Technician or Magician ? (T. McLachlan), 464
Analytical Chemistry, Society for Eighty-second Annual General Meeting, 651
  Election of Officers, 651
  Bernard Dyer Memorial Lecture (Sir William Slater), 651
Analytical Psychology, Journal of, Vol. 1, No 1 (Society of Analytical Psychology), 17
Anaphylactic Shock and Compound 48/80 : Effects of, on the Mast Cells of the Guinea Pig Lung (Dr. Ivan Mota and Itamar Vugman), 427
Anatomy at Cape Town, 873
Ancient Education (Prof. William A. Smith), *review* by A. C. F. Beales, 296
Anderson, G. W. : Appointed senior agricultural officer, Uganda, 1112
Anderson, Prof. H. L. . Enrico Fermi and his Contributions to Physics, 781
Anderson, Kathleen J. : Microbiology of Silage, 96
Andersson, Dr. B. : The Neurohypophysis, 1020
Andersson, Dr. G. · Production and Utilization of Electromagnetically Enriched Isotopes, 160
Andrade, Prof E. N. da C. : Simon Stevin, a Founder of Mechanics, *review*, 3
  The Scientific Work of Benjamin Franklin, 60
  Benjamin Franklin in London, 164
  Appointed by the Royal Society to deliver the Rutherford Memorial Lecture for 1957, 1113
  Obituary of Prof. Carl Râmsauer, 1154
André, Dr Torsten : Preparation of Tritium-labelled Dihydrostreptomycin, 379
Andrews, Dr. K W. : Mechanism of Phase Transformations in Metals, 420
Anet, E. F. L. J., and Reynolds, T. M. : Reactions between Amino-Acids, Organic Acids and Sugars in Freeze-dried Apricots, 1082
Aneuryn-Evans, G. B. : Appointed statistician, Federation of Nigeria, 1112
Angiosperms · Septate Fibres in, and their Length (K. A. Chowdhury, S. K. Purkayastha, S. S. Ghosh and J. S. Sond), 1243
Angola · A Marlin in, with a Note on *Makaira herschelii* (Gray), 1838 (Prof. J. L B. Smith), 1246
Angus, A. : Appointed plant pathologist, Northern Rhodesia, 831
Angwin, Sir Stanley : Elected an honorary member of the Institution of Electrical Engineers, 261
Animal Behaviour : Imprinting in (Dr. R. F. Ewer), 227
  Sources of (Prof. G. P. Wells), 372
Animal Health Trust and the Agricultural Research Council : Financial co-operation for the Houghton Poultry Research Station, 212
Animal Husbandry (Prof. J. E. Nichols), 607
Animal Hyaluronate (Sulphated) . Lipæmia Clearing Action of (Prof. Theodore Gillman, Michael Hathorn and Jack Penn), 894
Animal Populations . Insecticides and the Balance of (Dr. H. E. Hinton), 123
Animal Protein Factors of Casein : Orotic Acid as a Survival Factor in Rats Deficient in the (A. Rabbi, M Marchetti, R. Viviani and Prof. G. Moruzzi), 757
Animal Sounds : Recording of (Conference at the Pennsylvania State College), 314
Animal Sounds in the Sea (Marie Poland Fish), 1117
Animal Technicians : Ninth Annual Congress of (Laboratory Animals Bureau), 1198
Animal Trypanosomiasis : Prophylactic Activity of Suramin Complexes in (Dr. J. Williamson and Dr. R. S. Desowitz), 1074
Animal Tissue Culture · Plant and, *review* by Prof. R. J Gautheret, 719
Animal and Plant Cells : Cultivation of (Dr. Philip R. White), *review* by Prof. R. J. Gautheret, 719
Animals : The Expression of the Emotions in Man and (Charles Darwin), *review* by Prof. John Cohen, 247
  The Impact of Food Technology on the Nutrition of Man and (Scottish Group of the Nutrition Society Discussion on), 1199
  Learning in Man and (Section of Comparative Medicine of the Royal Society of Medicine Discussion on), 1147
  The Numbers of Man and (edited by J. B. Cragg and N. W. Pirie), *review*, 300
Animals (Domestic) : Responses of, to Infections of *Trypanosoma vivax*, *T congolense* and *T. brucei* (Prof. E. E. Edwards, J. M. Judd and F. A. Squire), 332
Animals (Laboratory) : Breeding of (Papers and Discussions at the Symposium organized by the Laboratory Animals Bureau), 69
  Infections in (Laboratory Animals Bureau Symposium on), 1198
Animals (Laboratory), Die : Why (Dr. W. Lane-Petter), 1198
Animals (Vitamin-deficient Hyperphagic) : Mechanism of Anorexia in (Dr. L. R. C. Agnew and Jean Mayer), 1235
Animals and Plants : Preservation of, by Drying from the Frozen State (Dr. D. A. L Davies and V. S G. Baugh), 657
Anion : Effect of the, on R_F Values of Quaternary Ammonium Salts (Dr Herbert Sheppard and Barbara Sachs D'Asaro), 1089
Anion Exchange Resins : Adsorption of Trace Amounts of Cations on, by the Formation of Insoluble Salts (R H. James and G. A. Welch), 183
Anionotropic Rearrangements : Steric Effects in (Prof. E. A. Braude, Dr. J. A. Coles, Dr. E. A. Evans and Dr. C. J. Timmons), 1167
Anisoptera : A Manual of the Dragonflies of North America (Prof. James G. Needham and Prof. Minter J. Westfall, Jr.), *review* by D. E. Kimmins, 450
Anisotropic Temperature Factors in Cubic Crystals (Dame Kathleen Lonsdale and Dr. H. Judith Grenville-Wells), 986
'Anomalies' in Amylose : Oxidation as a Source of (H. Baum, Dr. G. A. Gilbert and N. D. Scott), 889
Anopheles gambiae : Normal Resistance-levels of, to various Insecticides (Dr. J. R. Busvine), 533
Anopheles gambiae Giles : Ecology of (James G. Halcrow), 1103
  Insecticide Resistance in (R. Elliott and V. Ramakrishna), 532
Anorexia in Vitamin-deficient Hyperphagic Animals : Mechanism of (Dr. L. R. C. Agnew and Jean Mayer), 1235
Anorganischen Chemie : Lehrbuch der (begrundet von A F. Holleman), 34–36 Auflage, bearbeitet von Prof. Egon Wiberg, *review*, 641
Ansell, Dr. G B. : Neurochemistry, *review*, 720
Anson, M. L., and others (edited by) : Advances in Protein Chemistry, Vol. 9, *review* by Prof. J. A. V. Butler, 295
Antarctic . Meteorology and Geographical Features of the, 508
Antarctic Atmospheric Circulation (H. H. Lamb), 1076
Antarctic Ocean : Phytoplankton and Hydrography of the Pacific Part of the (Grethe Rytter Hasle), 616
Antenatal Sex Determination (Dr. Fritz Fuchs and Dr. Povl Riis), 330
Antennas : Elsevier's Dictionary of Television, Radar and, in Six Languages (compiled and arranged on an English alphabetical base by W. E. Clason), *review* by Dr R. L. Smith-Rose, 1099
Anterior Pituitary : Oxytocin as Stimulator for the Release of Prolactin from the (G. K Benson and Dr. S J. Folley), 700
Anthocyanin Pigment of Blackberry : Enzymatic Identification of the (Dr. H. T. Huang), 39
Anthropology, Psychology and Medicine : Research Films in Biology, (Anthony R. Michaelis), *review* by Prof. G. E. H. Foxon, 298
Anthropometry and Human Engineering : a Symposium on Anthropometry, Human Engineering and Related Subjects conducted by the AGARD Aeromedical Panel on May 3–4, 1954, in Scheveningen, The Netherlands, *review* by Wing-Comdr. F. Latham, 350

Antibiotics : Assay-Methods of (Dr. Donald C. Grove and Dr. William A. Randall); review by Dr. N. G. Heatley, 496
Antibiotics Annual, 1954–55—Proceedings of the Second Annual Symposium on Antibiotics (edited by Dr. Henry Welch and Dr. Felix Marti-Ibanez), *review* by Dr. N. G. Heatley, 496
Antibiotics and Mould Metabolites (Chemical Society Symposium on), 562, 1058
Antibody : Effect of, on the Respiratory Rate of *Trypanosoma vivax* (Dr. R. S. Desowitz), 132
Antibody (Intracellular) : Autoradiographic Localization and Measurement of, using Labelled Antigen (Dr. M. C. Berenbaum), 46
Antibody Formation : A Biological Factor inhibiting the Effect of Cortisone on (Kaare Berglund and Astrid Fagraeus), 233
Anti-Cancer Centre, Lille : Publication of *Cancerologie*, 413
Anti-competitive Inhibition Examples of (Dr. K. S. Dodgson, Dr. B. Spencer and K. Williams), 432
Anticoagulant Specificity and Physiologically Inactive Beta-Prothromboplastin (Dr. P. Fantl and Dr. R. J. Sawers), 1233
Antigen Determining Virulence in *Pasteurella pestis* (Dr. T. W. Burrows), 426
Antigen (Labelled) : Autoradiographic Localization and Measurement of Intracellular Antibody, using (Dr. M C. Berenbaum), 46
Antigen-Antibody Titrations in Gels : A New Quantitative Method for (Dr. Joseph G. Feinberg), 530
Antigens : Attempts at Hybridization of Chickens and Turkeys which are Tolerant of each others' (Margaret Ryle and M. Simonsen), 437
ABO Antigens in the Human Cornea (Dr. E. Nelken, Prof. I. C. Michaelson, Dr. D. Nelken and Prof. J. Gurevitch), 840
Antiglobulin Sera : Preparation of (F. Milgrom, T. Luszczynski and S. Dubiski), 329
Anti-Locust Research Centre Report for 1954–55, 365, 418
Antimetabolites and Cancer (edited by Cornelius P Rhoads), *review* by G. M. Timmis, 1007
Antiœstrogenic Potencies (Comparative), of Progesterone and 17 α-Hydroxyprogesterone (Dr. Elvira Mardones, Dusan Jadrijevic and Prof. A. Lipschutz), 478
Antiprotons (Prof. O. Chamberlain, Prof. E. Segrè, Dr. C. Wiegand and Dr. T. Ypsilantis), 11
Antiquities in Britain, *review* by W. F. Grimes, 547
Anti-tumour Agents (Section of Experimental Medicine and Therapeutics of the Royal Society of Medicine Symposium on), 511
Aphelenchoides sp. destroying Mushroom Mycelium (B. D. Moreton, M. E. John and J. B. Goodey), 795
Aphids : Transmission of the Potato Leaf-roll Virus by (M. F Day), 967
Apocynaceae : Latex of (J. van Die), 830
Apparatus (A New), for Cathodic Sputtering (L. Holland), 1229
Apparatus (Scientific Instruments and) : Handbook of (Physical Society), 874
Apparent Velocity of Alpha-Particles in Cloud Chambers (Prof. J. A. Prins and S. A. Hempenius), 487
Apparently Healthy South African Bantu Men : Reduction to Normal Levels of the High Erythrocyte Sedimentation-Rates in (A. R. P. Walker, D. C. Fletcher, P. A. Reynolds, I Bersohn and E. D. Sonnenfeld), 480
Apple Shoots . Auxin Transport in (F G. Gregory and C. R. Hancock), 510
Appleton, Sir Edward: Science and the Nation (Reith Lectures for 1956), 364
Appleyard, H M. : Fibre Microscopy, 516
Application of Nuclear Moments . Measurement and, *review* by Dr. B H. Flowers, 497
Application of Small Digital Computers : Design and (Proceedings of the Conference held by the Eastern Section of the Joint Computer Committee), 462
Applications of the Electron Microscope : Techniques and (Department of Engineering Physics of Cornell University Summer Laboratory Course on), 922
Applications of Physics : Principles and (Dr. Otto Bluh, in collaboration with Joseph Denison Elder), *review* by G. R. Noakes, 1051
Applications of Radioactive Isotopes in Industry and their Uses as Tracers (College of Technology, Bristol, in collaboration with the Regional Council for Further Education for the South West, Course on the), 1065
Applied Bacteriology, Society for : Summer Conference and Annual Meeting, 1018
Applied Biologists, Association of : Summer Meeting, 1065
Applied Biologists, Association of, and the Society of Chemical Industry Symposium on the Resistance of Insects to Insecticides, 355
Applied Chemistry . First International Congress on Documentation of (International Union of Pure and Applied Chemistry), 168
Applied Chemistry (Pure and) (Analytical Chemistry) : Fifteenth International Congress of, 653
Applied Chemistry (Pure and), International Union of First International Congress on Documentation of Applied Chemistry, 168
  Further Session of the Inorganic Nomenclature Commission, 464
Applied Chemistry (Pure and), International Union of (Commission on Macromolecules), and the Weizmann Institute of Science : International Symposium on Macromolecular Chemistry (Polymers, Biocolloids and Polyelectrolytes in Solution), 562, 1161
Applied Mechanics Ninth International Congress of, 653
Applied Mechanics (Theoretical and), International Union of, and the International Astronomical Union . I.A U. Symposium Series, No. 2, Gas Dynamics of Cosmic Clouds—a Symposium held at Cambridge, July 6–11, 1953 (edited by H. C van de Hulst and J. M. Burgers), *review* by Dr. F. D. Kahn, 352
Applied Physics : Introductory (Norman C. Harris and Edwin M. Hemmerling), *review* by G R. Noakes, 767
Applied Physics (Pure and), International Union of : Proceedings of the 1954 Glasgow Conference on Nuclear and Meson Physics (edited by E H. Bellamy and R. G. Moorhouse), *review* by Dr. J. C. Bower, 154
  Symposium on X-Ray Microscopy and Microradiography, 1065
Applied Physics (Pure and), International Union of (Joint Commission on Spectroscopy) : Meeting at Ohio State University, 693
Applied Research : The Relation of Pure to, in Agriculture, 651
Applied Solar Energy . World Symposium on, 110
Apricots (Freeze-dried) : Reactions between Amino-Acids, Organic Acids and Sugars in (E F. L. J. Anet and T. M. Reynolds), 1082
Approach (A New), to Biosynthesis, *review* by Dr. Kenneth McQuillen, 594
Approach (Rational), to Chemical Principles (Dr. John A. Cranston), second edition, *review* by J. A. V. B., 597
Aqueous Solutions : Effect of Solute Concentration in the Irradiation of, by Ionizing Radiations (Dr. G. R. A. Johnson, Dr. G. Scholes and Dr. J. Weiss), 883
Arakawa, Dr. H. : Statistics and Aerodynamics of the Sea Surface, 63
Arbeitsgemeinschaft Getreideforschung e.V., Detmold : Conference on Starch, 562
Arc Column (High-Pressure) : Formation of the, in Hydrogen (W. A. Gambling and Dr. H. Edels), 1090
Arc Temperatures : Determination of, using Shock Waves (D. Whittaker and Dr. H. Edels), 484
Archæology in the University of London, 15
Archæology of the Roman Empire at Oxford, 164
Archæology of Sussex (E. Cecil Curwen), second edition, *review* by Miles Burkitt, 301
Archæology (Prehistoric European), in London, 1062
Arcs in Vacuum (M. P. Reece), 089
Arctic and other Regions : Recent Soviet Research on Microbiology in the (W. G. Cass), 654
Arctic Lichen, *Siphula ceratites*, in Scotland (D. N McVean), 797
Arctic Ocean : Researches in the (Prof. G. E. MacGinitie), 1215
Ard, William B., and others : Microwave Detection of Metallic Ions and Organic Radicals in Plant Materials, 984
Arends, Dr. Tulio (Layrisse, Dr. Miguel, and) : The *Diego* Blood Factor in Chinese and Japanese, 1083
Arends, Dr. Tulio, and others : The *Diego* Blood Factor, 40
Arginine : Determination of (J W. Janus), 529
Argon (Solid) : Thermal Conductivity of, at Low Temperatures (Dr. G K. White and Dr. S. B. Woods), 851
Argonne National Laboratory, Ilinois Symposium on Spectroscopy, 737
Aristotle : Parva Naturalia (a revised Text with Introduction and Commentary by Sir David Ross), *review* by F I. G. Rawlins, 550
Armstrong, D. G., and Blaxter, K. L. : Heat Increments of Feeding in Ruminants, 1183
Armstrong Memorial Lecture of the Royal Society of Arts (Dr. B. K. Blount), 412
Armytage, Prof. W. H. G. : British Universities through American Eyes, *review*, 1005
Arndt, Dr. U. W. : Structure of Semi- and Non-Crystalline Materials, 121, *erratum*, 314
Arnold, A. H. M., and Ford, L. H. : Electrical Equipment of Aircraft, 1211
Arnold, Dr. B. H., and Hall, Dr. A. N. : Effect of Streptomycin on *Acetobacter capsulatum* and its associated Dextran-Dextrinase Enzyme System, 44
Arrested Growth in Arthropods, *review*, 907
Arresting *Paramecium* (Dr. C. Ellenby), 98
Arrow of Time (Prof. K. R. Popper), 538
Art : Michelangelo, a Study in the Nature of (Adrian Stokes), *review* by F. I. G. Rawlins, 451
Art of Science (Prof. L. C Beadle), 610
Artefacts ('Pearl-String'), in a Random Scatter of Spheres (J. H. Fessler), 439
Arthropods : Arrested Growth in, *review*, 907
  The Physiology of Diapause in (Dr. A. D. Lees), *review*, 907
Articles (Review) : Quotation of Titles of Papers in (Dr. Charity Waymouth), 98 ; (N. W. Pirie), 440 ; (Dr. Kenneth M. Smith), 464
Artificial Ice-forming Nuclei (B J. Mason and J. Hallett), 681
Artificial Rain-making in India : Proceedings of the Symposium on (Atmospheric Research Committee of the Council of Scientific and Industrial Research and the India Meteorological Department), 362
Arts, Royal Society of : Trueman Wood Memorial Lecture (Prof. E. N. da C. Andrade), 164
  E. F. Armstrong Memorial Lecture (Dr. B. K. Blount), 412
Arts et Métiers, Conservatoire National des (Department of Mechanics) : International Congress on Automation, 1018
Arts and Sciences in Education The Balance of, 1095
Arvy, Dr. Lucie : The Neurohypophysis, 1021
Ascites Carcinoma Cells (Ehrlich) : Immunological Studies with Protein Fractions isolated from (Dr. John S. Colter, Hilary Koprowski, Harris H. Bird and Kathryn Pfeister), 994
Ascites Tumours (Mouse) : Nucleic Acid Content and Distribution of Chromosome Number in Original and Sublines of Two (Dr. John S Colter, Harris H. Bird, Hilary Koprowski and Hilda B. Ritter), 993
Ascorbic Acid : Action of, on Corticotropin (M. L. Dedman, T. H. Farmer and Prof. C. J. O. R. Morris), 1082 ; (Dr. M. Holzbauer), 1082
  Inactivation of the Adrenal Ascorbic Acid-depleting Activity of Pituitary Extracts by (Dr. Marg Holzbauer and K. Walter), 379
Ascorbic Acid-depleting Activity of Pituitary Extracts : Inactivation of the Adrenal, by Ascorbic Acid (Dr. Marg. Holzbauer and K. Walter), 379
Ashby, Sir Eric : Australia, *review*, 404
Ashby, H K. : Appointed senior agricultural officer, grade A, Federation of Malaya, 736
Ashby, Dr. Maurice : Nature Conservation for Teachers, *review*, 678
  The Mechanism of Evolution, *review*, 864
Asia (South) : International Conference on Mathematical Education in, 694
Asiatic Magnolias in Cultivation (G. H. Johnstone), *review* by Sir Edward Salisbury, 549
Askonas, Dr. B. A. : The Structure of Nucleic Acids and their Role in Protein Synthesis, 603
Aslib (Textile Group), and the Textile Institute : Conference on Textile Information—Uses and Needs, 119
L-Asparaginase : Inhibition of in Extracts of *Mycobacterium phlei* by D-Asparagine (Dr. Nathan Grossowicz and Yeheskel S. Halpern), 623
D-Asparagine : Inhibition of L-Asparaginase in Extracts of *Mycobacterium phlei* by (Dr. Nathan Grossowicz and Yeheskel S Halpern), 623
Aspects (New), of Non-Destructive Testing : Physics of some (Non-Destructive Group of the Institute of Physics Summer Meeting on), 1113
Aspermic Human Semen: Zinc in (C. A. Mawson and M. Isabel Fischer), 190

Assay of Possible Carcinogenic Hydrocarbons from Cigarette Smoke (M. J. Lyons), 630
Assay Methods of Antibiotics (Dr. Donald C. Grove and Dr. William A. Randall), *review* by Dr. N. G. Heatley, 496
Assessing the Moisture exuded through the Skin of Cattle : A Simple Method of (R. M. Mabon), 284
Assimilation of Berberine by Bacteria (Prof. P. H. H. Gray and R. A. Lachance), 1182
Association Internationale des Sociétés de Microbiologie (Section de Microbiologie des Produits Alimentaires) : Ier Symposium International de Bactériologie Alimentaire, Lille, 1954, Bactériologie des Semi-Conserves de Viandes—Rapports, Communications et Discussions, *review* by Dr. M. Ingram, 6
Asterias forbesi : Role of the Terminal Pigment Spots of the Starfish, in Light Orientation (Prof. M. Rockstein), 341
Astin, Dr. A. V., and others : International Comparisons of Radioactivity Standards, 12
Astronomical Clockwork : Chinese (Dr. Joseph Needham, Wang Ling and Dr. Derek J. Price), 600
Astronomical Instruments : History of, *review* by Dr. H. E. Butler, 955
Astronomical Photoelectric Photometry (edited by Frank Bradshaw Wood), *review* by Dr. A. H. Jarrett, 814
Astronomical Society, Royal : Gold Medal awarded to Prof. T. G. Cowling, 119
  Geophysical Discussion on Movements in the Ionosphere, 307
  Election of Officers for 1956, 314
  Geophysical Discussion on Improvements in Seismic Prospecting, 1209
Astronomical Time : Atomic and (Dr. L. Essen and J. V. L. Parry), 744
Astronomical Union, International : Meeting at Ohio State University, 693
Astronomical Union, International (International Union of Theoretical and Applied Mechanics and the) : I.A.U. Symposium Series, No. 2, Gas Dynamics of Cosmic Clouds—a Symposium held at Cambridge, July 6–11, 1953 (edited by H. C. van de Hulst and J. M. Burgers), *review* by Dr. F. D. Kahn, 352
Astronomy : The Need for Observations in the Older Branches of, especially Double Stars (Dr. J. Jackson), 975
  New Methods in, *review* by Dr. J. S. Hey, 299
  Radio (Dr. J. L. Pawsey and Dr. R. N. Bracewell), *review* by Dr. J. S. Hey, 299
Astronomy in the Australian National University, 965
Asumnaa, S. : Electron Microscopy of Fibres, 319
Asundi, Prof. R. K., and Joshi, B. D. : The Near Ultra-Violet Bands of *para*-Dichlorobenzene, 36
Atherton, E. (Peters, Prof. R. H., and) : Recent Advances in the Chemistry of Colouring Matters, 646
Atkin, D. (Bowie, S. H. U., and) : An Unusually Radioactive Fossil Fish from Thurso, Scotland, 487
Atkins, Dr. D. : Ciliary Feeding Mechanisms of Brachiopods, 706
Atkins, Dr. W. R. G., and Jenkins, Pamela G. : Factors Affecting the Vernal Phytoplankton Outburst in the English Channel, 1218
Atkinson, Dr. R. d'E. : *Obituary* of Prof. W. M. H. Greaves, 209
Atkinson, Ralph H. : Retirement as head of the Platinum Metals Section of the Research Laboratory at Bayonne, New Jersey, of the International Nickel Company, 167
Atlantic (North) Treaty Organization (Aeromedical Panel of the Advisory Group for Aeronautical Research and Development) : Anthropometry and Human Engineering, a Symposium on Anthropometry, Human Engineering and Related Subjects on May 3–4, 1954, in Scheveningen, The Netherlands, *review* by Wing-Comdr F. Latham, 350
Atlantis Marine Geological Expedition to Peru and Chile (Dr. Parker D. Trask), 454
Atlas du Ciel (Vincent de Callatay), *review* by Prof. C. W. Allen, 957
Atmosphere : Turbulence in the (Royal Meteorological Society Symposium on), 13
Atmosphere (The Free), in the Vicinity of Fronts—Analysis of the Observations by the Meteorological Research Flight, 1950–52 (J. S. Sawyer), 656
Atmosphere (Lunar) : Density of the (Dr. E. J. Öpik), 123
Atmosphere (Upper) : Rocket Exploration of the (Dr. F. E. Jones and Prof. H. S. W. Massey), 643
Atmospheres (Stellar) : Physics of, *review* by Dr. Arthur Beer, 1191
Atmospheric Circulation : Antarctic (H. H. Lamb), 1076
Atmospheric Clouds : Physics of (F. H. Ludlam), 320
Atmospheric Dust and Temperature Inversions by Twilight Scattering : Detection of (Dr. E. K. Bigg), 77
Atmospheric Noise (Low-frequency), during the Cosmic-Radiation Storm of February 23 : Sudden Decrease in (C. A. McKerrow), 1223
Atmospherics (Whistling) : Observations of, at Geomagnetically Conjugate Points (M. G. Morgan and H. E. Dinger), 29 ; (M. G. Morgan and G. McK. Allcock), 30
Atolls (Coral) : Natural History of, 607
Atom Harvest (Leonard Bertin), *review* by S. C. Curran, 642
Atomes et Molécules par Études Radio-électriques : Colloque, 1022
Atomic Age : Genetic Problems of the, 103
  Perspectives and Problems (Science for Peace Public Conference on), 415
Atomic Energy : Minerals for (Robert D. Nininger), *review* by S. H. U. Bowie, 403
  Peaceful Uses of, 397
  Peaceful Uses of (Dr. T. E. Allibone), 1102
  Peaceful Uses of (Association of Scientific Workers and the Labour Research Department Pamphlet on), 69
  Peaceful Uses of—Proceedings of the International Conference held in Geneva, 1955 ; Vol. 2, Physics, Research Reactors ; Vol. 3, Power Reactors ; Vol. 14, General Aspects of the Use of Radioactive Isotopes, Dosimetry (United Nations), 1102
  Uranium for Peaceful Uses of, 461
Atomic Energy Authority (United Kingdom) : Staffing the, 16
  Two new Research Reactors, 165
  To withdraw from the Wairakei Heavy-Water Scheme, 213
  Opening of the Calder Hall Power Station, 1016
  Symposium on Controlled Thermonuclear Energy, 1016
Atomic Energy Authority (United Kingdom), and its Functions (Sir John Cockcroft), 204
Atomic Energy Commission (Australian) : Work of the (Prof. J. F. Baxter), 927
Atomic Energy Commission (United States) : Symposium on Genetic Recombination, given at the Research Conference for Biology and Medicine at Oak Ridge, Tennessee, April 1954, *review* by Prof. G. W. Beadle, 595
Atomic Energy Commission (United States), (prepared by the) : Research Reactors, *review* by Sir John Cockcroft, 593
  Neutron Cross-Sections, *review* by Dr. P. A. Egelstaff, 812
Atomic Energy Research Establishment : Conference on the Production and Utilization of Electromagnetically Enriched Isotopes, 157
  Course at the Isotope School on the Elements of Radiological Protection, 364
  New Out-Station for the, 508
  Open Days, 608
  Construction of LIDO, a research reactor of the 'swimming-pool' pattern, for the study of shielding problems, 777
  Specialized Course on the Design, Use and Maintenance of Electronic Instruments, 922
  The First Ten Years (Dr. A. H. S. Matterson), 1195
Atomic Scientists, Bulletin of the : Vol. 11, No. 9, Discussion on Genetic Problems of the Atomic Age, 103
Atomic Spectroscopy : Symposium at the Argonne National Laboratory (Dr. L. F. H. Bovey), 737
Atomic and Astronomical Time (Dr. L. Essen and J. V. L. Parry), 744
Atoms for Peace Awards, 777
Atoms, Electrons and Industry (Electronics Section of the Scientific Instrument Manufacturers' Association Exhibition on), 736
Attacks of Eyespot on Oats : Virulent (Prof. R. McKay, J. B. Loughnane and T. Kavanagh), 193
Attempted Colonization of Virginia : Raleigh's, *review* by Prof. Arthur Davies, 544
Attridge, John : A Gigantic *Holoptychius* from Dura Den, 232
Auca Indians (Dr. M. W. Stirling), 777
Audio Amplifiers : Transistor (Richard F. Shea), *review* by D. D. Jones, 864
Audio-frequency Electromagnetic Signals of Natural Origin : Low (R. E. Holzer and O. E. Deal), 536
Audio-Frequency Radio Waves : Propagation of, to Great Distances (Dr. F. W. Chapman and R. C. V. Macario), 930
Audus, Prof L. J. : Auxins and Plant Growth, *review*, 809
Auerbach, Dr. C., and Slizynski, Dr. B. M. : Sensitivity of the Mouse Testis to the Mutagenic Action of X-Rays, 376, 934
Auerbach, Dr. Robert : Effects of Single and Fractionated Doses of X-Rays on Mouse Embryos, 574
Auger, Prof. P : Documentation of Applied Chemistry, 168
Aulin-Erdtman, Mme. G. : Chemistry of Oxygenated Heterocyclic Compounds, 1117
Australia, a Camera Study (Frank Hurley), *review* by Sir Eric Ashby, 404
Australia : Beef-Cattle Industry of (W. A. Beattie), 1063
  New Methods of School Teaching in, *review*, 250
  The Place of Universities in, 1071
  Projected Giant Radio Telescope in, 607
Australia, Commonwealth of : Appointment of Dr. G. F. Humphrey as chief of the Division of Fisheries and Oceanography, Commonwealth Scientific and Industrial Research Organization, 461
  Bulletin No. 278 of the Commonwealth Scientific and Industrial Research Organization, The Beef-Cattle Industry of Australia (W. A. Beattie), 1063
  New members of the Advisory Council of the Commonwealth Scientific and Industrial Research Organization, 734
Australian Aboriginals : Absence of Abnormal Hæmoglobins in some (Dr. W. R. Horsfall and Dr. H Lehmann), 41
Australian Atomic Energy Commission : Work of the (Prof. J. F. Baxter), 927
Australian Earthworms (Elizabeth C. Pope), 875
Australian National University, Canberra : Appointment of Dr. K. J. LeCouteur to the chair of theoretical physics, 116
  Appointment of Dr. Bart J. Bok to the chair of astronomy, 965
Australian Tertiary Deposits : Pollen Grains of the *Ephedra* Type in (Dr. Isabel C. Cookson), 47
Australian Universities : The Place of the Australian University in the Community and Post-Graduate Studies in the (Australian Vice-Chancellors' Committee Symposium on), 1071
Australian University in the Community : The Place of the, and Post-Graduate Studies in the Australian Universities (Australian Vice-Chancellors' Committee Symposium on), 1071
Australian Vice-Chancellors' Committee : A Symposium on the Place of the Australian University in the Community and Post-Graduate Studies in the Australian Universities, 1071
Autolytic Enzyme of *Bacillus subtilis* : Action of an, on the Cell Wall (Masayasu Nomura and Junko Hosoda), 1037
Automatic Control in the Process Industries (Institution of Chemical Engineers and the Society of Instrument Technology Conference on), 252
Automatic Digital Computing Machines : Programme Design for (Mathematical Laboratory of the University of Cambridge Summer School in), 922
Automatic Feedback Control System Synthesis (Prof. John G. Truxal), *review* by Prof. A Tustin, 106
Automatic Recording of Temperature and Vapour Pressure or Dew-point (Dr. U. Berger-Landefeldt), 608
Automatic Regulation, *review* by R. Neumann, 766
Automation (Manchester Joint Research Council Meeting on), 1113
Automation, a Report on the Technical Trends and their Impact on Management and Labour (Department of Scientific and Industrial Research), 1141
Automation : Challenge of, *review* by E. F. L. Brech, 104
  International Congress on (Department of Mechanics of the Conservatoire National des Arts et Métiers, Paris), 1018
Automation and Management, 1141
Automobile Free-Piston Engines (F. D. Robinson), 914
Auto-oscillations in Extracted Muscle Fibre Systems (M. C. Goodall), 1238 ; (Dr. L. Lorand and C. Moos), 1239
Autoradiographer's Vade-Mecum, *review* by Prof. John E. Harris, 402
Autoradiographic Localization and Measurement of Intracellular Antibody, using Labelled Antigen (Dr. M. C. Berenbaum), 46

Autoradiography in Biology and Medicine (Prof. George A. Boyd), *review* by Prof. John E. Harris, 402
Autotrophic Bacteria : Biochemistry of (Dr. Howard Lees), *review* by Dr. Jane Meiklejohn, 809
Autumn Course in Nuclear Engineering (Queen Mary College, London), 653
Auxin . Chelating Agents as Plant Growth Substances—a Possible Clue to the Mode of Action of (Dr. O. V. S. Heath and Miss J. E Clark), 1118
Auxin Transport in Apple Shoots (F. G. Gregory and C. R. Hancock), 510
Auxins and Plant Growth (Prof. A. Carl Leopold), *review* by Prof. L. J. Audus, 809
Avco Manufacturing Corporation, New York : Appointment of Dr. Lloyd P. Smith as president of the Research and Advanced Development Division and vice-president of the Corporation, 968
Avian Schistosomiasis : Nasal Trichobilharziasis, a New (Dr. A. Fain), 389
Aviation Medicine : Collected Papers on (Presented at Aeronautical Panel Meetings of the Advisory Group for Aeronautical Research and Development, Paris), *review* by Wing-Comdr. F. Latham, 57
Avidity of the Tetracyclines for the Cations of Metals (Prof. Adrien Albert and C. W. Rees), 433
Avidity of the Water-soluble Components of Herbage for Added Cupric Ions (C. F. Mills and Grace Murray), 793
Avogadro Centenary Commemoration in Rome, 966
Awakening : The Technological (J. A Oriel), 873
Awards in Technology : Courses and, 920
Axon, P. E. (Daniel, E. D., and) : Absolute Measurements in Magnetic Recording, 519
Axons (Adrenergic) · Evidence for the Presence of Noradrenaline in Submicroscopic Structures of (Prof. U. S. von Euler and N.-Å. Hillarp), 44
Ayer, A. J., and others · Studies in Communication contributed to the Communication Research Centre, University College, London, *review* by Prof. G. Patrick Meredith, 446
Aylward, Dr. F : Phospholipids in Foods, 565
Aylward, Dr. F., and Wood, P. D S. · Urea Adducts of Glyceryl Esters, 146
Ayukawa, Hiroko, and others : The Blood Group Antigen *Diego* in North American Indians and in Japanese, 1084
8-Azaguanine ; Distribution of, in the Nucleic Acids of *Bacillus cereus* (Dr. R. E. F. Matthews and Dr. J. D. Smith), 271
Azulene : Structure of (Prof. J Monteath Robertson and Dr. H. M. M. Shearer), 885
Azzone, G. F., and others . Coupled Oxidation of Keto-Acids with Glutathione, 1232

BABA, Hiroaki, and others : Photoelectric Phenomena with Copper Phthalocyanine, 672
Babel, an International Journal of Translation, Vol. I, No. I, 313
Babel : Science (Dr. Knut Faegri), 343
Baboons (Depancreatized) · Nuclear Vacuolation in the Liver Cells of (Prof Joseph Gillman and Christine Gilbert), 656
Bacharach, A. L. . The Presentation of Science to the Public, 1066
Bacillus cereus . Distribution of 8-Azaguanine in the Nucleic Acids of (Dr. R. E F. Matthews and Dr. J D. Smith), 271
Bacillus megatherium : Nucleus and Spindle of, in Fission and Sporulation (Dr. Akira Yuasa), 386 ; (M. H. Jeynes), 849
Bacillus subtilis :- Action of an Autolytic Enzyme of, on the Cell Wall (Masayasu Nomura and Junko Hosoda), 1037
Back Grant for 1956 of the Royal Geographical Society awarded to Richard Hamilton, 606
Bacon, Dr. G. E. Semi- and Non-Crystalline Materials, 121
  Some Recent Developments in Magnetism, 518
Bacon, Dr. J. S. D. · Appointed head of the Department of Biochemistry at the Macaulay Institute for Soil Research, Aberdeen, 693
Bacteria . Assimilation of Berberine by (Prof. P. H. H. Gray and R. A. Lachance), 1182
  The Cytology and Life-History of (Dr. K A. Bisset), second edition, *review* by Dr. C. S. Cummins, 1007
  An Unidentified Amino-sugar present in Cell Walls and Spores of various (R. E. Strange and F. A. Dark), 186
Bacteria isolated from Human Fæces . Synthesis of Long-Chain Fats by (Dr. H. G. Sammons, D. J. Vaughan and A. C. Frazer), 237
Bacteria (Autotrophic) : Biochemistry of (Dr. Howard Lees), *review* by Dr. Jane Meiklejohn, 809
Bacterial Degradation of Heparin (A. Nail Payza and Edward D. Korn), 88
Bacterial Degradation of Nicotinic Acid (Isaac Harary), 328
Bacterial Extracts (Cell-free) . Oxidation of Octanoic Acid by (S. Dagley), 1131
Bacterial Pigments : Staining of Wool by (I E. B. Fraser and A. P. Mulcock), 628
Bacterial Variation to Sensitivity, an Example of Individuality in Micro-organisms (Dr. W. Howard Hughes), 1132
Bacterial and Brain Extracts : Anaerobic Deamination of D-Glucosamine by (Dr. P. Faulkner and Prof J H Quastel), 1216
Bactériologie des Semi-Conserves de Viandes (I^{er} Symposium International de Bactériologie Alimentaire, organisé par la Section de Microbiologie des Produits Alimentaires de l'Association Internationale des Sociétés de Microbiologie, Lille, 1954), Rapports, Communications et Discussions, *review* by Dr M. Ingram, 6
Bactériologie Alimentaire : I^{er} Symposium International de (organisé par la Section de Microbiologie des Produits Alimentaires de l'Association Internationale des Sociétés de Microbiologie, Lille, 1954), Bactériologie des Semi-Conserves de Viandes—Rapports, Communications et Discussions, *review* by Dr. M. Ingram, 6

Burton, Dr. Maurice : The Presentation of Science to the Public, 1066
Burton, Dr. W. K. : Theoretical Physics, 268
Bush, Dr. Vannevar : Report of the President of the Carnegie Institution of Washington for the Year ending June 30, 1955, 951
Bushy Stunt Virus : Structure of (D. L. D. Caspar), 475
Businger, J. A. (Kok, Dr. B., and) : Kinetics of Photosynthesis and Photo-Inhibition, 135
Busk (Edward) Memorial Prize of the Royal Aeronautical Society awarded to L. E. Fraenkel, 919
Busnel, René-Guy : Colloque sur l'Acoustique des Orthoptères, Jouy-en-Josas, 5–8 Avril 1954 (Annales de l'Institut National de la Recherche Agronomique, Série C, Annales des Épiphyties), *review* by Dr. P. T. Haskell, 403
Busvine, Dr. J. R. : Resistance of Insects to Insecticides, 356
  Normal Resistance-levels of *Anopheles gambiae* to various Insecticides, 533
Butcher, B. R. : Mechanism of Phase Transformations in Metals, 420
Butcher, Devereux : Seeing America's Wild-life in our National Refuges, *review* by E. M. Nicholson, 765
Butler, Dr. Colin G. (Carlisle, Dr. David B., and) : The 'Queen-Substance' of Honeybees and the Ovary-inhibiting Hormone of Crustaceans, 276
Butler, E. J. : Appointed principal research officer, Northern Region, Nigeria, 736
Butler, Dr. G. C. : Metabolism and Function of Phospholipids, 22
Butler, Dr. H. E. : History of Astronomical Instruments, *review*, 955
Butler, Prof. J. A. V. : Advances in Protein Chemistry, *review*, 295
  The Structural Chemistry of Proteins, *review*, 404
  Elected a Fellow of the Royal Society, 558
Butler, Prof. J. A. V., and Randall, Prof. J. T. (edited by) : Progress in Biophysics and Biophysical Chemistry, Vol. 5, *review* by Prof. F. G. Young, 447
Butler, Prof. J. A. V. (Shooter, Dr. K. V., and) : Fractionation of Deoxyribonucleic Acid by Physical Procedures, 1033

Butler, O. I. : Title of reader in electrical machinery in the University of Sheffield conferred on, 1017
Buu-Hoï, N. P. : Chemistry of Oxygenated Heterocyclic Compounds, 1116
Buxton, Prof. P. A. : *Obituary* by Prof. P. C. C Garnham, 67
Buzzell, Anne, and others : Mechanism of Inactivation of Tobacco Mosaic Virus by X-rays, 890
Byrt, Mabel E. : Call of the River, *review* by F. P., 814

CADMIUM : Dependence of the Elastic-Properties of, on Temperature (S. V. Subrahmanyam), 852
Cadmium Salts : Effect of, on Testicular Tissue (J. Parízek and Z. Záhor), 1036 ; (J. Parizek), 1036
Cahn, Dr. R. S. : Documentation of Applied Chemistry, 169
Cahn, Dr. R. W. : Mechanism of Phase Transformations in Metals, 419
Caine, Sir Sydney : Appointed director of the London School of Economics and Political Science, 689 ; work of, 689
Cairns, H. J. F., and Watson, G. S : Multiplicity Reactivation of Bacteriophage, 131
Calcium Superoxide : Formation of (Prof. Cyrill Brosset and Nils-Gösta Vannerberg), 238
Calculable Standards of Capacitance : A New Theorem in Electrostatics and its Application to (A. M. Thompson and Dr. D. G. Lampard), 888
Calculus of Finite Differences : An Introduction to the (Prof. C. H. Richardson), *review*, 680
Calculus (Operational), based on the Two-sided Laplace Integral (Dr. Balth van der Pol and Dr H. Bremmer), second edition, *review* by Prof. L. M. Milne-Thomson, 954
Calder, Ritchie : Science makes Sense, *review* by R. Brightman, 955
Calder, W. V : Appointed assistant conservator of forests, Uganda, 1112
Calder Hall Pile, 1016
Caley, Earle R : Chemical Composition of Parthian Coins, 23
Call of the River (Mabel E. Byrt), *review* by F P., 814
Callaghan, Dr. A. R. : Appointed a member of the Advisory Council of the Commonwealth Scientific and Industrial Research Organization, 734
Calvin, Prof. M. : Chemistry, Biochemistry and Pharmacology of Thioctic Acid, 75
Camargue : Death of Flamingoes in the (John Hillaby), 1247
Cameron, Margaret P. (edited by Wolstenholme, G. E. W., and) : Experimental Tuberculosis—Bacillus and Host, with an Addendum on Leprosy, *review* by Dr. Derek Hobson, 448
Campbell, Dr. J. G. : Elected a Fellow of the Royal Society of Edinburgh, 506
Campbell, Dr. P. N., and others : Plasma Protein as a Precursor of Rat Liver and Hepatoma Protein, 138
Canada : Scientific and Technical Societies of the United States and (National Academy of Sciences—National Research Council), sixth edition, *review*, 549
Canadian Association of Physicists : Eleventh Annual Physics Congress, 1018
Canadian High Polymer Forum : Seventh (National Research Council of Canada and the Chemical Institute of Canada), 1208
Cancer : Antimetabolites and (edited by Cornelius P. Rhoads), *review* by G. M. Timmis, 1007
Cancerologie : New French Journal of Cancer Research (Anti-Cancer Centre, Lille), 413
Cannell, J. S (Alcock, Margaret, and) : Temperature Effects in the Paper Partition Chromatography of Sugars, 327
Capacitance : A New Theorem in Electrostatics and its Application to Calculable Standards of (A. M. Thompson and Dr D. G. Lampard), 888
Capacity Measurements for the Study of Oxide Films on Metals : Use of (J. N. Wanklyn), 849
Capillary Feeding in *Aedes aegypti* (L.) : Observations on Pool and (Prof. Fergus J. O'Rourke), 1087
Caplan, H : Awarded the Pilcher Memorial Prize of the Royal Aeronautical Society, 919
Capper Pass Awards for Papers on Metallurgy (Institution of Mining and Metallurgy and the Institute of Metals), 68, 363
Capstick, C. K. : Lactophenol Preparations for Soil Nematodes, 896
Carbohydrases in Blow-fly Larvæ (W. A. L. Evans and J. Marsden), 478
Carbohydrate Metabolism : Glucagon and the Regulation of (Dr. H. Elrick), 892
Carbon : Homogeneous and Heterogeneous Graphitization of (Dr. Rosalind E. Franklin), 239
Carbon-14 : Incorporation of, into the Complex Polysaccharides of Plants (Dr. L. Hough and Dr. J. B. Pridham), 1039
Carbon Compounds : Chemistry of (edited by Dr. E. H. Rodd), Vol. 3, Part A, Aromatic Compounds, *review* by Prof. R. A. Raphael, 1101
Carbon Dioxide : Effect of, on the Manganese Absorption of Red Beet Tissue (A. D Skelding), 1038
Carbon Dioxide at —79° C. : Adsorption of, on High-Silica Sands (H. D. Segrove), 987
Carboniferous Rocks of Great Britain : Fossil Plants of the (Dr. Robert Crookall), (Memoirs of the Geological Survey of Great Britain, Palæontology, Vol. 4, Part 1), *review* by Prof J. Walton, 152
Carboxyl Carbon of L-Phenylalanine : Utilization of the, for the Synthesis of the Amino-acids of Silk by *Bombyx mori* (S. Bricteux-Grégoire, W. G. Verly and Prof. M. Florkin), 1237
Carboxylic Acid (Pyrrolidone) : Enzymic Formation of, from γ-Glutamyl Peptides (George E. Connell and Prof. Charles S. Hanes), 377
Carcinogen produced by Endogenous Metabolism : 3-Hydroxyanthranilic Acid, a (Prof. E. Boyland and G. Watson), 837
Carcinogenic Hydrocarbons from Cigarette Smoke : Assay of Possible (M. J Lyons), 630
Carcinoma Cells (Ehrlich Ascites) : Immunological Studies with Protein Fractions isolated from (Dr. John S. Colter, Hilary Koprowski, Harris H. Bird and Kathryn Pfeister), 994
Cardiac Glycosides : A Method for Determining the Duration of Action of the (M. Rand and Anne Stafford), 278
Cardiazol Shock : Effect of Electric Shock and, on Morphine Tolerance (Y. Kasé), 1136
Careers for Graduates (edited by the University of London Appointments Board), *review* by T. H. Hawkins, 308
Carioazulene, Natural and Synthetic, derived from Caryophillene (Dr. N. Botafogo Gonsalves, M. A. Reis Cavalcanti and Djalma Paiva), 145
Carlbom, L., and others : Enrichment of Heavy Water by a Biological Method, 988
Carlisle, Dr. David B., and Butler, Dr. Colin G. : The 'Queen-Substance' of Honeybees and the Ovary-inhibiting Hormone of Crustaceans, 276
Carlson, Thomas A., and others : Cation-Exchange Properties of Zirconium (IV)—Tungsten (VI) Precipitates, 1128
Carne, Prof. H. R : Appointed a member of the Advisory Council of the Commonwealth Scientific and Industrial Research Organization, 734
Carnegie Institution of Washington : Publication No. 607, Studies of Biosynthesis in *Escherichia coli* (Richard R. Roberts, Philip H. Abelson, Dean B. Cowie, Ellis T. Bolton and Roy J. Britten), *review* by Dr. Kenneth McQuillen, 594
  Report of the President for the Year ending June 30, 1955, 951
Carnegie Trust for the Universities of Scotland : Fifty-fourth Annual Report (1954–55), 739
Carnegie United Kingdom Trust : Forty-second Annual Report (1955), 1026
Carotid Body of the Pilot Whale, *Globicephala melaena* (L. L. de Kock), 1084
Carpenter, Stanley J., and La Casse, Walter J. : Mosquitoes of North America (North of Mexico), *review*, 56
Carr, Prof. Archie : Awarded the Elliot Medal of the National Academy of Sciences, Washington, 924 ; work of, 925
Carr-Saunders, Sir Alexander : Retirement from the directorship of the London School of Economics and Political Science, 689 ; work of, 689
Carruthers, Dr J. N. : *Obituary* of D. J. Matthews, 410
Carstairs, Dr. G. M. : Social Analysis of Life in a Mental Hospital, *review*, 250
Carter, Dr. H. E. : Chemistry of Phospholipids, 21
Carter, Dr. T. C. : Elected a Fellow of the Royal Society of Edinburgh, 505
Cartilage (Rachitic Rat) : Effect of Vitamin D on the Phosphorus Content of (J. G. Joshi and P E. Dikshit), 625
Cartledge, Dr. G. H. : Electrochemistry of Stainless Steel in Sulphuric Acid, 181
Cartwright, D. E. : Statistics and Aerodynamics of the Sea Surface, 62
Cartz, Dr. L. : Semi- and Non-Crystalline Materials, 121
Cartz, Dr L., and others : New X-Ray Data on Coals, 500
Caryophillene : Carioazulene, Natural and Synthetic, derived from (Dr. N. Botafogo Gonsalves, M. A. Reis Cavalcanti and Djalma Paiva), 145
Casein : Orotic Acid as a Survival Factor in Rats Deficient in the Animal Protein Factors of (A. Rabbi, M. Marchetti, R. Viviani and Prof. G. Moruzzi), 757
Caspar, Dr. D. L D. : Structure of Small Viruses—Structure of Bushy Stunt Virus, 475
  Structure of Tobacco Mosaic Virus—Radical Density Distribution in the Tobacco Mosaic Virus Particle, 928
Cass, W. G. : Recent Soviet Research on Microbiology in the Arctic and other Regions, 654
Cassia : Polyembryony in (D. E. Symon), 191
Castaing, R. : Mechanism of Phase Transformations in Metals, 419
Casuarina : A Feature of the Root Nodules of (Dr. G. Bond), 191
Cat : Secretory Potentials and Secretion in the Sublingual Gland of the (Dr. Anders Lundberg), 1080
Catalase : Role of Ergothioneine and, in Infection by Ergot Fungus (*Claviceps purpurea* Tul), (A. St. Garay), 91
Catalase in Tyrosine Metabolism : A Requirement for—the Oxidation of *p*-Hydroxyphenylpyruvic Acid to Homogentisic Acid (Dr. Bert N. La Du and Vincent G. Zannoni), 574
Catalysis (edited by Paul H Emmett), Vol. 3, Hydrogenation and Dehydrogenation, *review* by Dr. E. B. Maxted, 765
Catalysis (Metal Ion), and Polarity of Environment in the Aerobic Oxidation of Unsaturated Fatty Acids (Dr. N. Uri), 1177
Catalytic Hydrogenation, *review* by Dr. E. B. Maxted, 765
Cathodic Sputtering : A New Apparatus for (L. Holland), 1229
Cation-Exchange Properties of Zirconium (IV)—Tungsten (VI) Precipitates (Kurt A. Kraus, Thomas A. Carlson and James S. Johnson), 1128
Cations on Anion Exchange Resins : Adsorption of Trace Amounts of, by the Formation of Insoluble Salts (R. H. James and G. A. Welch), 183
Cations of Metals : Avidity of the Tetracyclines for the (Prof. Adrien Albert and C. W. Rees), 433
Cations (Sea Water), across the Ectoderm of *Fundulus heteroclitus* : Factors influencing the Transport of (D. R. Shanklin), 431
Cattle : Adrenergic Sweating in (G. C. Taneja), 482
  Dairy (Prof. William Wodin Yapp and Prof. William Barbour Nevens), fourth edition, *review* by Arthur S. Foot, 55
  A Simple Method of Assessing the Moisture exuded through the Skin of (R. M. Mabon), 28–
Cattle (Beef) : Muscular Dystrophy of, and Unsaturated Fats (Dr. G. A. Garton, W. R. H. Duncan, K. L. Blaxter, R. F. McGill, G. A. M. Sharman and M. K. Hutcheson), 792, *erratum*, 1208
Cattle (Beef-) Industry of Australia (W. A. Beattie), 1063
Cattle (Friesian) : Effects of Climate on Body Temperature and Respiration-rate of Buffaloes and (Dr. K. A. Alim and I. A. Ahmed), 900
Cavalcanti, M. A. Reis, and others : Carioazulene, Natural and Synthetic, derived from Caryophillene, 145
Cavallini, D., and others : Coupled Oxidation of Keto-Acids with Glutathione, 1232
Cavell, A. C. : The Teaching of Chemical Principles in School and University, 73
Cawderry-Hope, M. J. : Appointed scientific officer, East African Tsetse and Trypanosomiasis Research and Reclamation Organization, 70
Cawsey, G. F. (Farrands, Dr. John L., and) : Microwave Observation of Detonation, 34
Cell (Plant Host) : Sporulation of Fungi inside the (Hussein M. Elarosi), 665
Cell Fragments : Chromatography and Partition of Cells and (Per-Åke Albertsson), 771
Cell Monolayer on Glass : Growth of Bovine Amniotic Ectoderm as a, and its Use as a System for Virus Multiplication (T. W. F. Pay), 752
Cell Secretion : Proceedings of a Symposium on (edited by G. Schreiber), 831
Cell Suspensions from Rat Livers : Preparation of (Dr. I. S. Longmuir and Mrs. Wendy ap Rees), 997
Cell Wall : Action of an Autolytic Enzyme of *Bacillus subtilis* on the (Masayasu Nomura and Junko Hosoda), 1037

Cell Wall of *Chlorella vulgaris* : An Electron Microscopical Study of the Histochemical Localization of Alkaline Phosphatase in the (Dr. D. Brandes and Dr. R. N. Elston), 274
Cell Walls and Spores of various Bacteria · An Unidentified Amino-sugar present in (R. E. Strange and F. A. Dark), 186
Cell (Red) Production : Plasma Factor(s) influencing (L. O. Jacobson, L. Plzak, W. Fried and E. Goldwasser), 1240
Cell (Red-) Survival in Familial Hæmolytic Anæmias (Robert L. Evans), 839
Cell-free Bacterial Extracts : Oxidation of Octanoic Acid by (S. Dagley), 1131
Cells : X-Ray Mass Determination in, by Scanning (Bengt O. H. Rosengren), 1127
Cells (Animal and Plant) : Cultivation of (Dr. Philip R. White), *review* by Prof. R. J. Gautheret, 719
Cells (Ehrlich Ascites Carcinoma) : Immunological Studies with Protein Fractions isolated from (Dr. John S. Colter, Hilary Koprowski, Harris H. Bird and Kathryn Pfeister), 994
Cells (Hepatic), of the Fœtal Sheep : Nuclear and Cytoplasmic Volumes in the (D. A T. Dick), 236
Cells (Individual Nerve) Quantitative Determination of Acetylcholinesterase Activity in (Dr. Ezio Giacobini and Dr. Joseph Zajicek), 185
Cells (Liver), of Depancreatized Baboons . Nuclear Vacuolation in the (Prof. Joseph Gillman and Christine Gilbert), 656
Cells (Normal and Homologous Tumour) : Differences between the Electrical Charge carried by (Dr. E. J. Ambrose, A. M. James and J. H. B. Lowick), 576
Cells (Plant) · A Stimulatory Action of Indole-3-Acetic Acid on the Uptake of Amino-Acids by (Leonora Reinhold and R. G Powell), 658
Cells (Yeast) . Regeneration of, from Naked Protoplasts (O. Nečas), 898
Cells and Cell Fragments : Chromatography and Partition of (Per-Åke Albertsson), 771
Cellulose : The Chemistry of, *review* by Prof. E. L. Hirst, 677
Cellulose and Cellulose Derivatives (edited by Emil Ott, Harold M. Spurlin and Mildred W. Grafflin), second edition, *review* by Prof. E. L. Hirst, 677
Cellulose Derivatives : Cellulose and (edited by Emil Ott, Harold M. Spurlin and Mildred W. Grafflin), second edition, *review* by Prof. E. L. Hirst, 677
Cements, including Glasses, Slags and Foundry Sands : Microscopy of Ceramics and (Herbert Insley and Prof. Van Derek Fréchette), *review* by Dr. W. Campbell Smith, 640
Centenaries in 1956 : Scientific (Joan M. Eyles), 7
Centenary of the Discovery of Mauveine by W. H. Perkin (Exhibition at the Huddersfield Technical College by the Huddersfield Section of the Society of Dyers and Colourists to commemorate the), 464
Centenary of *The Engineer* (W J. Priest), 10
Centenary of the Geological Survey in Scotland (Dr. A. G. MacGregor), 216
Centenary of 'The Laws of Thought' by George Boole : Celebration of the (Proceedings of the Royal Irish Academy, Vol. 57, Section A, No. 6), 554
Centenary of the former Scottish Meteorological Society, 371
Centimetre Wave-lengths : A Film Radiometer for (J. A Lane), 392
  Spectroscopy at, *review* by Dr. D M. S Bagguley, 1099
Central Nervous System : Biochemistry and the (Prof. Henry McIlwain), *review* by Dr. G. B. Ansell, 720
Central Nervous System of the Frog : Pseudo-Cholinesterase in the (D. C. Hardwick and Dr. Catherine Hebb), 667
Central Office of Information (Meteorological Office and the) : Your Weather Service, revised edition, 1158
Centre International d'Epistémologie génétique: Establishment of the, 829
Centre National de la Recherche Scientifique : Scholarships to British workers in Medical Science, 415
Cepea nemoralis L. : Influence of Temperature on the Histological Evolution of the Ovotestis of (J. Bouillon), 142
Cephalopoda : Ink Ejection by (D. N. F. Hall), 663
Ceramics and Cements, including Glasses, Slags and Foundry Sands : Microscopy of (Herbert Insley and Prof. Van Derek Fréchette), *review* by Dr. W. Campbell Smith, 640
Cereals Recent Advances in the Chemistry and Industrial Applications of (Royal Institute of Chemistry Symposium on), 1018
Cerebral Blood-flow : A Direct Method for the Measurement of (D. H. Ingvar and U. Soderberg), 339
Cerebral Tissue Extracts : Spasmolytic Effect of (Dr. O. C. Forbes), 893
Cerebrum (Cockroach) : Electrical Activity in the (Donald M. Maynard), 529
Cervus elaphus : Differences in Proportion of Fawns to Hinds in Red Deer, from several New Zealand Environments (Thane Riney), 488
Chadwick, Sir James : *Obituary* of Mme. Irène Joliot-Curie, 964
Chain, Prof. E. B. : Order of the Grande Ufficiale al Merito della Repubblica bestowed on, by the Italian Foreign Minister, 1156
'Chain Effect', a Possible Analogue of Enzyme Action (Dr. D. G. H. Ballard and Dr. C. H. Bamford), 477
Chain Reaction : Irradiation of Thiourea—Effect of Dose-rate upon the (Dr. W. M. Dale), 531
Chains in Vinyl Polymerization : Termination of, by Metal Salts (Dr. E. Collinson and Prof. F. S. Dainton), 1224
Challenge of Automation, *review* by E. F. L. Brech, 104
Challenger Society : Grants for Research in Marine Biology or Oceanography, 1018
Challenger Society (Royal Meteorological Society and the) : Symposium on Statistics and Aerodynamics of the Sea Surface, 62
Chamberlain, Prof. O., and others : Antiprotons, 11
Chambers, E. G. : Psychological Tests for Accident Proneness and Industrial Proficiency (Medical Research Council, Memorandum No 31), 313
Chance, Dr. M. R. A. : Environmental Factors influencing Gonadotrophin Assay in the Rat, 228
Chance, Dr. M. R A , and others : Changes in the Dimensions of the Nuclei of Neurones with Activity, 1081
Chandler, Prof. Asa C. : Introduction to Parasitology, with Special Reference to the Parasites of Man, ninth edition, *review* by Dr. G. Lapage, 55
Chandler, Marjorie E J. · Schizaeaceae of the South of England in Early Tertiary Times, 463
Chandos, Rt. Hon. Viscount : Awarded honorary membership of the Institution of Mining and Metallurgy, 966
Chandra (Acharya Jagadish) Memorial Lecture (Dr. Sunder Lal Hora), 781
Chandrasekharan, Prof. K. : Presidential Address to the International Conference on Mathematical Education in South Asia, 694
Change of Hardness in Steel due to Hydrogen (H. G. Vaughan and M. E. de Morton), 1225
Changes with Age . Connective Tissue and its (British Society for Research on Ageing Conference on), 467
Changes in the Dimensions of the Nuclei of Neurones with Activity (Dr. M. R. A. Chance, A. J. Lucas and Dr. J. A. H. Waterhouse), 1081
Changes in Lattice Constant of Cr_2O_3 near the Curie Temperature (Selma Greenwald), 286
Changes (Reversible, Host-induced), in a Strain of Tobacco Mosaic Virus (F. C. Bawden), 302
Chantrenne, Prof H. : Incorporation of Adenine and Uracil into Ribonucleic Acid during Enzyme Induction in Resting Yeast, 579
Chaplin, T. K. · Appointed lecturer in civil engineering at the University of Birmingham, 876
Chapman, Dr. F. W., and Macario, R. C. V. : Propagation of Audio-Frequency Radio Waves to Great Distances, 930
Chapman, Dr J. A. : Electron Microscopy of Fibres, 318
Chapman, Dr. John A. · Flight-muscle Changes during Adult Life in a Scolytid Beetle, 1183
Chapman, Dr. Norman B. . Appointed to the G. F. Grant chair of chemistry in the University of Hull, 1203 , work of, 1203
Chapman, Prof. Sydney : Honorary Fellowship of the Imperial College of Science and Technology conferred on, 733
Chaptal, J. A. C., Comte de Chanteloup (1756–1832), 1015
Characteristics of the Cyclotron Beam : Improving the (W. B. Powell), 1045
Characterization of an Enzyme reducing Pyrroline-5-Carboxylate to Proline (Marion E Smith and Prof. David M. Greenberg), 1130
Chargaff, Prof Erwin, and others : Inhibition of Influenza Virus Hæmagglutination by a Brain Lipid Fraction, 234
Charles, A. O T. : Electron Microscopy of Fibres, 319
Charles, G. W. : Spectroscopy, 738
Charlot, Prof. G. : Qualitative Inorganic Analysis (translated from the fourth French edition by Dr. R. C. Murray). *review* by Prof. J. R. Partington, 498
Charnock, H. : Turbulence in the Atmosphere and in the Ocean, 13
  Statistics and Aerodynamics of the Sea Surface, 62
Chart, J. J. · The Neurohypophysis, 1020
Chatt, Dr. J , and others . Electronic Structures of Dithiocarbamates and Xanthates, 1042
Chatt, Dr. J , and Venanzi, L M. : Olefin Complexes of Rhodium, 852
Chaudhri, Prof. Rafi M , and others · Emission of Photo Radiations by the Impact of Positive Ions of Helium on Nickel, 1226
Chaudron, Prof. G L. : Awarded the Platinum Medal (1956) of the Institute of Metals, 16
Chavan, Prof. V. M. : Elected president for 1956 of the Indian Society of Genetics and Plant Breeding, 214
Chayen, Dr. J., and others : Variations in the Amount of Feulgen Stain in Nuclei of Plants Grown at Different Temperatures, 272
Chelating Agents · Infra-Red Spectra of—2-Phenacylpyridine Derivatives (R. F. Branch), 671
Chelating Agents as Plant Growth Substances—a Possible Clue to the Mode of Action of Auxin (Dr. O. V. S. Heath and Miss J. E. Clark), 1118
Chemical Analysis : Colorimetric Methods in, *review* by J. King, 201
Chemical Background of the Aluminium Industry (Dr. T. G. Pearson), 462
Chemical Composition of Parthian Coins (Earle R. Caley), 23
Chemical Engineering : The Principles of Chemical Equilibrium, with Applications in Chemistry and (Prof. Kenneth Denbigh), *review*, 1145
Chemical Engineering at Manchester, 460
Chemical Engineering in the Coal Industry (National Coal Board International Conference on), 1018
Chemical Engineering, British, No. 1, 874
Chemical Engineers : Thermodynamics for Chemists and, *review*, 1145
Chemical Engineers, Institution of : Symposium and Exhibition on Modern Techniques in Chemical Plant Construction, 415
Chemical Engineers, Institution of, and the Society of Instrument Technology : Conference on Automatic Control in the Process Industries, 252
Chemical Equilibrium : The Principles of, with Applications in Chemistry and Chemical Engineering (Prof. Kenneth Denbigh), *review*, 1145
Chemical Industry: Infra-Red Spectroscopy and (Dr. H. W. Thompson), 915
Chemical Industry, Society of : Symposium on Applications of Infra-Red Spectroscopy, 415
  Conference on the Disposal of Industrial Waste Materials, 562
  Seventy-fifth Annual Meeting, 609, 876
  Series of lectures on Achievements of Industrial Chemistry, 609
  Fourth list of amendments to the third edition of the World List of Scientific Publications, 1159
Chemical Industry, Society of (Corrosion Group and the Birmingham and Midland Section) : Symposium on Corrosion Prevention in Packaging and Storage, 511
Chemical Industry, Society of (Education Panel of the Corrosion Group) : Prize for an essay or paper on the Corrosion of Metals and its Prevention, 17
Chemical Industry, Society of (Fine Chemicals Group) : Debate on the Motion 'That Science can Provide as Good an Education as the Humanities', 562, 960
Chemical Industry, Society of (Food Group and the Oils and Fats Group) : Conference on Phospholipids in Foods, 119, 565
Chemical Industry, Society of (Nutrition Panel of the Food Group) : Discussion on Nutritional Requirements and Food Fortification—Iodine and Fluorine, 562, 912
Chemical Industry, Society of (Plastics and Polymer Group) . Symposium on Epoxide Resins, their Chemistry and Structure in relation to their Properties and Applications, 962
Chemical Industry, Society of (Association of Applied Biologists and the) : Symposium on the Resistance of Insects to Insecticides, 355
Chemical Industry, Society of, and others : Perkin Centenary Celebrations, 1009
Chemical Institute of Canada (Biochemistry Division) : Symposium on Phospholipids, 20

Chemical Institute of Canada (National Research Council of Canada and the): Seventh Canadian High Polymer Forum, 1208
Chemical Manufacturers (British), Association of, and others Perkin Centenary Celebrations, 1009
Chemical Nature of Nucleic Acids in Cyanophyceae (B. B. Biswas), 95
Chemical Nomenclature The Prefix 'Nor' in (Dr. A. M. Woolman), 1046 ; (Prof. J. H Gaddum), 1046
Chemical Periodicity : Mathematical (Dr. L. M. Marson), 1179
Chemical Plant Construction Modern Techniques in (Institution of Chemical Engineers Symposium and Exhibition on), 415
Chemical Principles . Rational Approach to (Dr. John A. Cranston), second edition, *review* by J. A V. B., 597
Chemical Principles in School and University : The Teaching of (British Association for the Advancement of Science, Sections B (Chemistry) and L (Education), Discussion on), 72
Chemical Research : Ramsay Memorial Fellowships for, 653
Chemical Society : Symposium on Recent Advances in the Chemistry of Colouring Matters, 69, 645
  Symposium on Antibiotics and Mould Metabolites, 562, 1058
  Election of Officers, 693
  Symposium on Chemisorption, 1113
Chemical Society, and others : Perkin Centenary Celebrations, 1009
Chemical Technology . Encyclopedia of (edited by Raymond E Kirk and Donald F. Othmer), Vol. 11, Polyols to Rutin ; Vol 12, Sabadine to Stilbestrol , Vol. 13, Stilbite to Thermochemistry ; Vol. 14, Thermodynamics to Waterproofing, *review* by Sir Alfred Egerton, 861
Chemicals : The Analysis of Drugs and (Dr. Norman Evers and Wilfred Smith), *review* by J. R. Nicholls, 597
Chemicals ('Solubilized'), for the Control of Plant Nematodes (L. N. Staniland), 97
Chemicals and Standards : Reagent, with Methods of Testing and Assaying Them (Joseph Rosin), third edition, *review*, 550
Chemie (anorganischen) : Lehrbuch der (begrundet von A. F. Holleman), 34–36 Auflage, bearbeitet von Prof. Egon Wiberg, *review*, 641
Chemisorption (Chemical Society Symposium on), 1113
Chemist : Mathematics for the (Prof. G. J. Kynch), *review*, 678
Chemist (Organic) : Physics for the, *review* by Dr. W. A. Waters, 721
Chemistry (Science Masters' Book, Series 3, Part 2, arranged and edited by G Fowles, with the assistance of E. H. Coulson and Charles Holt), *review* by J C Stredder, 957
  College (Prof. Linus Pauling), second edition, *review*, 597
  Dyestuffs, *review* by Dr. S Coffey, 498
  Experimental Inorganic (Dr. W. G. Palmer), *review*, 499
  Macromolecular (Commission on Macromolecules of the International Union of Pure and Applied Science Symposium on), (Polymers, Biocolloids and Polyelectrolytes in Solution), 562, 1161
  Organic (Dr. I. L. Finar), second edition, *review* by G. F , 1101
  Organic (Prof. Lewis F. Hatch), *review* by G. Fowles, 1194
  Practical Physical (Prof. Alexander Findlay), revised and edited by Dr. J. A. Kitchener, eighth edition, *review*, 203
  An Introduction to the Principles of (Prof. L. H. Cragg and Prof. R. P. Graham), *review*, 597
Chemistry at Birmingham, 1156
Chemistry at Hull, 1203
Chemistry at Rothamsted Experimental Station, 559
Chemistry, Royal Institute of Lectures, No. 5, Chemistry and Crop Nutrition (Sir William Ogg), 208
  Monograph No. 3, The Chemical Background of the Aluminium Industry (Dr. T. G. Pearson), 462
  Symposium on Recent Advances in the Chemistry and Industrial Applications of Cereals, 1018
Chemistry, Royal Institute of, and others : Symposium on the Presentation of Science to the Public, 415, 1066
  Perkin Centenary Celebrations, 1009
Chemistry or allied technical subject : Scholarships for the study of (Shell Austria, A.G.), 779
Chemistry of Carbon Compounds (edited by Dr. E. H. Rodd), Vol. 3, Part A, Aromatic Compounds, *review* by Prof. R. A. Raphael, 1101
Chemistry of Cellulose, *review* by Prof. E L. Hirst, 677
Chemistry of Colouring Matters : Recent Advances in the (Chemical Society Symposum on), 69, 645
Chemistry of Lipids of Biochemical Significance (Dr J. A Lovern), *review* by Prof. A. C. Frazer, 1050
Chemistry of Our Times (Elbert C. Weaver and Laurence S. Foster), second edition, *review* by G. Fowles, 767
Chemistry of Oxygenated Heterocyclic Compounds—International Colloquium at Lyons, 1116
Chemistry of Synthetic Dyes and Pigments (edited by H. A. Lubs), *review* by Dr. S. Coffey, 498
Chemistry (Analytical), Society for : Eighty-second Annual General Meeting, 651
  Election of Officers, 651
  Bernard Dyer Memorial Lecture (Sir William Slater), 651
Chemistry (Applied) : First International Congress on Documentation of (International Union of Pure and Applied Chemistry), 168
Chemistry (Biophysical) : Progress in Biophysics and (edited by Prof. J. A. V. Butler and Prof. J. T. Randall), Vol. 5, *review* by Prof. F. G. Young, 447
Chemistry (Industrial) : Achievements of (Series of lectures in connexion with the seventy-fifth Annual Meeting of the Society of Chemical Industry), 609
Chemistry (Macromolecular) : International Symposium on (Commission on Macromolecules of the International Union of Pure and Applied Chemistry and the Weizmann Institute of Science), (Polymers, Biocolloids and Polyelectrolytes in Solution), 562, 1161
Chemistry (Organic) : Ciba Research Scholarship in the Techniques of (University of Birmingham), 693
  The Development of, since Perkin's Discovery (Sir Alexander Todd), 1009
  Technique of (edited by Arnold Weissberger), Vol. 7, Organic Solvents, completely revised second edition by John A. Riddick and Emory E. Toops, Jr., *review*, 639
Chemistry (Physical), in Queen Mary College, London, 68
Chemistry (Protein) : Advances in (edited by M. L. Anson, Kenneth Bailey and John T. Edsall), Vol. 9, *review* by Prof. J. A. V. Butler, 295
Chemistry (Pure and Applied) (Analytical Chemistry) : Fifteenth International Congress of, 653
Chemistry (Pure and Applied), International Union of : First International Congress on Documentation of Applied Chemistry, 168
  Further Session of the Inorganic Nomenclature Commission, 464
Chemistry (Pure and Applied), International Union of (Commission on Macromolecules), and the Weizmann Institute of Science . International Symposium on Macromolecular Chemistry (Polymers, Biocolloids and Polyelectrolytes in Solution), 562, 1161
Chemistry (Structural), of Proteins (Prof. H. D. Springall), *review* by Prof. J. A. V. Butler, 404
Chemistry (Theoretical) . Summer School in (University of Oxford), 562
Chemistry Students : Mathematics for, *review*, 678
Chemistry and Biochemistry of Fats, *review* by Prof A. C. Frazer, 1050
Chemistry, Biochemistry and Pharmacology of Thioctic Acid (Symposium at the University of Naples), 75
Chemistry and Chemical Engineering : The Principles of Chemical Equilibrium, with Applications in (Prof Kenneth Denbigh), *review*, 1145
Chemistry and Crop Nutrition (Sir William Ogg), 208
Chemistry and Fertility of Sea Waters (Dr. H. W. Harvey), *review* by Michael Graham, 549
Chemistry and Industrial Applications of Cereals : Recent Advances in the (Royal Institute of Chemistry Symposium on), 1018
Chemistry and Physiology of Phospholipids—Symposium in Ontario (Dr. James F. Berry), 21
Chemistry Institute at Bogor, Indonesia : New methods of chemical analysis to be taught by H. J. Wood, on loan by the Dominion Laboratory, Department of Scientific and Industrial Research, New Zealand, 118
Chemists, British Association of : Hinchley Medal for 1955 awarded to T. McLachlan, 464
Chemists (Biological), Society of (India) : Silver Jubilee Souvenir, 778
Chemists and Chemical Engineers : Thermodynamics for, *review*, 1145
Cherry, Dr. Colin : Servo-Mechanisms and Control Systems, *review*, 351
Cherry, Dr. Colin, and others : Studies in Communication contributed to the Communication Research Centre, University College, London, *review* by Prof. G. Patrick Meredith, 446
Cherwell, Lord : Opening Address at the First International Congress on Documentation of Applied Chemistry, 168
  Physics and Philosophy (First Robert Grosseteste Memorial Lecture), 214
  Resignation from the Lee chair of experimental philosophy in the University of Oxford, 1155 ; work of, 1155
Chicago Natural History Museum : Retirement of Dr. K. P. Schmidt as chief curator of the Department of Zoology, 507
  Fieldiana, Vol. 24, Part 2 Flora of Guatemala (J. R. Swallen), Part 2, Grasses, 1025
  Fieldiana, Vol 37, Published as a tribute to Dr. K. P. Schmidt, 507
  Fieldiana, Anthropology, Vol. 44, No. 2, Old Akkadian Tablets from the Middle East (Prof. Ignace J. Gelb), 735
Chick, A. L. : Teaching of Atomic and Nuclear Physics, 780
Chickens : Effect of Supplementary Choline and Methionine on the Response of, to Folic Acid (M. W McDonald), 343
Chickens and Turkeys which are Tolerant of each others' Antigens : Attempts at Hybridization of (Margaret Ryle and M. Simonsen), 437
Child's Construction of Reality (Prof. Jean Piaget), translated from the French by Margaret Cook, *review* by Prof. O. L. Zangwill, 907
Childe, Prof. V. Gordon . Resignation from the chair of prehistoric European archæology in the University of London and the directorship of the Institute of Archæology, 15 ; work of, 15
Children : Maladjusted (Report of the Committee of the Ministry of Education), 973
Children's Film Foundation, 269
Childs, Dr. C B. : Elected a Fellow of the Royal Society of Edinburgh, 506
Chile : The *Atlantis* Marine Geological Expedition to Peru and (Dr. Parker D Trask), 454
Chilver, Dr. G. E. F. : The Age-Group Bulge and its Possible Effect on University Policy, 115
Chimaeras (Radiation-) : Cytological Identification of (Dr. C. E. Ford, J. L. Hamerton, D. W. H. Barnes and Dr. J. F. Loutit), 452
Chimie biologique, Société de : Charles Mayer Prize for 1955 awarded to Prof. S. Ochoa and Mme. M. Grunberg-Manago, 17
Chimie physique, Société de Annual Meeting (Superficial Reactions of Gases on Metals), 693
Chimney-Stack : Effect at Ground-level of Gas from a (Dr. A. C. Best), 611
Chinese and Japanese : The *Diego* Blood Factor in (Dr. Miguel Layrisse and Dr. Tulio Arends), 1083
Chinese Astronomical Clockwork (Dr. Joseph Needham, Wang Ling and Dr. Derek J. Price), 600
Chippendale, P Electron Microscopy of Fibres, 319
Chirvinsky, Prof. P. N. : *Obituary* by Dr. S. I. Tomkeieff, 259
Chisholm, Dr. J. S. R. . Theoretical Physics, 268
Chitoku, Kazuo, and others : Photoelectric Phenomena with Copper Phthalocyanine, 672
Chittenden, F. J. : Index to Vols. 1–164 of *Curtis's Botanical Magazine*, 735
Chittenden, Russell H. (1856–1943), 311
p-Chlorbenzene Iododichloride : Crystal Structure of (D. A. Bekoe and Ralph Hulme), 1230
Chlorella vulgaris : An Electron Microscopical Study of the Histochemical Localization of Alkaline Phosphatase in the Cell Wall of (Dr. D. Brandes and Dr. R. N. Elston), 274
Chlorella vulgaris Beij and *Anabaena cylindrica* Lemm : Vitamin B_{12} Activity of (F. Brown, Dr. W. F. J. Cuthbertson and Dr. G. E. Fogg), 188
2-Chloroethyl Methanesulphonate in *Drosophila melanogaster* : Mutagenicity of (O. G Fahmy and Myrtle J. Fahmy), 996
Chloroplastin (Algal) : Molecular Weight of (J. J. Wolken and F. A. Schwertz), 136
Chlorpromazine : Action of, on Oxidative Phosphorylation of Liver and Brain Mitochondria (Magdalena Berger, H. J. Strecker and Prof. H. Waelsch), 1234
  Inhibitory Action of, on the Oxidation of D-Amino-Acid in the Diencephalon Part of the Brain (Dr. Kunio Yagi, Toshiharu Nagatsu and Takayuki Ozawa), 891
Choline and Methionine : Effect of Supplementary, on the Response of Chickens to Folic Acid (M. W. McDonald), 343
Cholinesterase (Pseudo-), in the Central Nervous System of the Frog (D. C. Hardwick and Dr. Catherine Hebb), 667

Chowdhury, K. A., and others · Septate Fibres in Angiosperms and their Length, 1243
Chown, Dr. Bruce, and others The Blood Group Antigen *Diego* in North American Indians and in Japanese, 1084
Christian, Dr. J. W. : Mechanism of Phase Transformations in Metals, 419
Christian Beliefs · Modern Science and (Dr. Arthur F. Smethurst), *review* by the Very Rev. Dr. W R. Matthews, 638
Christidis, Prof. Basil G., and Harrison, George J. : Cotton Growing Problems, *review* by Dr. W Lawrence Balls, 597
Chromatografie : Papirová (edited by Dr. I. M. Hais and Dr. K. Macek), *review* by Dr. R. Consden, 352
Chromatographic Behaviour of Hæmoglobin *E* (H. K. Prins and Dr. T. H. J. Huisman), 840
Chromatographic Detection of Free Amino-acids in Normal and Iron-deficient Plants of *Hibiscus esculentus* L. (S. D. Démétriades), 95
Chromatographic (Paper), Identification of the 2 . 4-Dinitrophenyl-Derivatives of Aliphatic Amines (I. M. Lockhart), 393
Chromatographic and Spectroscopic Properties of Ellagic Acid, and its Occurrence in Dicotyledonous Plants (Dr D. E. Hathway), 747
Chromatography : Vapour Phase (Hydrocarbon Research Group of the Institute of Petroleum Symposium on), 968
Chromatography (Gas-Liquid Partition) : Use of, as a Preparative Method (D. Ambrose and R. R. Collerson), 84
Chromatography (Paper) : A Manual of, and Paper Electrophoresis (Richard J. Block, Emmett L. Durrum and Gunter Zweig), *review* by Dr. R. Consden, 300
Chromatography (Paper), of Insulin (Dr. G. Grodsky and Dr. H. Tarver), 223 , (Dr. Albert Light and Dr. Melvin V. Simpson), 225
Chromatography (Paper Partition), of Sugars Temperature Effects in the (Margaret Alcock and J S Cannell), 327
Chromatography (Quantitative Paper), of Sugars : A New Solvent for (Dr Giovanni Giovannozzi-Sermanni), 586
Chromatography (Reversed-Phase Paper Partition) · Separation of the Isomers of Benzene Hexachloride by (R. G. Bridges, A. Harrison and F. P. W. Winteringham), 86
Chromatography and Partition of Cells and Cell Fragments (Per-Åke Albertsson), 771
Chromium, Vanadium and Tungsten : Determination of, by Activation Analysis using Low-Level Neutron Sources (Prof. M. Huaringa), 85
Cr_2O_3 · Changes in Lattice Constant of, near the Curie Temperature (Selma Greenwald), 286
Chromosomal Polymorphism in a Bark Weevil (Dr Stanley G. Smith), 386
Chromosome Breakage in Endosperm · Spontaneous (Dr. A. Rutishauser and L. F La Cour), 324
Chromosome Counts in Orobanchaceae : Further (David J. Hambler), 438
Chromosome Number : Nucleic Acid Content and Distribution of, in Original and Sublines of Two Mouse Ascites Tumours (Dr. John S. Colter, Harris H. Bird, Hilary Koprowski and Hilda B. Ritter), 993
Chromosome Number of Plants : Fixity in (Arun Kumar Sharma and Archana Sharma (*nee* Mookerjea)), 335
Chromosome Number in Rabbit Blastocysts (Ole Venge), 384
Chromosome Numbers in *Oxalis* (G. E. Marks), 735
Chromosome Numbers in Three Species of *Uronema* (Y. S. R. K. Sarma), 900
Chromosomes (Conference in the State Agricultural University, Wageningen), 464
Chromosomes of the Common Shrew (G. B Sharman), 941
Chromosomes of Five Rodent Species (C E. Ford and J. L. Hamerton), 140
Chromosomes, Genes and Macromolecular Systems' (Prof. Francis O. Schmitt), 503
Chromospheric Granulation : Correlation Patterns in the (J. T. Jefferies and R. E. Loughhead), 180
Chronic Respiratory Disease of Turkeys . A Virus in (J. A. Fahey), 90
Church, H F. : Fibre Microscopy, 516
α-Chymotrypsin : Effect of Urea on Trypsin and (Dr. J. Ieuan Harris), 471
Ciba, Ltd , Basle : Gift of £700 a year for three years to the University of Birmingham, for a Ciba research scholarship in the techniques of organic chemistry, 693
Ciba Foundation : Symposium on Experimental Tuberculosis—Bacillus and Host, with an Addendum on Leprosy (edited by G. E. W. Wolstenholme and Margaret P. Cameron), *review* by Dr. Derek Hobson, 448
Ciel : Atlas du (Vincent de Callatay), *review* by Prof. C W. Allen, 957
Cigarette Smoke : Assay of Possible Carcinogenic Hydrocarbons from (M. J. Lyons), 630
Ciliary Feeding Mechanisms of Brachiopods (Dr. A. Atkins), 706
Cinader, B., and Dubert, J. M. : Immunological Tolerance, 869
Cinematography in Scientific Research, *review* by Prof. G. E H. Foxon, 298
Ciona intestinalis · Organic Binding of Iodine in the Endostyle of (Prof. E. J. W. Barrington and L. L. Franchi), 432
Citizens of Tomorrow, a Study of the Influences affecting the Upbringing of Young People (King George's Jubilee Trust), 149
City and Guilds College, London : Report on Research Work in the, 1952–55 (Imperial College of Science and Technology), 570
City and Guilds of London Institute : Conferment of Fellowships, 363
Civil Defence : Manual of, Vol. I, Pamphlet No. I, Nuclear Weapons (Home Office and Scottish Home Department), 262
Civil Service : A History of Red Tape, an Account of the Origin and Development of the (Sir John Craig), *review* by R. B., 154
Civil Service (Oversea) : Central Pool of Officers for the, 1017
Civil Service (Scientific) : Promotion of Individual Research Workers, 218
Claassen, H. H. . Spectroscopy, 738
Clapham, Prof A. R. : Appointed a member of the Nature Conservancy, 1015
Clark, Dr. A. M . Genetic Effects of X-Rays in relation to Dose-rate in *Drosophila*, 787
Clark, F. Le Gros, and Dunne, Agnes C. : Ageing in Industry, *review* by Prof. John Cohen, 449
Clark, Miss J. E. (Heath, Dr. O. V. S., and) : Chelating Agents as Plant Growth Substances—a Possible Clue to the Mode of Action of Auxin, 1118
Clarke, Dr. D. W., and others : Effects of Pituitary Growth Hormone on the Insulin and Hyperglycæmic-glycogenolytic Factor extractable from the Pancreas of Obese-Hyperglycæmic Mice, 1235
Clarke, G. F. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 219 ; work of, 219
Clarke, J. E. : Appointed entomologist, Game and Tsetse Control, Northern Rhodesia, 561
Clarke, J. F Gates : Catalogue of the Type Specimens of Microlepidoptera in the British Museum (Natural History) described by Edward Meyrick, *review* by Dr. G. C. Varley, 1005
Clarke, Miss S K R. : Appointed lecturer in bacteriology and virus diseases at the University of Sheffield, 17
Clason, W. E. (compiled and arranged on an English alphabetical base by) : Elsevier's Dictionary of Television, Radar and Antennas in Six Languages, *review* by Dr. R. L. Smith-Rose, 1099
Classic and Generalized Standpoints : Thermodynamics from the (Dr. Joseph Louis Finck), *review* by R. W. Haywood, 1006
Classification of Crystallographic Data : Collection and (X-Ray Analysis Group of the Institute of Physics Discussion on), 1069
Classification of the Phylum Brachiopoda : A History of the (Dr. Helen Marguerite Muir-Wood), *review*, 642
Claviceps purpurea Tul. : Role of Ergothioneine and Catalase in Infection by Ergot Fungus (A. St. Garay), 91
Clay Conference in the United States . Fourth National (Dr. D. M. C. MacEwan), 368
Clay-Water Systems Yield Stress of (Dr. A. Packter), 144
Cleland, K W : Acrosome Formation in Bandicoot Spermiogenesis, 387
Clemedson, Carl-Johan, and others Propagation of an Air-transmitted Shock Wave in Muscular Tissue, 380
Clemmow, P C. : Movements in the Ionosphere, 308
Climate · Effects of, on Body Temperature and Respiration-rate of Buffaloes and Friesian Cattle (Dr. K. A. Alim and I. A. Ahmed), 900
Clingfishes (Order Xenopterygii) A Monograph of the (John C Briggs), *review* by N. B Marshall, 722
Clinical Research : Fellowships in (Medical Research Council), 70
Clockwork Chinese Astronomical (Dr. Joseph Needham, Wang Ling and Dr. Derek J. Price), 600
Cloud, W. M., and others . Spectroscopy, 737
Cloud Chambers : Apparent Velocity of Alpha-Particles in (Prof. J. A. Prins and S. A. Hempenius), 487
Cloud Physics (Physical Society and the Royal Meteorological Society Conference on), 320
Clouds (Atmospheric) Physics of (F. H. Ludlam), 320
Clouds (Cosmic) · Gas Dynamics of—a Symposium held at Cambridge, July 6–11, 1953 (edited by H. C. van de Hulst and J. M. Burgers), *review* by Dr. F. D Kahn, 352
Clough Memorial Research Fund of the Edinburgh Geological Society : Grants for Geological Research in Scotland and the north of England, 415
Clouston, J. G. (Cook, Dr. C. L., and) : Absorption Spectra arising from the Photolysis of Lead Tetramethyl, 1178
Clover · Reduction in Growth of, due to Applied Molybdenum (R. H. Jackman), 755
Clover (White), and Perennial Ryegrass : Components of the Total Magnesium Content within the Leaves of (T F. Neales), 388
Clover Virus causing Green Petal Disease in Strawberry : Leafhopper Transmission of a (N. W. Frazier and A. F. Posnette), 1040
Clow, Dr. Archie : The Presentation of Science to the Public, 1066
Co-operation : Conflict versus, as Factors in Evolution (Dr. Sunder Lal Hora), 781
Coal Board, National : Mining Research Establishment, Isleworth, of the (Dr. L. C. Tyte), 958
  International Conference on Chemical Engineering in the Coal Industry, 1018
Coal Industry · Chemical Engineering in the (National Coal Board International Conference on), 1018
  Momentum of Decline of the (A. H. A. Wynn), 514
Coal Industry (British) Man-power in the, 514
Coal and Steel Community : European (Political and Economic Planning, Broadsheet No. 389), 1205
Coal and Steel Community, European (Council of Europe and the High Authority of the) : Fellowships for research into problems of European interest, 263
Coals New X-Ray Data on (L. Cartz, R. Diamond and P. B. Hirsch), 500
Coates, M. E. (Holdsworth, Dr. E. S., and) : Absorption of Vitamin B_{12} from the Rat Intestine, 701
Coblenz, Abraham, and Owens, Harry L. : Transistors, *review* by J. R. T., 301
Coccoliths (Fossil) : Examination of, in the Electron Microscope (Dr. C. Downie and Prof. R. W. K. Honeycombe), 947
Cochrane, Dr. W. (Barnett, Dr. C. H., and) : Flow of Viscous Liquids in Branched Tubes, with reference to the Hepatic Portal Vein, 740
Cockcroft, Sir John The United Kingdom Atomic Energy Authority and its Function, 204
  Research Reactors in the United States, *review*, 593
  Awarded the Kelvin Gold Medal for 1956, 1014
Cockroach · Physiology of the Locomotory Muscles in the (G. Becht and Dr. D. Dresden), 836
Cockroach Cerebrum : Electrical Activity in the (Donald M. Maynard), 529
Coddington, Prof. Earl A., and Levinson, Prof. Norman : Theory of Ordinary Differential Equations, *review*, 722
Codling (*Gadus callarius*) : Discoloration of Muscle Preparations from, by Degradation Products of 1-Methylhistidine (Dr. N. R. Jones), 748
Coefficient for Hydrogen · The First Townsend Ionization (D. J. Rose, D. J. De Bitetto and L. H. Fisher), 945
Coefficient of Work-hardening in Polycrystalline Metals : Relation between the Initial Instantaneous Extension in Creep and the Yield Stress and (Dr. Paul Feltham), 632
Coetzee, Dr. V. : *Meloidogyne acronea*, a New Species of Root-Knot Nematode, 899
Coffey, Dr. S. : Dyestuffs Chemistry, *review*, 498
Coghlan, Dr. Joyce D., and others : Leptospirosis in Piggery Workers, 1042
Cohen, Prof. John : Language of the Emotions, *review*, 247
  Optimal Span of Working Life, *review*, 449
Cohen, V. W. Spectroscopy, 737
Coherent Beams of Light : Correlation between Photons in Two (R. Hanbury Brown and R. Q. Twiss), 27
Cohesion in Zululand : Conflict and (Prof. Max Gluckman), 215

Cohn, Dr W. E. : The Structure of Nucleic Acids and their Role in Protein Synthesis, 603
Coins (Parthian) : Chemical Composition of (Earle R. Caley), 23
Coke Research Association, British : Gift of £3,500 to the Department of Coal Gas and Fuel Industries in the University of Leeds, to support research on the disposal of effluents, 463
Colarusso, Prof. A. : Chemistry, Biochemistry and Pharmacology of Thioctic Acid, 75
Cold Spring Harbor : Twenty-first Symposium on Quantitative Biology (Genetic Mechanisms—Structure and Function), 877
Coldwells, J. L. : Appointed assistant conservator of forests, Nyasaland, 70
Cole, C. P. (O'Neill, Dr. L. A., and) : Epoxide Resins, 963
Cole, Dr D. F. : The Neurohypophysis, 1020
Cole, J. S. : Pathogenicity of *Botrytis cinerea*, *Sclerotinia fructigena* and *S. laxa*, 738
Cole, K. S. : Elected a Member of the National Academy of Sciences, Washington, 926
Cole Museum of Zoology, University of Reading, 555
Coles, Dr. J. A., and others : Steric Effects in Anionotropic Rearrangements, 1167
Colgate, Dr. R. T. : Fellowship of the City and Guilds of London Institute conferred on, 363
Coliform Organism (*Escherichia*) : Effect of a, on the Second Ecdysis of Nematode Larvæ parasitic in the Horse (D. Poynter), 481
Collagen : Structure of (Prof. G. N. Ramachandran), 710
Collagen Fibril : Helical Nature of the (Dr. R. Reed, Miss M. J. Wood and Dr. M. K. Keech), 697
Collagen—Diluent Mixtures : Evidence for a Reversible First-Order Phase Transition in (R. R. Garrett and Prof. P. J. Flory), 176
Collection and Classification of Crystallographic Data (X-Ray Analysis Group of the Institute of Physics Discussion on), 1069
College of Technology, Bristol, in collaboration with the Regional Council for Further Education for the South West) : Course on the Applications of Radioactive Isotopes in Industry and their Uses as Tracers, 1065
College Chemistry (Prof. Linus Pauling), second edition, *review*, 597
Colleges of Advanced Technology, 1204
Colleges (Technical) : Awards for Advanced Courses at, 607
Collerson, R. R. (Ambrose, D., and) : Use of Gas-Liquid Partition Chromatography as a Preparative Method, 84
Colless, Donald H. : Environmental Factors affecting Hairiness in Mosquito Larvæ, 229
Collier, Dr. H. O. J. : The Presentation of Science to the Public, 1066
Collins, W. B. : Appointed conservator of forests, Gold Coast, 1207
Collinson, Dr. E., and Dainton, Prof. F. S. : Termination of Chains in Vinyl Polymerization by Metal Salts, 1224
Colloids and their Behaviour (Sir Eric Rideal), 263, 865
Colombo Plan Technical Co-operation Scheme : Report for 1954–55, 197, 513
Colonial Advisory Council of Agriculture, Animal Health and Forestry : Amendment of the terms of reference, 966
Colonial Agricultural, Animal Health and Forestry Research (Committee for) : Report for 1954–55, 365, 416
Colonial America : Lewis Evans (1700–56), a Scientist in (Prof. George W. White), 1055
Colonial Development Corporation : Annual Report for 1955, 1049
Colonial Economic Research Committee : Report for 1954–55, 365, 417
Colonial Fisheries Advisory Committee : Report for 1954–55, 365, 418, *erratum*, 1018
Colonial Insecticides, Fungicides and Herbicides Committee : Report for 1954–55, 365, 417
Colonial Medical Research Committee : Report for 1954–55, 365
Colonial Office : Appointments in the Oversea Service Division, 70, 561, 736, 831, 1112, 1207
  Colonial Research 1954–55, 365, 416
Colonial Office and the University of Birmingham : Contract for the geological work of the Falkland Islands Dependencies Scientific Bureau to be done in the Department of Geology at Birmingham, 1110
Colonial Products Council : Report for 1954–55, 365
Colonial Research, 1954–55 (Colonial Office), 365, 416
Colonial Research : Scientists for, 734
Colonial Research in the British Commonwealth, 365, 416, *erratum*, 1018
Colonial Research Council : Report for 1954–55, 365
Colonial Social Science Research Council : Report for 1954–55, 365
Colonial Territories : Fifth Annual Report of the Fulbright Program in the United Kingdom and (1949–1954), 566
Colonization of Virginia : Raleigh's Attempted, *review* by Prof. Arthur Davies, 544
Colorimetric Determinations of Total Silica : Ion-Exchange Preparation of Low-Silica Hydroxide Solutions for (Sallie Fisher and Robert Kunin), 1125
Colorimetric Methods of Analysis, including some Turbidimetric and Nephelometric Methods (Dr. Foster Dee Snell and Dr. Cornelia T. Snell), Vol. 3, Organic (1), Vol. 4, Organic (2), *review* by J. King, 201
Colour Centres in Metaphosphate Glass (James H. Schulman), 287, (Sadhan Basu), 287
Colour Illusions and Aberrations during Stimulation by Flickering Light (Dr. W. Grey Walter), 710
Colour Responses of the Minnow resulting from Inhibition of Movement : Abnormal (Dr. E. G. Gray), 91
Colour Television : An Introduction to (G. G. Gouriet), *review* by G. R. Noakes, 497
Colour Television in Britain : Future of (Sir Ian Jacob), 690
Colouring Matters : Recent Advances in the Chemistry of (Chemical Society Symposium on), 69, 645
Colover, J., and Consden, Dr. R. : Experimental Allergic Encephalomyelitis produced by Tubercle Bacillus Residues, 749
Colowick, Sidney P., and Kaplan, Nathan O. (edited by) : Methods in Enzymology, Vol. 1, Preparation and Assay of Enzymes, *review* by Dr. J. R. Turvey, 810
Colston Research Society and the University of Bristol : International Symposium on the Neurohypophysis, 561, 1019
Colter, Dr. John S., and others : Nucleic Acid Content and Distribution of Chromosome Number in Original and Sublines of Two Mouse Ascites Tumours, 993
  Immunological Studies with Protein Fractions isolated from Ehrlich Ascites Carcinoma Cells, 994
Columbia University : Proceedings of a Conference on the Utilization of Scientific and Professional Manpower (National Manpower Council), 675
Comar, C. L. : Radioisotopes in Biology and Agriculture, *review* by Dr. E. H. Belcher, 638
Combinatorial Design for Experiments with Alternative Responses (K. Strzemienski), 283
Combustion : Some Fundamentals of (Dr. D. B. Spalding), *review* by F. D. Robinson, 548
  International Symposium on (Combustion Institute), 1159
Combustion Institute : Incorporation of the, 213
  International Symposium on Combustion, 1159
Combustion Theory : Heat and Mass Transfer in, *review* by F. D. Robinson, 548
Commercial Pesticides : Modern Development of, 652
Commercial and Industrial Education, British Association for (Ministry of Education and the) : Conference on the Development of Sandwich Courses, 464
Commonwealth (British) : Colonial Research in the, 365, 416, *erratum*, 1018
  Human Problems of Industrial Communities within the (Conference on), 1113
Commonwealth (British) Scientific Organization (North America) : Notes on Science in U.S.A., 1954, 76
Commonwealth Bureau of Dairy Science : Title changed to the Commonwealth Bureau of Dairy Science and Technology, 922
Commonwealth Fund, New York : Thirty-seventh Report (1954–55), 696
  Fellowships, 735
  Grants for Medical Education in the United States, 1064
Commonwealth Observatory, Mount Stromlo, Canberra : The 74-in. Reflector of the, 357
Commonwealth Scientific and Industrial Research Organization, Australia : Appointment of Dr. G. F. Humphrey as chief of the Division of Fisheries and Oceanography, 461
  Bulletin No. 278 : The Beef-Cattle Industry of Australia (W. A. Beattie), 1063
  New members of the Advisory Council, 734
Communication : Studies in, contributed to the Communication Research Centre, University College, London (A. J. Ayer, J. B. S. Haldane, Colin Cherry, Sir Geoffrey Vickers, Dr. B. Fry, J. Z. Young, R. Wittkower, T. B. L. Webster and Randolph Quirk), *review* by Prof. G. Patrick Meredith, 446
  Talking about, *review* by Prof. G. Patrick Meredith, 446
Communication Research Centre, University College, London : Studies in Communication contributed to the (A. J. Ayer, J. B. S. Haldane, Colin Cherry, Sir Geoffrey Vickers, D. B. Fry, J. Z. Young, R. Wittkower, T. B. L. Webster and Randolph Quirk), *review* by Prof. G. Patrick Meredith, 446
Community : The Place of the Australian University in the, and Post-Graduate Studies in the Australian Universities (Australian Vice-Chancellors' Committee Symposium on), 1071
Comparative Antiœstrogenic Potencies of Progesterone and 17 α-Hydroxyprogesterone (Dr. Elvira Mardones, Dusan Jadrijevic and Prof. A. Lipschutz), 478
Comparisons of Radioactivity Standards : International (Dr. A. V. Astin, Sir Edward Bullard and Dr. W. B. Lewis), 12
Complementary Action of Melibiase and Galactozymase on Raffinose Fermentation (Prof. O. Winge and Dr. Catherine Roberts), 383
Complex (Phenolase) : Structures and Functions of the (Dr. H. S. Mason), 79
Complex Formation in Dilute Solution : Modification of the Bulk Mechanical Properties of Water by (T. Nash), 948
Complex Polysaccharides of Plants : Incorporation of Carbon-14 into the (Dr. L. Hough and Dr. J. B. Pridham), 1039
Complex Systems in Rapid Reversible Equilibrium : Boundary Problems in the Sedimentation and Electrophoresis of (Dr. G. A. Gilbert and R. C. Ll. Jenkins), 853
Complexes (Olefin), of Rhodium (Dr. J. Chatt and L. M. Venanzi), 852
Components of the Total Magnesium Content within the Leaves of White Clover and Perennial Ryegrass (T. F. Neales), 388
Components (Water-soluble) of Herbage : Avidity of the, for Added Cupric Ions (C. F. Mills and Grace Murray), 793
Composition of Egg Phospholipids (Dr. D. N. Rhodes and Dr. C. H. Lea), 1129
Composition of Gangliosides from Human Brain (Prof. Lars Svennerholm), 524
Composition of a Hypertensin Peptide (Dr. W. S. Peart), 132
Composition of the Parotid Saliva of Sodium-depleted Sheep : Delayed Effect of Ipsilateral Intracarotid Infusion of Sodium Chloride on the (I. R. McDonald and Dr. D. A. Denton), 1035
Composition and Nutritive Value of Flour : Report of the Panel on, 1150
Compound 48/80 (Anaphylactic Shock and) : Effects of, on the Mast Cells of the Guinea Pig Lung (Dr. Ivan Mota and Itamar Vugman), 427
Compounds with Condensed Thiophene Rings (Howard B. Hartough and S. L. Meisel), *review*, 408
Compounds (Carbon) : Chemistry of (edited by Dr. E. H. Rodd), Vol. 3, Part A, Aromatic Compounds, *review* by Prof. R. A. Raphael, 1101
Compounds (Iron-binding) : Formation of, by Micro-organisms (J. A. Garibaldi and Prof. J. E. Neilands), 526
Compounds (Organic) : Handbook of, *review*, 639
Compounds (Oxygenated Heterocyclic) : Chemistry of—International Colloquium at Lyons, 1116
Compounds (Purine), in Snake Venoms (Hazel M. Doery), 381
Compressed Air Hygrometer for Measuring Frost Point in the Stratosphere (R. J. Murgatroyd, P. Goldsmith and W. E. H. Hollings), 568
Compression : Effect of Shape on the Static and Dynamic Stress-Strain Relationship of Bonded Rubber in (A. R. Payne), 1174
Compton, D. M. J. : Semiconductors, 833
Computer Techniques : Digital (Institution of Electrical Engineers Convention on), 1069

Computers (Electronic), in Molecular Quantum Mechanics, 362
Computers (Small Digital) : Design and Application of (Proceedings of the Conference held by the Eastern Section of the Joint Computer Committee), 462
Computing Machines (Automatic Digital) · Programme Design for (Mathematical Laboratory of the University of Cambridge Summer School in), 922
Computing Service at the Franklin Institute, Philadelphia, 1206
Concrete : Precast (Dr. Kurt Billig), *review* by T. Whitaker, 200
Condensation Nuclei . Proceedings of the First International Symposium on, at Dublin, April 1955 (edited by Mario Bossolasco), *review* by B J. Mason, 1008
  Second International Symposium on, 877
Condensed Thiophene Rings Compounds with (Howard B. Hartough and S. L. Meisel), *review*, 403
Condon, Dr E. U. : Appointed professor of physics and chairman of the Department of Physics of Washington University, St. Louis, Mo., 1109 ; work of, 1109
Conductance (Low-) Surface Membrane in *E. coli* : A Dielectric Study of the (Dr. Hugo Fricke, Herman P. Schwan, Kam Li and Vernon Bryson), 134
Conductivity (Thermal), of Soil (John Webb), 989
Conductivity (Thermal), of Solid Argon at Low Temperatures (Dr. G. K. White and Dr. S. B Woods), 851
Cones : Occurrence of Triple and Quadruple, in the Retina of the Minnow (*Phoxinus laevis*), (Miss A. H. Lyall), 1086
Configuration : Resolution by means of a Micro-organism of Racemic Diaminosuccinic Acid and Determination of its (Sakaru Suzuki, Hisao Makishima and Noboru Suzuki), 280
Conflict in Africa : Custom and (Prof Max Gluckman), *review* by Dr. E. R. Leach, 1098
Conflict versus Co-operation as Factors in Evolution (Dr. Sunder Lal Hora), 781
Conflict and Cohesion in Zululand (Prof Max Gluckman), 215
Congo (Belgian) Abnormal Hæmoglobins in the Kasai Province of the (Dr. J. Vandepitte and Dr. Arno G. Motulsky), 757
Conjugate Points (Geomagnetically) · Observations of Whistling Atmospherics at (M. G. Morgan and H. E. Dinger), 29 ; (M. G. Morgan and G. McK. Allcock), 30
Conn, Dr. G. K. T. : Appointed professor of physics in the University of Exeter, 1062 ; work of, 1062
Connective Tissue and its Changes with Age (British Society for Research on Ageing Conference on), 467
Connell, George E , and Hanes, Prof Charles S. · Enzymic Formation of Pyrrolidone Carboxylic Acid from γ-Glutamyl Peptides, 377
Conover, Dr. L. H. : Antibiotics and Mould Metabolites, 1059
Conquest of the Upper Air : 200 Miles Up, the (J. Gorden Vaeth), second edition, *review* by G. R. Noakes, 862
Consden, Dr. R. : A Manual of Paper Chromatography and Paper Electrophoresis, *review*, 300
  Papirová Chromatografie, *review*, 352
Consden, Dr. R. (Colover, J., and) · Experimental Allergic Encephalomyelitis produced by Tubercle Bacillus Residues, 749
Conservation (Nature), for Teachers, *review* by Dr. Maurice Ashby, 678
Conservation and Resource-Use : Handbook for Teaching of (prepared by the National Conservation Committee of the National Association of Biology Teachers in conjunction with the American Nature Association), *review* by Dr. Maurice Ashby, 678
Conservatoire National des Arts et Métiers (Department of Mechanics) : International Congress on Automation, 1018
Consistency of Design in Living Forms . Regularity and (Dr. P. Weiss), 1157
Consolidated Gold Fields of South Africa, Ltd., Gold Medal for 1954–55 of the Institution of Mining and Metallurgy awarded to J. F. G. R. Heywood, 966
Consolidated Gold Fields of South Africa, Ltd , Premium for 1954–55 of the Institution of Mining and Metallurgy awarded to Dr. J. J. Brummer, 966
Consolidation of the Crofting System, 1750–1850 (Malcolm Gray), 1071
Constant, H. : Propulsion Problems in High-Speed Flight, 1196
Constants (Thermionic), of Semi-conductors (Sir K. S. Krishnan and Dr. S. C. Jain), 285
Constitution of the Cyclic Polyamides isolated from Nylon 6 Polymers · Cyclic Polyamides from Nylon 6 and 6 6 Polymers— (Dr. P. H Hermans), 126
Constitution of the Cyclic Polyamides isolated from Nylon 66 Polymer Cyclic Polyamides from Nylon 6 and 6 6 Polymers— (C. J Brown, A. Hill and P. V. Youle), 128
Contemporary Thought : Psycho-Analysis and (British Psycho-Analytical Society's Lectures to commemorate the centenary of the birth of Sigmund Freud), 363
Continuous-Wave Radio . A Simple Method of Studying Winds in the Ionosphere by using (Dr B. Ramachandra Rao and D Satyanarayana Murty), 1222
Contraction : A New Muscle Preparation for the Study of Optical Changes during (Dr. B. C. Abbott and Dr. J Lowy), 788
Contraste de Phase : Le Microscope à, et le Microscope Interférentiel (Maurice Françon), *review*, 680
Contribution by Immigrants The Positive (Symposium prepared for Unesco by the International Sociological Association and the International Economic Association), 1164
Control · Wastage and its, *review*, 720
Control of Government Research in Britain, 805
Control of Plant Nematodes 'Solubilized' Chemicals for the (L. N. Staniland), 97
Control of Seasonal Variation in the Egg Production of Hens (J. C. D. Hutchinson), 795
Control of the Staining Procedure after Paper Electrophoresis (Dr. Ch. Wunderly), 586
Control (Automatic), in the Process Industries (Institution of Chemical Engineers and the Society of Instrument Technology Conference on), 252
Control (International), of Nuclear Weapons, 17
Control (International), of Pelagic Fisheries, 966
Control (Physiological), of Population Growth (Sir Solly Zuckerman), 58
Control (Predator), in America, 1157
Control (Spiracular), of Discontinuous Respiration in Insects (Dr. Howard A. Schneiderman), 1169
Control Systems : Servo-Mechanisms and, *review* by Dr. Colin Cherry, 351
Controlled Thermonuclear Energy (United Kingdom Atomic Energy Authority Symposium on), 1016
Convection (Heat), from the Earth's Surface (C H. B. Priestley), 435
Convection Patterns (Thermal) : Influence of a Magnetic Field on (W. C. Levengood), 631, *erratum*, 779
Conversion of Phenylalanine into Tyrosine in the Silkworm Larva (*Bombyx mori*), (T. Fukuda), 429
Convulsant Alkaloid of *Dioscorea dumetorum* (Prof. C. W L Bevan, Dr. J. L. Broadbent and J. Hirst), 935
Conway, Dr. Elsie : Effects of Gamma-(2 : 4-Dichlorophenoxy)-butyric Acid on Sporelings of Bracken, 1088
Conway, J G. : Spectroscopy, 738
Cook, Dr. C. L., and Clouston, J G. Absorption Spectra arising from the Photolysis of Lead Tetramethyl, 1178
Cook, J. · Appointed senior agricultural officer, grade A, Federation of Malaya, 736
  Appointed director of agriculture, Sarawak, 831
Cook, Dr. Maurice, and others : Given a Capper Pass Award for 1955 by the Institution of Mining and Metallurgy and the Institute of Metals, 363
Cooke, Dr. G. W. : Appointed head of the Chemistry Department of Rothamsted Experimental Station, 559 ; work of, 559
Cooke, Dr. H. B S. . Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 165
Cooke, R. G. · Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 165
Cooke-Yarborough, E. H. · Promoted to Deputy Chief Scientific Officer in the Scientific Civil Service, 218 , work of, 218
Cookson, Dr Isabel C. . Pollen Grains of the *Ephedra* Type in Australian Tertiary Deposits, 47
Cooper, C. W. : Electrical Equipment of Aircraft, 1211
Cooper, Prof. M McG. Elected a Fellow of the Royal Society of Edinburgh, 506
Cope, Arthur C., and others (edited by) : Organic Reactions, Vols. 7 and 8, *review* by Prof. John Read, 249
Copolymers (Block) · New Methods of Preparing (P. E. M. Allen, J. M. Downer, G. W. Hastings, Prof. H. W. Melville, P. Molyneux and J. R. Urwin), 910

Corbridge, Dr. D. E. · Semi- and Non-Crystalline Materials, 123
Corn : Two Ears of ; Two Blades of Grass (D. H Killeffer), *review* by Dr. R. E. Slade, 298
Corn in the American Economy (Agricultural Research Institute of the United States National Academy of Sciences Symposium on), 117
Cornea (Human) : *ABO* Antigens in the (Dr. E. Nelken, Prof I. C Michaelson, Dr. D. Nelken and Prof J. Gurevitch), 840
Cornell University (Department of Engineering Physics) : Summer Laboratory Course on Techniques and Applications of the Electron Microscope, 922
Cornell University Medical College Grant of 48,000 dollars from the Rockefeller Foundation, for research on latency or activation of viruses, 976
  Grant of 50,000 dollars from the Rockefeller Foundation, for research in biomathematics, 977
Corpuscles (Lipide (Sudan Black Positive)), in the Bovine Lens (Dr. A. J. Dark), 48
Corpuscular Precipitation : Spiral Patterning of Solar (E. R. Hope), 571
Correlation of Nuclear Quadrupole Interaction Frequencies with Polarographic Half-Wave Potentials (Dr. T. Iredale), 36
Correlation between Photons in Two Coherent Beams of Light (R. Hanbury Brown and R. Q. Twiss), 27
Correlation Patterns in the Chromospheric Granulation (J. T Jefferies and R. E. Loughhead), 180
Corrosion Surface Treatment for the Improvement of Mechanical Properties and Protection against (Sixth International Mechanical Engineering Congress), 922
Corrosion of Metals and its Prevention (Education Panel of the Corrosion Group of the Society of Chemical Industry Prize for an essay or paper on the), 17
Corrosion Prevention in Packaging and Storage (Corrosion Group and the Birmingham and Midland Section of the Society of Chemical Industry Symposium on), 511
Corrosion and Shell Composition in Barnacles (H. Barnes), 290
Corticotropin : Action of Ascorbic Acid on (M L. Dedman, T. H. Farmer and Prof C. J. O. Morris), 1082 ; (Dr. M Holzbauer), 1082
Cortina-Ulisse European Prize for 1956, 119
Cortisone . A Biological Factor inhibiting the Effect of, on Antibody Formation (Kaare Berglund and Astrid Fagraeus), 233
  Effect of, on the Blood (Prof. T. Nicol and D. L J. Bilbey), 524
  Effect of, on the Reticulo-Endothelial System (Prof. T. Nicol and R. S. Snell), 430
  Effect of, on the Serum Gamma-Globulin (R. S. Snell and Prof. T Nicol), 578
Cortisone in the Rat Influence of Thyroparathyroidectomy on the Hæmatological Changes induced by (M. P Brogi and Q. Maggiore), 138
Corynebacterium sp. (Soil) Potassium Ion Stimulation of Hydrocarbon Oxidation by a (J N. Ladd), 939
Cosmic Clouds Gas Dynamics of—a Symposium held at Cambridge, July 6–11, 1953 (edited by H C. van de Hulst and J. M. Burgers), *review* by Dr. F. D. Kahn, 352
Cosmic-Radiation Storm of February 23 Sudden Decrease in Low-frequency Atmospheric Noise during the (C. A. McKerrow), 1223

Cosmic-Ray Increase observed at High Southern Latitudes on February 23, 1956 (Dr. A. G. Fenton, K G. McCracken, N. R. Parsons and P. A. Trost), 1173
Cosmic Rays : Search for Point Source of (Y. Sekido, S. Yoshida and Y. Kamiya), 35
Cosmic Spherules in Deep-Sea Sediments (Kurt Fredriksson), 32
Cosslett, Dr. V. E. : Rapport Europées Congrès Toegepaste Electronenmicroscopie, *review*, 107
Cosslett, Dr. V. E., and Duncumb, P. · Microanalysis by a Flying-Spot X-Ray Method, 1172
Cotton : Effect of some White Pigments on the Actinic Degradation of (W. R. Hindson and P. G. Kelly), 1241
Cotton (Raw) : Properties and Distribution of (Manchester and District Section of the Textile Institute Discussion on), 73
Cotton Growing Problems (Prof. Basil G. Christidis and George J. Harrison), *review* by Dr. W. Lawrence Balls, 597
Cotty, W. F. : Diamond as a Pinpoint Radiation Counter, 1075
Coulson, Prof. C A : The Teaching of Chemical Principles in School and University, 72
Coulson, Dr. E. A. : *Obituary* of Dr. F. H. Burstall, 210
Council of Europe and the High Authority of the European Coal and Steel Community : Fellowships for research into problems of European interest, 263
Counter (Pinpoint Radiation) : Diamond as a (W. F. Cotty), 1075
Country Book : The Boys' (edited by John Moore), *review*, 300
Country Code (National Parks Commission), 1156
Countryside in Britain : Preservation of the, 245
Coupled Oxidation of Keto-Acids with Glutathione (D. Cavallini, G. F. Azzone and F. Stirpe), 1232
Coupled Techniques in Tracer Experiments : Electron Microscopy and Radioautography as (Dr. J. Liquier-Milward), 619
Course on Acoustics for Aeronautical Engineers (University of Southampton), 464
Course on the Applications of Radioactive Isotopes in Industry and their Uses as Tracers (College of Technology, Bristol, in collaboration with the Regional Council for Further Education for the South West), 1065
Course on the Design, Use and Maintenance of Electronic Instruments : Specialized (Atomic Energy Research Establishment), 922
Course on the Elements of Radiological Protection (Isotope School, Atomic Energy Research Establishment), 364
Course on First Steps in Industrial Film Making (Industrial Committee of the Scientific Film Association), 364
Course on the Magnetic Properties of Matter (Italian Physical Society), 1018
Course in Meteorology : Vacation (Field Studies Council and the Royal Meteorological Society), 922
Course in Nuclear Engineering : Autumn (Queen Mary College, London), 653
  Undergraduate (University of Glasgow), 508
Course on Oilfield Reservoir Engineering : Summer (University of Birmingham), 1065
Course on Techniques and Applications of the Electron Microscope · Summer Laboratory (Department of Engineering Physics, Cornell University), 922
Course on the Theory and Practice of Aerial Photogrammetry (French National School for Geographical Sciences), 831
Course on Tropical Hygiene for Laymen (Ross Institute), 922
Course on the Use of Statistics in Personnel Management (Institute of Personnel Management and the National Institute of Industrial Psychology), 779
Courses (Advanced), at Technical Colleges Awards for, 607
Courses (Advanced), in Technology (London and Home Counties Regional Advisory Council for Higher Technological Education, Booklet on), 364
Courses (Sandwich) : Development of (Ministry of Education and the British Association for Commercial and Industrial Education Conference on), 464
Courses (Sandwich Diploma), at Birmingham (Prof M. R. Gavin), 781
Courses and Awards in Technology, 920
Coursey, D. G. : Appointed scientific officer (chemist), Federation of Nigeria, 561
Couture, Mme. L. · Low-Temperature Crystallography, 1069
Covell, Sir Gordon : *Obituary* of Brigadier J. A. Sinton 826
Cow's Udder : A Radiographic Method for the Study of the Function of the (Dr. J. Bilek and Dr M. Janovsky), 582
Cowan, Prof. I. McT. : Appointed a member of the National Research Council of Canada, 830
Cowan, Dr. H. K. : Elected a Fellow of the Royal Society of Edinburgh, 506
Cowie, Dr. A. T. : The Neurohypophysis, 1020
Cowie, Dean B., and others . Studies of Biosynthesis in *Escherichia coli*, *review* by Dr. Kenneth McQuillen, 594

Differences between the Electrical Charge carried by Normal and Homologous Tumour Cells (Dr. E. J. Ambrose, A. M. James and J. H. B. Lowick), 576
Differences in Humidity : Variation in Mortality with, among Mosquitoes exposed to BHC, Dieldrin and DDT (G. F. Burnett), 663
Differences in Proportion of Fawns to Hinds in Red Deer (*Cervus elaphus*) from several New Zealand Environments (Thane Riney), 488
Differential Equations : Theory of Ordinary (Prof. Earl A. Coddington and Prof. Norman Levinson), *review*, 722
Diffraction from Dislocations (T. Suzuki and B. T. M. Willis), 712
Diffusion of Interlayer Water in Vermiculite (G. F. Walker), 239
Diffusion of a New Habit among Greenfinches (Max Pettersson), 709
Diffusion (Thermal) : Separation of Hydrocarbon Isomers by (Dr. C. J. Danby, J D. Lambert and C. M. Mitchell), 1225
Diffusion and related topics : Melting, (Low Temperature and Solid-State Physics Group of the Division of Pure Physics of the National Research Council of Canada Symposium on), 23
Digestion Technique . Gelatin Light-scattering, by a New Enzymic (Dr. G. Stainsby), 745
Digital Computer Techniques (Institution of Electrical Engineers Convention on), 1069
Digital Computers (Small) : Design and Application of (Proceedings of the Conference held by the Eastern Section of the Joint Computer Committee), 462
Digital Computing Machines (Automatic) : Programme Design for (Mathematical Laboratory of the University of Cambridge Summer School in), 922
β-Dihydroequilin and α-Dihydroequilenin from the Urine of Pregnant Mares : Isolation of (W. L. Glen, R. Barber, H. M McConkey and G. A. Grant), 753
Dihydrostreptomycin (Tritium-labelled) : Preparation of (Dr. Torsten André), 379
2-4-Dihydroxybenzoic Acid : Isosterism and Molecular Fourier Transform —Crystal Structure Determination of, as related to that of 2-Hydroxy-4-aminobenzoic Acid (Prof. G. Giacomello, Prof. A. M. Liquori and A. Ripamonti), 944
Dijksterhuis, E. J., and others (edited by) : The Principal Works of Simon-Stevin, Vol. I, General Introduction, Mechanics, *review* by Prof. E N. da C. Andrade, 3
Dikshit, P. K. (Joshi, J. G., and) . Effect of Vitamin D on the Phosphorus Content of Rachitic Rat Cartilage, 625
Dilemma of the Scientist (Dr. J. Bronowsk), 734
Dilogarithms and related Functions : Request for information of (L. Lewin), 1208
Dilute Solution . Modification of the Bulk Mechanical Properties of Water by Complex Formation in (T. Nash), 948
Dimensions of the Nuclei of Neurones ; Changes in the, with Activity (Dr. M R. A. Chance, A J. Lucas and Dr. J. A H. Waterhouse), 1081
Dimorphism of Polyglycine (Dr. A. B. Meggy and Dr. J. Sikorski), 326
Dimorphism in the Portuguese Man-of-War (A. K. Totton and G. O. Mackie), 290
Dinger, H. E. (Morgan, M G., and) : Observations of Whistling Atmospherics at Geomagnetically Conjugate Points, 29
Dingle, Prof. Herbert . Relativity and Space Travel, 782, 785
Dingwall, Dr. E. J. : Dictionary of Magic, *review*, 1053
Dingwall, Dr. E. J., and others : The Haunting of Borley Rectory, *review* by Prof. F. J. M. Stratton, 595
2 . 4-Dinitrophenyl-Derivatives of Aliphatic Amines : Paper Chromatographic Identification of the (I M. Lockhart), 393
Dinning, M. : Appointed senior assistant conservator of forests, Gold Coast, 1207
Dioscorea dumetorum : A Convulsant Alkaloid of (Prof. C. W. L. Bevan, Dr J. L. Broadbent and J Hirst), 935
Dioxide (Nitrogen) : Reaction between Formic Acid and (Dr. F. H. Pollard and K. A. Holbrook), 799
Diphosphate (Adenosine) : Enzymic Synthesis and Properties of a Polynucleotide from (Dr. Roland F. Beers, jun.), 790
Diphtheria Toxins : Tests of Purity of, by Electrophoresis in Starch Gel (M. D. Poulik), 982
Diploid *Saccharomyces cerevisiæ* (Haploid and) : Dominant Lethality induced by X-Rays in (M. E. Owen and R. K. Mortimer), 625
Diploma Courses (Sandwich), at Birmingham (Prof. M. R. Gavin), 781
Diprose, K. V. : Awarded the Simms Gold Medal of the Royal Aeronautical Society, 919
Direct Method for the Measurement of Cerebral Blood-flow (D. H. Ingvar and U. Soderberg), 339
Direction Indicators for Motor-Vehicles, 1016
Directly Reacting Form of Bilirubin in Serum : Di- and Mono-Taurobilirubin similar to a (Dr. M. Jirsa, B. Večerek and M. Ledvina), 895
Discharge Plasmas . The Langmuir Paradox in (Dr. H. Martin and Prof. K. G. Emeléus), 943
Discoloration of Muscle Preparations from Codling (*Gadus callarius*) by Degradation Products of I-Methylhistidine (Dr. N. R. Jones), 748
Discontinuous Respiration in Insects : Spiracular Control of (Dr. Howard A. Schneiderman), 1169
Discovery : Resignation of William E. Dick as editor, 311
  Appointment of Dr. Anthony Michaelis as editor, 311
Diseases of the Blood, with special reference to Leukæmia : Research on (Lady Tata Memorial Fund Grants, Scholarships or Fellowships for), 415, 1208
Dislocations : Diffraction from (T. Suzuki and B. T. M. Willis), 712
Disney, H. J. de S. (Marshall, Dr. A. J., and) : Photostimulation of an Equatorial Bird (*Quelea quelea*, Linnaeus), 143
Disordered Zinc Sulphide : Electroluminescence in (M. A. Short, E. G. Steward and T. B. Tomlinson), 240
Dispersing Agent for the Examination of Particulate Matter by Electron Microscopy and Electron Diffraction : Petroleum Ether (80°–100° C.) used as a (E H. Boult), 484
Disposal of Industrial Waste Materials (Society of Chemical Industry Conference on), 562
Dissolved Oxygen : Galvanic Measurement of (A. G. Dowson and I. J. Buckland), 712
Distances (Great) Propagation of Audio-Frequency Radio Waves to (Dr. F. W. Chapman and R C V. Macario), 930
Distribution of 8-Azaguanine in the Nucleic Acids of *Bacillus cereus* (Dr. R. E F Matthews and Dr J. D. Smith), 271
Distribution of Chromosome Number : Nucleic Acid Content and, in Original and Sublines of Two Mouse Ascites Tumours (Dr. John C. Colter, Harris H. Bird, Hilary Koprowski and Hilda B. Ritter), 993
Distribution of Physiological Races of *Phytophthora infestans* (Mont.) de Bary in Northern Ireland (D. A Doling), 230
Distribution of Raw Cotton Properties and (Manchester and District Section of the Textile Institute Discussion on), 73
Ditchburn, Prof R. W : An Intelligent Man's Guide to Theoretical Physics, *review*, 151
Ditchburn, Prof. R. W., and Pritchard, R. M. : Stabilized Interference Fringes on the Retina, 434
Dithiocarbamates and Xanthates : Electronic Structures of (Dr. J. Chatt, L. A Duncanson and L. M. Venanzi), 1042
Divalent Palladium and Platinum : Some New Stereochemical Arrangements of (Dr. C M. Harris, Prof. R. S. Nyholm and N. C. Stephenson), 1127
Dixon, Keith L : Ecological Analysis of the Interbreeding of Crested Titmice in Texas, 1213
Dlugosz, Dr. J. : Fibre Microscopy, 515
Dobbs, Dr. E. R : Low-Temperature Crystallography, 1069
Dobson, Ronald M , and Satchell, J. E : *Eophila oculata* at Verulamium—a Roman Earthworm Population', 796
Dobson, Sir Roy Honorary Fellowship of the Royal Aeronautical Society conferred on, 919
Documentation of Applied Chemistry : First International Congress on (International Union of Pure and Applied Chemistry), 168
Documentation of Science, 466
Dodgson. Dr. K. S., and others : Examples of Anti-competitive Inhibition, 432

Doery, Hazel M. : Purine Compounds in Snake Venoms, 381
Dog (Cystinuric Labrador) Amino-Acid Patterns of Urine and Blood Plasma in a (C. W. Crane and A. W. Turner), 237
Doling, D. A. Distribution of Physiological Races of *Phytophthora infestans* (Mont.)-de Bary in Northern Ireland, 230
Domains : Ferromagnetic (Dr. K. H. Stewart), *review*, 154
Domestic Animals . Responses of, to Infections of *Trypanosoma vivax*, *T. congolense* and *T. brucei* (Prof. E. E. Edwards, J. M. Judd and F. A. Squire), 332
Domestic Heating in Great Britain (Institute of Fuel Conference on), 414
Dominant Lethality induced by X-Rays in Haploid and Diploid *Saccharomyces cerevisiae* (M. E. Owen and R. K. Mortimer), 625
Donatelli, Prof. L. . Chemistry, Biochemistry and Pharmacology of Thioctic Acid, 75
Dony, Dr. J. G. : Progress in the Study of the British Flora, 1163
Dornberger-Schiff, Dr. K : Semi- and Non-Crystalline Materials, 122
Dose-rate : Irradiation of Thiourea—Effect of, upon the Chain Reaction (Dr. W. M. Dale), 531
Dose-rate in *Drosophila* Genetic Effects of X-Rays in relation to (Dr. A. M. Clark), 787
Doses of X-Rays : Effects of Single and Fractionated, on Mouse Embryos (Dr. Robert Auerbach), 574
Double Stars : The Need for Observations in the Older Branches of Astronomy, especially (Dr. J. Jackson), 975
Douglas, H A. : Appointed conservator of forests, Gold Coast, 1112
Douglas, Lewis W. : Use of Solar Energy, 111
Douglas, Prof R. W. : Semi- and Non-Crystalline Materials, 121
Douglas Fir in America and Great Britain Sitka Spruce and, 1207
Dover, Cedric : *Obituary* of Dr Sunder Lal Hora, 359
Dover : Currents Through the Straits of (Prof. K. F. Bowden), 881
Dovers, Robert : Awarded the Mrs Patrick Ness Award for 1956 of the Royal Geographical Society, 606
Dow, D. . Appointed assistant cacao propagation officer, Jamaica, 1208
Dowdeswell, W. H. . Detection and Development of Scientific Ability, 824
  The Mechanism of Evolution, *review* by Dr. Maurice Ashby, 864
Downer, J. M., and others : New Methods of Preparing Block Copolymers, 910
Downie, Dr. C., and Honeycombe, Prof. R. W K. : Examination of Fossil Coccoliths in the Electron Microscope, 947
Dowson, A. G., and Buckland, I. J. : Galvanic Measurement of Dissolved Oxygen, 712
Dragonflies of North America (Anisoptera) : A Manual of the (Prof. James G. Needham and Prof. Minter J. Westfall, Jr.), *review* by D. E. Kimmins, 450
Draper, A. . Properties and Distribution of Raw Cotton, 74
Draper Medal of the National Academy of Sciences, Washington, awarded to Prof. Hendrik C. van de Hulst, 924
Drayner, Jean M.: Regulation of Outbreeding in Field Beans (*Vicia faba*), 489
Dreams : The Interpretation of (Sigmund Freud), translated from the German and edited by James Strachey, *review* by Sir Cyril Burt, 495
Drieding, A. : Chemistry of Oxygenated Heterocyclic Compounds, 1116
Drennan, Prof. M. R. : Retirement from the chair of anatomy in the University of Cape Town, 873 ; work of, 873
Dresden, Dr. D. : Muscle Contraction in an Insect—A Technique for Recording Muscle Contractions in an Insect on a Kymograph, 935
Dresden, Dr. D. (Becht, G., and) : Muscle Contraction in an Insect—Physiology of the Locomotory Muscles in the Cockroach, 836
Drew, Dr. Kathleen M. : Phytoplankton of Lake Tanganyika, 520
Drops (Large) : Shattering of (R. H. Magarvey and B. W. Taylor), 745
Drosophila : Genetic Effects of X-Rays in relation to Dose-rate in (Dr. A. M. Clark), 787
  A Mutant of, without *Iso*xanthopterine which is Non-Autonomous for the Red Eye Pigments (Prof. Ernst Hadorn and Ilse Schwinck), 940
  Organic Peroxides and Mutagenic Effects in (Dr. F. H. Sobels), 979
Drosophila melanogaster : Mutagenicity of 2-Chloroethyl Methanesulphonate in (O. G Fahmy and Myrtle J. Fahmy), 996
  Reversal of Mating Preference by Crossing Strains of (G. Tebb and Dr. J. M. Thoday), 707
Drought (Prolonged) . Effect on Crop Growth of Rain after (P. C. Owen and Dr. D. J. Watson), 847
Drower, Lady Awarded a research grant by the Leverhulme Trustees, 918
Drucker, Peter F. : The Practice of Management, *review* by E. F. L. Brech, 104
Drugs : Tremor produced by (Dr. Guy M. Everett), 1238
Drugs and Chemicals : The Analysis of (Dr. Norman Evers and Wilfred Smith), *review* by J. R. Nicholls, 597
Drummond, Dr. D G. : Electron Microscopy of Fibres, 318
Drummond, Dr. D. G., and Ford, J. E. : Fibre Microscopy, 516
Dryden, Dr. Hugh L. : Honorary Fellowship of the Royal Aeronautical Society conferred on, 919
Drying from the Frozen State : Preservation of Animals and Plants by (Dr. D A. L. Davies and V S. G. Baugh), 657
Dryopteris : Morphogenetic Studies of (C. W. Wardlaw and E. G. Cutter), 217
DuBois, Dr. Eugene Floyd : Awarded the Medal of the New York Academy of Medicine, 261
DuBridge, Dr. Lee A. : Elected a member of the Board of Trustees of the Rockefeller Foundation, New York, 1018
Dubert, J. M. (Cinader, B., and) : Immunological Tolerance, 869
Dubiski, S., and others : Preparation of Antiglobulin Sera, 329
Duckworth, Dr. J : The Impact of Food Technology on the Nutrition of Man and Animals, 1200
Duckworth, J. C. (Pask, V. A , and) : The Place of Nuclear Energy in United Kingdom Power Development, 204
Duckworth, R. B. (Gooding, E. G. B., and) : Accelerated Storage Tests for Dehydrated Vegetables, 897
Duckworth, Dr. W. L. H *Obituary* by Prof. J. D Boyd, 505
Dudley, Dr N. A. : Appointed reader in engineering production and head of the Department of Engineering Production in the University of Birmingham, 876
Duff, D. C. : Appointed conservator of forests, Gold Coast, 1112
Duffie, Dr. John A. (edited by Daniels, Prof. Farrington, and) : Solar Energy Research, *review*, 1145
Dugdale, J. S. : Melting, Diffusion and related topics, 23
Duggie, D. M. Appointed senior assistant conservator of forests, Gold Coast, 1207
Duke, B. O. L. : Appointed medical research officer, grade I, West African Council for Medical Research, Western Region, Nigeria, 1207
Dullforce, Winifred M. : Growth of Lettuce Seedlings, 1244
Duncan, W. R. H., and others : Muscular Dystrophy of Beef Cattle and Unsaturated Fats, 792, *erratum*, 1208
Duncanson, L. A., and others : Electronic Structures of Dithiocarbamate and Xanthates, 1042
Duncumb, P. (Cosslett, Dr. V. E., and) : Microanalysis by a Flying-Spot X-Ray Method, 1172
Dungey, J. W. : Movements in the Ionosphere, 308
Dunlop Organization : Appointment of E. A. Murphy as director of research in charge of the central research division, 650
Dunlop Rubber Co., Ltd. : Scholarship in Agricultural Engineering (Institution of British Agricultural Engineers), 511
Dunn, F. P. : Documentation of Applied Chemistry, 169
Dunne, Agnes C. (Clark, F Le Gros, and) : Ageing in Industry, *review* by Prof. John Cohen, 449
Dura Den : A Gigantic *Holoptychius* from (John Attridge), 232
Duration of Action of the Cardiac Glycosides : A Method for Determining the (M. Rand and Anne Stafford), 278
Durran, P. : Appointed veterinary officer, Northern Region, Nigeria, 1112
Durrum, Emmett L., and others : A Manual of Paper Chromatography and Paper Electrophoresis, *review* by Dr. R. Consden, 300
Dust (Atmospheric) . Detection of, and Temperature Inversions by Twilight Scattering (Dr E. K. Bigg), 77
Dutta, Prof A. K., and others : Viscosity of Liquids and Ultrasonic Studies, 1227
Dutton, Walter C. Elected president of the Agricultural Research Institute of the United States National Academy of Sciences, 117
Dyer (Bernard) Memorial Lecture of the Society for Analytical Chemistry (Sir William Slater), 651
Dyers and Colourists, Society of (Huddersfield Section) : Exhibition at the Huddersfield Technical College to commemorate the centenary of the discovery of mauveine by W. H. Perkin, 464
Dyers and Colourists, Society of, and others : Perkin Centenary Celebrations, 1009
Dyes and Pigments : The Chemistry of Synthetic (edited by H. A. Lubs), *review* by Dr. S. Coffey, 498
Dyestuffs Chemistry, *review* by Dr. S Coffey, 498
Dyestuffs Industry : Development of the (Clifford Paine), 1009
Dyestuffs Industry in Britain . Perkin and the (R. Brightman), 815
Dynamic Stress-Strain Relationship of Bonded Rubber in Compression : Effect of Shape on the Static and (A. R Payne), 1174
Dynamics and Quantum Theory : Variational Principles in (Dr. Wolfgang Yourgrau and Stanley Madelstam), *review*, 1053
Dynamics (Gas), of Cosmic Clouds—a Symposium held at Cambridge, July 6–11, 1953 (edited by H C. van de Hulst and J. M. Burgers), *review* by Dr. F. D. Kahn, 352
Dyson, Prof. Freeman J. : *Obituary* of Prof. Hermann Weyl, 457
Dyson, Ltd., J. and J. : Gift of £15,000 to the University of Sheffield for the establishment of a chair in refractories technology, 650
Dystrophy (Muscular), of Beef Cattle and Unsaturated Fats (Dr. G. A. Garton, W. R. H. Duncan, K. L. Blaxter, R. F. McGill, G. A. M. Sharman and M K. Hutcheson), 792, *erratum*, 1208

E (REGION), and the *Sq* Current System (Dr. W. J. G. Beynon and G. M. Brown), 583
Eady, E. T. Movements in the Ionosphere, 308
Early History of the Survey of India, *review* by Brigadier G. F. Heaney, 444
Early Tertiary Times : Schizaeaceae of the South of England in (Marjorie E. J. Chandler), 463
Earth : Kelvin on the Origin of the (D. W. Allan), 801 ; (T. Gold), 802
  The Thermal History of the (Prof. J A. Jacobs and D. W. Allan), 155
Earth Tremor of January 10 : The Derbyshire, 165
Earth's Free Nutation : Damping of the (Prof. B. Gutenberg), 887
Earth's Surface : Heat Convection from the (C. H. B. Priestley), 435
Earthquakes during August 1955–January 1956, 462 ; during February, 608
Earthquakes in Lebanon : Recent, 560
Earthworm Population ? : *Eophila oculata* at Verulamium—a Roman (Ronald M. Dobson and J E. Satchell), 796
Earthworms : Australian (Elizabeth C. Pope), 875
  Green (Smithsonian Institution News Release), 214
Earwicker, G. A. : Electrical Equipment of Aircraft, 1211
East (Middle) : Old Akkadian Tablets from the (Prof Ignace J Gelb), 735
East Africa : Zoonoses in (East African Medical Research Scientific Advisory Committee Conference on), 406 ; (Dr. K. C. Willett), 948
East Africa High Commission: Appointment of D. L. Johns as senior scientific officer, East African Tsetse and Trypanosomiasis Research and Reclamation Organization, 70
  Appointment of M J Cawcerry-Hope as scientific officer, East African Tsetse and Trypanosomiasis Research and Reclamation Organization, 70
  Appointment of G. A. H. McClelland as scientific officer, East African Veterinary Research Organization, 70
  Annual Report for 1954–55 of the East African Agricultural and Fisheries Research Council, 509
  Appointment of D. W. Brocklesby as veterinary research officer (protozoologist), 561
  Appointment of J Brazell as director of the East African Meteorological Department, 831
  Appointment of J. F. McCloy as senior scientific officer, East African Industrial Research Organization, 831
  Annual Report for 1954–55 of the East African Industrial Research Organization, 881
  Appointment of M. Dagg as scientific officer, 1112
  Appointment of Miss S. J. Clarke as medical research officer, grade III, 1112
East African Agricultural and Fisheries Research Council : Annual Report for 1954–55, 509

East African Industrial Research Organization : Appointment of J. F. McCloy as senior scientific officer, 831
  Annual Report for 1954–55, 881
East African Medical Research Scientific Advisory Committee : Annual Scientific Conference (Zoonoses in East Africa), 406
East African Meteorological Department . Appointment of J. Brazell as director, 831
East African Mosquitoes : Rhythmic Biting Activity of certain (Dr. A. J. Haddow), 531
East African Tsetse and Trypanosomiasis Research and Reclamation Organization Appointment of D. L Johns as senior scientific officer, 70
  Appointment of M J. Cawderry-Hope as scientific officer, 70
East African Veterinary Research Organization : Appointment of G. A. H. McClelland as scientific officer, 70
Eastern and North-Eastern Africa : Birds of (C. W Mackworth-Praed and C H. B. Grant), *review* by Sir Landsborough Thomson, 203
Eastman Kodak Company : Retirement of Dr. C. E. K. Mees as vice-president in charge of research, 360
  Appointment of Dr. C. J Staud as vice-president in charge of research and development, 360
Eastwood, F. W. · Elected a Salter's Fellow for 1956–57 by the Salters' Company, 1113
Eccles, Sir David : To open the extensions to Northampton Polytechnic, London, 736
Eccles, J. : Nuclear Energy, 205
Ecdysis (Second), of Nematode Larvæ parasitic in the Horse · Effect of a Coliform Organism (*Escherichia*) on the (D Poynter), 481
École National des Sciences géographiques . Course on the Theory and Practice of Aerial Photogrammetry, 831
Ecological Analysis of the Interbreeding of Crested Titmice in Texas (Keith L. Dixon), 1213
Ecology of *Anopheles gambiae* Giles (James G Halcrow), 1103
Ecology of the Higher Fungi (Symposium in the University of Liège), 1159
Economic Association, International (International Sociological Association and the) : Symposium on the Positive Contribution by Immigrants, 1164
Economic Developments (Technical and) · World Energy Resources in the Light of Recent (Fifth World Power Conference), 692
Economy (American) : Corn in the (Agricultural Research Institute of the United States National Academy of Sciences Symposium on), 117
Ectoderm of *Fundulus heteroclitus* : Factors influencing the Transport of Sea Water Cations across the (D. R. Shanklin), 431
Ectoderm (Bovine Amniotic) : Growth of, as a Cell Monolayer on Glass and its Use as a System for Virus Multiplication (T. W. F. Pay), 752
Ectodermal Ridge of the Tail in Mouse Embryos . A Ventral (Prof. Hans Gruneberg), 787
Ectotrophic Mycorrhiza in Renantherous Species of *Eucalyptus* (L. D. Pryor), 587
Edels, Dr. H. (Gambling, W. A., and) · Formation of the High-Pressure Arc Column in Hydrogen, 1090
Edels, Dr. H. (Whittaker, D., and) · Determination of Arc Temperatures using Shock Waves, 484
Edgar, Janice, and others · Mode of Action of *Iso*nicotinic Hydrazide, 480
Edge, Colonel R. C. A. · New Determinations of the Velocity of Light, 618
Edinburgh Geological Society : Grants from the Clough Memorial Research Fund for Geological Research in Scotland and the north of England, 415
Edman, Pehr : Mechanism of the Phenyl *Iso*thiocyanate Degradation of Peptides, 667
Edmunds, W. T., and Lloyd, R. C. : Given a Capper Pass Award for 1955 by the Institution of Mining and Metallurgy and the Institute of Metals, 363
Edsall, John T., and others (edited by) : Advances in Protein Chemistry, Vol. 9, *review* by Prof. J. A V. Butler, 295
Education Ancient (Prof. William A. Smith), *review* by A. C F. Beales, 296
  The Balance of Arts and Sciences in, 1095
  The Origins of, *review* by A. C. F. Beales, 296
  Science and (Sir Edward Salisbury), 170
  Technical—its Aims, Organisation and Future Development (Dr. P. F. R. Venables), *review* by Hugh A. Warren, 296
  Technical—Shortage of Scientists, Technologists and Technicians (John Wellens), 967
  Technology as a branch of (Prof. C. W. Dannatt), 1015
Education : 'That Science can Provide as Good an, as the Humanities' (Fine Chemicals Group of the Society of Chemical Industry Debate on the Motion), 562, 960
Education, International Review of, 372
Education, Ministry of : Report of the Committee on Maladjusted Children, 973
Education, Ministry of, and the British Association for Commercial and Industrial Education : Conference on the Development of Sandwich Courses, 464
Education through Physics (Prof F A. Vick), 1158
Education of the Adolescent, 149
Education of Good Men (M. L. Jacks), 150
Education and the Rhodes Trust, 347
Education (Commercial and Industrial), British Association for (Ministry of Education and the) · Conference on the Development of Sandwich Courses, 464
Education (Further), Northern Advisory Council for : Eighth Annual Report, 1112
Education (Health), in the U.S.S.R. (Dr. John Burton), 1111
Education (Higher), in the United States, 1158
Education (Higher), Overseas . Inter-University Council for (1946–1954), 405
Education (Higher Technical), in Britain, 903
Education (Higher Technological), London and Home Counties Regional Advisory Council for : Booklet on Advanced Courses in Technology, 364
  Seventh Annual Report, 691
Education (Liberal) : The Place of Meteorology in (Royal Meteorological Society Prize for an essay on), 415
Education (Mathematical), in South Asia : International Conference on, 694
Education (Medical), in the United States . Grants for (Commonwealth Fund, New York), 1064
Education (Medical), and Public Health : Fellowships in (Rockefeller Foundation Awards), 977
Education (Scientific), in Schools : Industrial Fund for the Advancement of, 733
Education (Technical) . Developments in, *review* by Hugh A. Warren, 296
Education (Technical), in Britain, 461, 591, 651

Egg Nucleus of *Aloe davyana* in South Africa : Deoxyribonucleic Acid Deficiency in the Mature (Dr. S. Krupko and A. Denley), 92
Egg Phospholipids : Composition of (Dr. D. N Rhodes and Dr. C. H Lea), 1129
Egg Production of Hens : Control of Seasonal Variation in the (J. C. D Hutchinson), 795
Egg Transplantations (Reciprocal), to Study the Embryo-Uterine Relationship in Heat-induced Failure of Pregnancy in Rabbits (Dr. M. K. Shah), 1134
Eggs from Immature Mice treated with Gonadotrophins · Viability and Developmental Capacity of (Allen H Gates), 754
Eggs of *Lestinogomphus africanus* (Fraser), (R. Moylan Gambles), 663
Eggs (Mouse), fertilized with Labelled Sperm : Labelled Pronuclei in (R. G. Edwards and J L Sirlin), 429
Ehrlich, Dr. Gert, and Hickmott, Dr T W. Adsorption Spectrum of Nitrogen on Tungsten, 1045
Ehrlich Ascites Carcinoma Cells : Immunological Studies with Protein Fractions isolated from (Dr. John S Colter, Hilary Koprowski, Harris H. Bird and Kathryn Pfeister), 994
Eighteenth Centuries (Seventeenth and) . Evolution of a Scientific View of the Universe in the Physics of the (B. G. Kuznetsov), (in Russian), *review* by Dr. R. Eisenschitz, 1194
Eisenschitz, Dr. R. : Evolution of a Scientific View of the Universe in the Physics of the Seventeenth and Eighteenth Centuries, *review*, 1194
Elarosi, Hussein M. : Sporulation of Fungi inside the Plant Host Cell, 665
Elastic Properties of Cadmium Dependence of, on Temperature (S. V. Subrahmanyam), 852
Elder, Joseph Denison (Bluh, Dr. Otto, in collaboration with) . Principles and Applications of Physics, *review* by G R. Noakes, 1051
Electric Fencing against Game, 166
Electric Shock and Cardiazol Shock : Effect of, on Morphine Tolerance (Y Kasé), 1136
Electric Traction Engineering (E. A Binney), *review* by G H Platt, 401
Electric-breakdown Tracks in 'Perspex' (W. P. Baker), 886
Electrical Activity in the Cockroach Cerebrum (Donald M. Maynard), 529
Electrical Charge carried by Normal and Homologous Tumour Cells : Differences between the (Dr. E. J. Ambrose, A. M. James and J. H. B. Lowick), 576
Electrical Engineering : Mechanical and (compiled by G. F. Westcott), (Science Museum, Classified Lists of Historical Events, 1), 830
Electrical Engineers, Institution of · Election of Sir Stanley Angwin as an Honorary Member, 261
  Faraday Medal awarded to Prof George W. O. Howe, 261
  Thermionic Valves, 1904–1954, the First Fifty Years, *review* by R. L S -R., 499
  Convention on Digital Computer Techniques. 1069
  Convention on Electrical Equipment of Aircraft, 1210
Electrical Equipment of Aircraft (Institution of Electrical Engineers Convention on), 1210
Electrical Research Association · Grant of £900 to the Department of Electrical Engineering of the University of Birmingham, for the continuation of research work on electric discharges in liquids, 693
Electrical Responses of certain Lepidopterous Tympanal Organs (Dr. P. T. Haskell and P Belton), 139
Electrical Supply Systems in the United States, *review* by G. H. Platt, 297
Electrical Transmission and Distribution (edited by Bernhardt G. A. Skrotzki), *review* by G. H Platt, 297
Électriciens, Société Belge des, and others . International Conference on Analogy Computation, 20
Electricity : The Generation of, by Wind Power (E W. Golding), *review* by Dr. C. W. Marshall, 1050
Electricity, Direct and Alternating Current (Prof. Charles S. Siskind), second edition, *review* by W. Fraser, 1101
Electricity Supply Industry: Report of the Committee of Inquiry into the, 541
  Research and Development in the, 541
Electrification for British Railways : New System of (G. H. Platt), 867
Electrochemistry of Stainless Steel in Sulphuric Acid (Dr. G. H. Cartledge), 181
Electroluminescence in Disordered Zinc Sulphide (M. A. Short, E. G. Steward and T. B. Tomlinson), 240
Electrolytes in Solution . Polymers, Biocolloids and (Commission on Macromolecules of the International Union of Pure and Applied Chemistry and the Weizmann Institute of Science International Symposium on Macromolecular Chemistry), 562, 1161
Electrolytic Desalting : Destruction of Thyroxine by (Dr. J. B. Jepson and Dr. I. Smith), 84

Electrolytic Desalting with Ion-Exchange Membranes (Dr. J. D. Blainey and H. J. Yardley), 83
Electromagnetic Phenomena of Natural Origin in the 1·0–150 c./s. Band (Dr. Philip A Goldberg), 1219
Electromagnetic Signals : Low Audiofrequency, of Natural Origin (R. E. Holzer and O E. Deal), 536
Electromagnetically Enriched Isotopes : Production and Utilization of (Atomic Energy Research Establishment Conference on), 157
Electron Diffraction · Petroleum Ether (80°–100° C.) used as a Dispersing-Agent for the Examination of Particulate Matter by Electron Microscopy and (E. H Boult), 484
Electron Microscope . Examination of Fossil Coccoliths in the (Dr. C. Downie and Prof. R. W K. Honeycombe), 947
  The Golgi Apparatus and the (Prof J. Bronte Gatenby and R. G. Lutfy), 1027
  Techniques and Applications of the (Department of Engineering Physics of Cornell University Summer Laboratory Course on), 922
Electron Microscopic Observations on the Secondary Wall of the Protoxylem of *Cucurbita* (C. E. L. Hepton, Prof. R D. Preston and G. W. Ripley), 660
Electron Microscopical Study of the Histochemical Localization of Alkaline Phosphatase in the Cell Wall of *Chlorella vulgaris* (Dr. D. Brandes and Dr. R. N. Elston), 274
Electron Microscopy : Fine Structure of the Insect Retinula as revealed by (Dr. Humberto Fernández-Moran), 742
  Histochemical Techniques for—Alkaline Phosphatase (Dr. D. Brandes, H Zetterqvist and H. Sheldon), 382
  Use of Gold Sols as an Aid to Focusing in High-Resolution (T. H Flewett and Pamela Tymms), 98
Electron Microscopy of Fibres (Electron Microscopy Group of the Institute of Physics Conference on), 318
Electron Microscopy and Electron Diffraction · Petroleum Ether (80°–100° C) used as a Dispersing Agent for the Examination of Particulate Matter by (E. H. Boult), 484
Electron Microscopy and Radioautography as Coupled Techniques in Tracer Experiments (Dr. J Liquier-Milward), 619
Electron Multiplier · The Gas-Multiplier, a New Type of (C. H. Vincent), 391, *erratum*, 415
Electronenmicroscopie Rapport Europées Congrès Toegepaste, Gent, 7–10 April 1954 (edited by G. Vandermeerssche), *review* by Dr. V. E. Cosslett, 107
Electronic Computers in Molecular Quantum Mechanics, 362
Electronic Instruments : Design, Use and Maintenance of (Atomic Energy Research Establishment Specialized Course on), 922
Electronic Recording Machine for Financial Accounting, 510
Electronic Structures of Dithiocarbamates and Xanthates (Dr. J. Chatt, L. A Duncanson and L. M. Venanzi), 1042
Electronic Theory of Valency . An Introduction to the (Dr. J. C. Speakman), third edition, *review* by G. Fowles, 909
Electronics (Dr. J Thomson), *review* by C. R. Stoner, 1192
Electrons and Industry : Atoms, (Electronics Section of the Scientific Instrument Manufacturers' Association Exhibition on), 736
Electrophoresis of Complex Systems in Rapid Reversible Equilibrium : Boundary Problems in the Sedimentation and (Dr. G A. Gilbert and R C. Ll Jenkins), 853
Electrophoresis in Starch Gel : Tests of Purity of Diphtheria Toxins by (M. D. Poulik), 982
Electrophoresis (Paper) : Control of the Staining Procedure after (Dr. Ch. Wunderly), 586
  A Manual of Paper Chromatography and (Richard J. Block, Emmett L. Durrum and Gunter Zweig), *review* by Dr. R Consden, 300
Electrophoresis (Two-Dimensional), of Serum Proteins (Dr. O. Smithies and M. D. Poulik), 1033
Electrophoresis (Two-Dimensional Zone) · A Modified Method of, applied to Mucoproteins in Serum and Urine (R. L. Markham), 125
Electrostatics A New Theorem in, and its Application to Calculable Standards of Capacitance (A. M. Thompson and Dr. D. G. Lampard), 888
Ellagic Acid · Chromatographic and Spectroscopic Properties of, and its Occurrence in Dicotyledonous Plants (Dr. D. E Hathway), 747
Ellenby, Dr C. . Arresting *Paramecium*, 98
Ellingham, Dr. H J. T · The Presentation of Science to the Public, 1066
Elliot Medal of the National Academy of Sciences, Washington, awarded to Prof Archie Carr, 924
Elliott, Dr D. F., and Peart, Dr. W. S. Amino-Acid Sequence in a Hypertensin, 527
Elliott, K. A C , and others (edited by) Neurochemistry, *review* by Prof. J. N. Davidson, 811
Elliott, R., and Ramakrishna, V. : Insecticide Resistance in *Anopheles gambiae* Giles, 532
Ellis, Dr Drummond, and others . Reticulocyte Enzymes and Protein Synthesis, 190
Ellison, Dr M. A : The Sun and its Influence, *review* by Dr A Hunter, 1008
Ellison, Dr. T H. Turbulence in the Atmosphere, 14
Elrick, Dr H. : Glucagon and the Regulation of Carbohydrate Metabolism, 892
Elsevier's Dictionary of Television, Radar and Antennas in Six Languages (compiled and arranged on an English alphabetical base by W. E. Clason), *review* by Dr. R L. Smith-Rose, 1099
Elston, Dr. R. N (Brandes, Dr D., and) An Electron Microscopical Study of the Histochemical Localization of Alkaline Phosphatase in the Cell Wall of *Chlorella vulgaris*, 274
Eltenton, G. C. Automatic Control in the Process Industries, 254
Elton, Lord (edited by) : The First Fifty Years of the Rhodes Trust and the Rhodes Scholarships, 1903–1953, 347
Elvidge, Dr. J. A. : Recent Advances in the Chemistry of Colouring Matters, 645
Embryo-Uterine Relationship in Heat-induced Failure of Pregnancy in Rabbits Reciprocal Egg Transplantations to study the (Dr M. K. Shah), 1134
Embryology · Principles of (Prof. C. H Waddington), *review* by Dr. Julian Huxley, 807
Embryology, International Institute of · Congress on Developmental Biology, 1018
Embryology, Epigenetics and Biogenetics (Dr. William P. D. Wightman), 1240 ; (Prof. C. H. Waddington), 1241
Embryos (Early Human) : Determination of Sex in (Dr. T. W. Glenister), 1135
Embryos (Mouse) : Effects of Single and Fractionated Doses of X-Rays on (Dr Robert Auerbach) 574
  A Ventral Ectodermal Ridge of the Tail in (Prof Hans Gruneberg), 787
Emeléus, Prof. K G. (Martin, Dr. H., and) : The Langmuir Paradox in Discharge Plasmas, 943
Emerton, H. W. . Electron Microscopy of Fibres, 319
  Fibre Microscopy, 515
Emission of Photo Radiations by the Impact of Positive Ions of Helium on Nickel (Prof. Rafi M Chaudhri, Mustafa Yar Khan and Abdul Latif Taseer), 1226
Emission Nebula, *NGC* 6357 : Absorption of 3·5-m. Radiation in the Optical (B. Y Mills, A. G. Little and K V. Sheridan), 178
Emlen, jun , John T. (Strecker, R. L., and) : Populations of House-Mice, 692
Emmett, Paul H. (edited by) : Catalysis, Vol. 3, Hydrogenation and Dehydrogenation, *review* by Dr. E. B. Maxted, 765
Emotions · Language of the, *review* by Prof. John Cohen, 247
Emotions in Man and Animals The Expression of the (Charles Darwin), *review* by Prof John Cohen, 247
Empirical Relationship between the Excitation Energy of the *F*-band and Physical Constants for Alkali Halides (M Levy), 241
Employment Statistics for Recent British Graduates, 569
Emulsion Polymerization (Franz A. Bovey, I. M Kolthoff, A. E Medalia and E J. Meehan), *review* by Prof G. Gee, 297
Encephalomyelitis (Experimental Allergic), produced by Tubercle Bacillus Residues (J Colover and Dr. R. Consden), 749
Encyclopedia of Chemical Technology (edited by Raymond E. Kirk and Donald F Othmer), Vol. 11, Polyols to Rutin , Vol. 12, Sabadine to Stilbestrol , Vol. 13, Stilbite to Thermochemistry ; Vol. 14, Thermodynamics to Waterproofing, *review* by Sir Alfred Egerton 861
Endeavour Prize Essays for 1956 of the British Association for the Advancement of Science, 562
Endogenous Metabolism · 3-Hydroxyanthranilic Acid, a Carcinogen produced by (Prof. E. Boyland and G Watson), 837
Endosperm : Spontaneous Chromosome Breakage in (Dr. A. Rutishauser and L. F. La Cour), 324
Endostyle of *Ciona intestinalis* Organic Binding of Iodine in the (Prof. E J. W. Barrington and L. L. Franchi), 432
Endotrophic Mycorrhiza : Identification of an (B Mosse), 1207
Energy from the Winds : Power and, *review* by Dr. C. W. Marshall, 1050
Energy Resources (World), in the Light of Recent Technical and Economic Developments (Fifth World Power Conference), 692
Enforced Hibernation : Failure of, to Inhibit Breeding in the Frog (*Rana temporaria*), (Dr. Rhoda M. Allison), 342
Engel, E. Documentation of Applied Chemistry, 168
Engineer, The : Centenary of (W. J. Priest), 10
  Centenary issue of, 16
Engineering : Electric Traction (E. A. Binney), *review* by G. H. Platt, 401
  Mechanical and Electrical (compiled by G. F. Westcott), (Science Museum, Classified Lists of Historical Events, 1), 830
  Use of Logarithmic Notation in Science and (Prof. S. Devons), 373
Engineering (Aeronautical), at Belfast, 507
Engineering (Agricultural) : Scholarships in (Institution of British Agricultural Engineers), 511
Engineering (Human) · Anthropometry and—a Symposium on Anthropometry, Human Engineering and Related Subjects conducted by the AGARD Aeromedical Panel on May 3–4, 1954, in Scheveningen, The Netherlands, *review* by Wing-Comdr. F. Latham, 350
Engineering, (Nuclear), Vol. 1, No. 1, 829
Engineering (Nuclear) : Autumn Course in (Queen Mary College, London), 653
  Undergraduate Course in (University of Glasgow), 508
Engineering (Oilfield Reservoir) Summer Course on (University of Birmingham), 1065
Engineering Cybernetics (H. S Tsien), *review* by Dr. Colin Cherry, 351
Engineering Graduates (Science and) : Shortage of, in British Industry (Federation of British Industries), 312
Engineering Industry · Report on the Recruitment of Scientists and Engineers by the (Committee on Scientific Manpower of the Advisory Council on Scientific Policy), 51
Engineering Materials The Testing and Inspection of (Prof. Harmer E. Davis, Prof George Earl Troxell and Prof. Clement T. Wiskocil), second edition, *review* by K J Pascoe, 248
Engineering Monographs (B B C), 519
Engineering Research in the Imperial College, London, 570
Engineering Structures Plastic Theory of—Symposium in Cambridge, 1208
Engineering and Science Sonics—Techniques for the Use of Sound and Ultrasound in (Theodor F Hueter and Prof Richard H. Bolt), *review* by Dr. H. D Parbrook, 4
Engineers : Report on the Recruitment of Scientists and, by the Engineering Industry (Committee on Scientific Manpower of the Advisory Council on Scientific Policy), 51
  Training B B.C , 1110
  United States National Committee for the Development of Scientists and, 734
Engineers (Aeronautical) : Acoustics for (Course on, at the University of Southampton), 464
Engines . Automobile Free-Piston (F D Robinson), 914
England . Grants for Geological Research in Scotland and the north of (Clough Memorial Research Fund of the Edinburgh Geological Society), 415
  New Nature Reserves in (Nature Conservancy), 611
England (Saxon) : Sheep Farming in (Dr. W. G. Hoskins), 1071
England (South of) . Schizaeaceae of the, in Early Tertiary Times (Marjorie E. J Chandler), 463
England (South-West of) . Geological and Geomorphological Research in the (University of Exeter Conference on), 166
England and Wales for the Year 1952 · Text Volume of the Registrar General's Statistical Review of (General Register Office), 313

English Channel : Factors Affecting the Vernal Phytoplankton Outburst in the (Dr. W R. G. Atkins and Pamela G. Jenkins), 1218
English Rural Life, Museum of (Reading) : First Annual Report, 1156
English Voyages to North America under the Patent granted to Walter Raleigh in 1584 . The Roanoke Voyages, 1584–1590—Documents to illustrate the (edited by Prof. David Beers Quinn), *review* by Prof. Arthur Davies, 544
English Waters · Occurrence of *Achtheres percarum* Nordmann in (J. P. Harding and the late F. W K. Gervers), 664
Engravings (Rock Paintings and), in Hyderabad (Colonel D. H. Gordon and Dr. F R. Allchin), 1063
Enhanced Initiating Effect of Multiple Shock Intersections (Dr. C. H. Winning), 33
Enriched Isotopes : Production and Utilization of Electromagnetically (Atomic Energy Research Establishment Conference on), 157
Enrichment of Heavy Water by a Biological Method (L. Carlbom, R. Skjoldebrand and N. Nielsen), 988
Entomological Expedition to the Himalayas : The Second (Prof. M. S. Mani), 124
Entomology : Tenth International Congress of, 876
Entwisle, Dr. A. R. : Mechanism of Phase Transformations in Metals, 420
Environment : Effect of, upon the Growth and Development of Raspberry Canes (I. H. Williams and Dr. J. P. Hudson), 798
Environment in the Aerobic Oxidation of Unsaturated Fatty Acids : Metal Ion Catalysis and Polarity of (Dr. N. Uri), 1177
Environmental Factors influencing Gonadotrophin Assay in the Rat (Dr. M. R. A. Chance), 228
Environmental Factors affecting Hairiness in Mosquito Larvæ (Donald H. Colless), 229
Environments (New Zealand) Differences in Proportion of Fawns to Hinds in Red Deer (*Cervus elaphus*) from several (Thane Riney), 488
Enzymatic Identification of the Anthocyanin Pigment of Blackberry (Dr. H. T. Huang), 39
Enzyme . Synthesis of β-Galactosidase in *Ophiostoma multiannulatum* and some Properties of the (Dr. B. v. Hofsten), 844
Enzyme reducing Pyrroline-5-Carboxylate to Proline : Characterization of an (Marion E. Smith and Prof. David M. Greenberg), 1130
Enzyme (Autolytic), of *Bacillus subtilis* : Action of an, on the Cell Wall (Masayasu Nomura and Junko Hosoda), 1037
Enzyme (A New) . Aminomalonic Acid Decarboxylase— (Kensuka Shimura, Hideo Nagayama and Aiko Kikuchi), 935
Enzyme Action The 'Chain Effect', a Possible Analogue of (Dr. D. G. H. Ballard and Dr. C. H Bamford), 477
Enzyme Induction in Resting Yeast : Incorporation of Adenine and Uracil into Ribonucleic Acid during (Prof. H. Chantrenne), 579
Enzyme System (Dextran-Dextrinase) : Effect of Streptomycin on *Acetobacter capsulatum* and its Associated (Dr. B. H. Arnold and Dr. A. N. Hall), 44
Enzyme-activated Nitrogen Mustards : Selectivity of (P. Hebborn and Prof. J. F. Danielli), 25
Enzymes . Preparing, *review* by Dr. J. R. Turvey, 810
Enzymes (Metallo-) : Models for (Dr. R J P. Williams), 304
Enzymes (Pectic), secreted by *Pusarium moniliforme* : Production and Properties of the (R K. Singh and R. K. S. Wood), 738
Enzymes (Pectolytic) : Production of, by *Pythium de baryanum* (S. C. Gupta), 739
Enzymes (Reticulocyte), and Protein Synthesis (Dr. Drummond Ellis, C. Elizabeth Sewell and L. G. Skinner), 190
Enzymic Digestion Technique : Gelatin Light-scattering, by a New (Dr G. Stainsby), 745
Enzymic Formation of Pyrrolidone Carboxylic Acid from γ-Glutamyl Peptides (George E. Connell and Prof. Charles S. Hanes), 377
Enzymic Synthesis and Properties of a Polynucleotide from Adenosine Diphosphate (Dr Roland F. Beers, jun.), 790
Enzymology Methods in (edited by Sidney P. Colowick and Nathan O. Kaplan), Vol. I, Preparation and Assay of Enzymes, *review* by Dr. J. R. Turvey, 810
Eophila oculata at Verulamium—a Roman Earthworm Population ? (Ronald M. Dobson and J. E. Satchell), 796
Eotvos Constant : Thermodynamic Interpretation of the (Prof. Santi R. Palit), 1180
Ephedra Type · Pollen Grains of the, in Australian Tertiary Deposits (Dr. Isabel C Cookson), 47
Ephrussi, Prof. Boris, and others : Cytoplasmic Structures in Yeasts, 1041
Epidermis from Dermis : Separation of, by Filtrates of *Trichophyton mentagrophytes* (Dr. C. N. D. Cruickshank and M D. Trotter), 1085
Epigenetics, *review* by Dr. Julian Huxley, 807
Epigenetics and Biogenetics : Embryology, (Dr. William P. D. Wightman), 1240 ; (Prof. C. H. Waddington), 1241
d'Epistémologie génétique, Centre International : Establishment of the, 829
Epoxide Resins, their Chemistry and Structure in relation to their Properties and Applications (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 962
Eppelsheimer, Prof D S , and Gould, D S. : Deformation Characteristics of Hafnium, 241
Equations (Ordinary Differential) : Theory of (Prof. Earl A. Coddington and Prof. Norman Levinson), *review*, 722
Equatorial Bird (*Quelea quelea*, Linnaeus) : Photostimulation of an (Dr. A. J. Marshall and H. J de S. Disney), 143
Equilibrium (Rapid Reversible) : Boundary Problems in the Sedimentation and Electrophoresis of Complex Systems in (Dr. G. A Gilbert and R. C. Ll. Jenkins), 853
Erdtman, H. : Chemistry of Oxygenated Heterocyclic Compounds, 1117
Ergonomics Research Society : Symposium on Human Factors in Road Transport, 314
Ergot Fungus (*Claviceps purpurea* Tul.) : Role of Ergothioneine and Catalase in Infection by (A. St Garay), 91
Ergothioneine and Catalase : Role of, in Infection by Ergot Fungus (*Claviceps purpurea* Tul.), (A. St. Garay), 91
Ernest, W. : Awarded an Ablett Prize for 1955 of the Iron and Steel Institute, 919
Erosion in Meanders (Sir Claude Inglis), 394 ; (J. H. Horlock), 394
Erythrocyte Sedimentation-Rates (High), in Apparently Healthy South African Bantu Men : Reduction to Normal Levels of the (A. R. P. Walker, D. C. Fletcher, P. A. Reynolds, I. Bersohn and E. D. Sonnenfeld), 480
Erythrocyte Sphering Factor in Rat and Mouse Plasma (Dr. R. Barer and F. M. Gaffney), 277
Escherichia : Effect of a Coliform Organism, on the Second Ecdysis of Nematode Larvæ parasitic in the Horse (D. Poynter), 481
Escherichia coli · A Dielectric Study of the Low-conductance Surface Membrane in (Dr. Hugo Fricke, Herman P Schwan, Kam Li and Vernon Bryson), 134
  Studies of Biosynthesis in (Richard B. Roberts, Philip H. Abelson, Dean B. Cowie, Ellis T. Robson and Roy J. Britten), *review* by Dr. Kenneth McQuillen, 594
'Espinasse, Prof. Paul G., and Jones, Prof. Brynmor : *Obituary* of John Pryce-Jones, 775
E.S.S.E.C. Prize for 1956 for Cancer studies awarded to Prof. and Mme. Bernard Pullman by the Ligue Française contre le Cancer, 415
Essen, Dr. L., and Parry, J V. L. Atomic and Astronomical Time, 744
Esslinger, William · Science and Politics, 293
Esso Development Company : Grant to the University College of North Staffordshire to support a postgraduate research student in the Department of Chemistry, 70
Ester (Vitamin A), and Alcohol in the Liver of the Rat . Effect of Blocking the Reticulo-endothelial System on the Storage of (Dr. S. Krishnamurthy and J. Ganguly), 575
Esters of Monoribonucleotides Hydrolysis of (D. M. Brown, D. I. Magrath, A. H Neilson and Sir Alexander Todd), 1124
Esters (Glyceryl) · Urea Adducts of (Dr. Francis Aylward and P. D. S. Wood), 146
Esters (Thiophosphoric) : Metal-catalysed Hydrolysis of (Prof. J. A. A. Ketelaar, H. R. Gersmann and Miss M. M. Beck), 392
Estimation of Numbers of *Nitrosomonas* in Soil and Culture (J. W. Millbank), 848
Estimation of Vitamin K_3 : Spectrophotometric Method for the (Vanamala Sathe, J. B. Dave and Dr. C. V. Ramakrishnan), 276
Ethylenediamine : Bone treated with, as a Successful Foundation Material in Cross-Species Bone Grafts (Dr. Fred L. Losee and Lieut. Lloyd A. Hurley), 1032
Eucalyptus : Ectotrophic Mycorrhiza in Renantherous Species of (L. D. Pryor), 587
Euler, Prof. U. S. von, and Hillarp, N.-Å. · Evidence for the Presence of Noradrenaline in Submicroscopic Structures of Adrenergic Axons, 44
Europe : Technical Information Services in (European Productivity Agency of the Organization for European Economic Co-operation Report on), 695
Europe (Council of), and the High Authority of the European Coal and Steel Community : Fellowships for research into problems of European Interest, 263
European Archæology in London : Prehistoric, 1062
European Association of Exploration Geophysicists Meeting in London (L. H. Tarrant), 120
European Coal and Steel Community (Political and Economic Planning, Broadsheet No. 389), 1205
European Coal and Steel Community (Council of Europe and the High Authority of the) : Fellowships for research into problems of European interest, 263
European Co-operation in Nuclear Research (Unesco and its Programme, No. 11), 397
European Mycological Congress, 1159
European Organization for Nuclear Research : Scheme of Guest Professorships, 117
  Election of Officers, 117
  International Symposium on High-Energy Physics, 117, 1065
European Seismological Commission : Meetings in Vienna (Ernest Tillotson), 1021
Europées Congrès Toegepaste Electronenmicroscopie, Gent, 7–10 April 1954 : Rapport (edited by G. Vandermeerssche), *review* by Dr. V. E. Cosslett, 107
Evaluation of the Red Fox (Thomas G. Scott), 1073
Evans, D. H. L. : Title of reader in anatomy in the University of London conferred on, 215
Evans, Dr E. A., and others : Steric Effects in Anionotropic Rearrangements, 1167
Evans, Dr G. R · Elected a Fellow of the Royal Society of Edinburgh, 506
Evans, John : Awarded the Founder's Medal for 1956 of the Royal Geographical Society, 606
Evans, J. D. : Appointed to the University of London chair of prehistoric European archæology in the Institute of Archæology, 1017, 1062 ; work of, 1062
Evans, J. G. · The Tinctorial Arts To-day, 1009
Evans, Dr. J. R. Diet and Anæmia, 878
Evans, Lewis (1700–56), a Scientist in Colonial America (Prof. George W. White), 1055
Evans, Dr. R. E. : *Obituary* of Dr. H. E. Woodman, 648
Evans, Robert L. : Red-Cell Survival in Familial Hæmolytic Anæmias, 839
Evans, W. A. L., and Marsden, J. : Carbohydrases in Blow-fly Larvæ, 478
Everett, Prof. D. H. . The Teaching of Chemical Principles in School and University, 72
Everett, Dr. Guy M. : Tremor produced by Drugs, 1238
Evers, Dr. Norman, and Smith, Wilfred · The Analysis of Drugs and Chemicals, *review* by J R. Nicholls, 597
Evidence for the Presence of Noradrenaline in Submicroscopic Structures of Adrenergic Axons (Prof U. S. von Euler and N -Å Hillarp), 44
Evidence for a Reversible First-Order Phase Transition in Collagen–Diluent Mixtures (R. R. Garrett and Prof P. J Flory), 176
Evidence (Metallographic), of Mechanical Twinning in an Alpha-Beta Titanium Alloy (Dr. D. N. Williams), 436
Evolution : Conflict versus Co-operation as Factors in (Dr. Sunder Lal Hora), 781
  The Mechanism of (W. H. Dowdeswell), *review* by Dr. Maurice Ashby, 864

Evolution of Agricultural Research (Sir William Slater), 651
Evolution of a Scientific View of the Universe in the Physics of the Seventeenth and Eighteenth Centuries (B. G. Kuznetsov), (in Russian), *review* by Dr. R Eisenschitz, 1194
Ewer, Dr. R F. : Imprinting in Animal Behaviour, 227
Examination of Fossil Coccoliths in the Electron Microscope (Dr. C. Downie and Prof. R. W. K. Honeycombe), 947
Examination of Particulate Matter by Electron Microscopy and Electron Diffraction · Petroleum Ether (80°–100° C) used as a Dispersing Agent for the (E. H. Boult), 484
Exchange of Students for Technical Experience, International Association for the, 118
Excitation Energy of the *F*-band and Physical Constants for Alkali Halides : Empirical Relationship between the (M. Levy), 241
Excystment Factor (Amœba), produced by *Aerobacter* sp Occurrence and Nature of an (Dr. B. N. Singh, Miss S. Mathew and M. Sreenivasaya), 621
Expanding Space · Influence of, on the Gravitational Fields surrounding Individual Stars (Prof P C. Vaidya and K B. Shah), 802
Experimental Allergic Encephalomyelitis produced by Tubercle Bacillus Residues (J. Colover and Dr. R. Consden), 749
Experimental Biology, Society for : Symposium on the Biological Action of Growth Substances, 877
Experimental Inorganic Chemistry (Dr. W. G. Palmer), *review*, 499
Experimental Philosophy at Oxford, 1155
Experimental Tuberculosis—Bacillus and Host, with an Addendum on Leprosy (edited by G. E. W Wolstenholme and Margaret P. Cameron), *review* by Dr. Derek Hobson, 448
Experimentation (Field) . Principles and Practice of (Dr John Wishart and Dr H. G. Sanders), second edition, *review* by Dr. D. J Finney, 680
Experiments with Alternative Responses : A Combinatorial Design for (K. Strzemienski), 283
Experiments (Field) : Insect Mobility and Design of (R. J. V Joyce), 282
Experiments (Tracer) Electron Microscopy and Radioautography as Coupled Techniques in (Dr J. Liquier-Milward), 619
Exploration Hydrobiologique du Lac Tanganyika, 1946–47 (Institut Royal des Sciences naturelle de Belgique, Résultats scientifiques, Vol. 4, Fasc. 2), 1025
Exploration (Rocket), of the Upper Atmosphere (Dr. F. E. Jones and Prof. H. S. W. Massey), 643
Exploration Geophysicists, European Association of Meeting in London (L H. Tarrant), 120
Explosions (Nuclear) : Genetical Effects of Radiations from Products of (Prof. F W. Spiers), 226 ; (Prof J. B. S. Haldane), 227
Expression of the Emotions in Man and Animals (Charles Darwin), *review* by Prof John Cohen, 247
Extracted Muscle Fibre Systems : Auto-oscillations in (M. C. Goodall), 1238 , (Dr. L Lorand and C. Moos), 1239
Extraction (Solvent), of Polonium from Nitric Acid Solutions (J. Danon and A A. L. Zamith), 746

  Semi-Micro Organic Preparations, *review*, 957
  Organic Chemistry, *review*, 1194
Fowles, G. (arranged and edited by, with the assistance of Coulson, E. H., and Holt, Charles) : The Science Masters' Book, Series 3, Part 2, Chemistry, *review* by L C Stredder, 957
Fox (Red) : An Evaluation of the (Thomas G. Scott), 1073
Foxon, Prof G E. H. Cinematography in Scientific Research, *review*, 298
Fractionated Doses of X-Rays : Effects of Single and, on Mouse Embryos (Dr. Robert Auerbach , 574
Fractionation of Deoxyribonucleic Acid by Physical Procedures (Dr. K. V. Shooter and Prof. J. A. V. Butler), 1033
Fracture of Metals (Prof N. F. Mott), 692
Fraenkel, L. E Awarded the Edward Busk Memorial Prize of the Royal Aeronautical Society, 519
France : New Developments in Industrial Leadership in Great Britain, the United States, Germany and (edited by Frank A. Heller), 1001
Franchi, L. L (Barrington, Prof. E. J. W., and) · Organic Binding of Iodine in the Endostyle of *Ciona intestinalis*, 432
Francis, W. C , and others : Perfluoroalkoxy Radicals, 785
Francombe, M. H. : Low-Temperature Crystallography, 1068
Françon, Maurice · Le Microscope à Contraste de Phase et le Microscope Interférentiel, *review*, 680
Frank, Prof. F. C. Mechanism of Phase Transformations in Metals, 420
Frankcomb, T. A. : Appointed a member of the Advisory Council of the Commonwealth Scientific and Industrial Research Organization, 734
Franklin, Benjamin : The Scientific Work of (Prof. E. N. da C. Andrade), 60
  Studies on (*Proceedings* of the American Philosophical Society, Vol. 99, No 6), 413 , (*Journal* of the Franklin Institute, January), 414
Franklin (Benjamin) in Britain, 164
Franklin's (Benjamin) Purse (Exhibited by the Department of Mineralogy of the British Museum (Natural History)), 117
Franklin, Dr. R. E. . Semi- and Non-Crystalline Materials, 121
  Homogeneous and Heterogeneous Graphitization of Carbon, 239
  Structure of Tobacco Mosaic Virus—Location of the Ribonucleic Acid in the Tobacco Mosaic Virus Particle, 928
Franklin Institute, Philadelphia : *Journal* of the, January No., Panorama of Progress (in honour of Benjamin Franklin), 414
  Computing Service at the, 1206
Franks, Dr. J. : Metal Whiskers, 984
Franks, J. W. : Farming History in Great Britain (Pollen Analysis and its Bearing on Agricultural History), 171
Fraser, I. E. B., and Mulcock, A. P. : Staining of Wool by Bacterial Pigments, 628
Fraser, W. : Electricity, Direct and Alternating Current, *review*, 1101
Frazer, Prof. A. C. : Phospholipids in Foods, 565
  Obituary of Dr. Harry J. Deuel, jun , 872
  Chemistry and Biochemistry of Fats, *review*, 1050
Frazer, Prof. A. C., and others : Synthesis of Long-Chain Fats by Bacteria isolated from Human Fæces, 237
Frazer, Dr. J. F. D. : Breeding of Laboratory Animals, 1198
Frazier, N. W., and Posnette, A. F. : Leafhopper Transmission of a Clover Virus causing Green Petal Disease in Strawberry, 1040
Fréchet, Prof. M : Elected a member of the Geometry Section of the Paris Academy of Sciences, 1062
Fréchette, Prof. Van Derek (Insley, Herbert, and) : Microscopy of Ceramics and Cements, including Glasses, Slags and Foundry Sands, *review* by Dr. W. Campbell Smith, 640
Frecheville (William) Student's Prize for 1954–55 of the Institution of Mining and Metaillurgy awarded jointly to F. M. Vokes and W. G. Jeffery, 966
Fred, M. (Tomkins, F. S , and) . Spectroscopy, 737
Fredriksson, Kurt · Cosmic Spherules in Deep-Sea Sediments, 32
Free Amino-Acid Content of the Lymph (P. Braun, M. Foldi, S. Kisfaludy and Gy. Szabó), 1133
Free Amino-acids in Normal and Iron-deficient Plants of *Hibiscus esculentus* L. : Chromatographic Detection of (S D. Démétriadès), 95
Free Atmosphere in the Vicinity of Fronts—Analysis of the Observations by the Meteorological Research Flight, 1950–52 (J S Sawyer), 656
Free Nutation (Earth's) : Damping of the (Prof. B. Gutenberg), 887
Free-Piston Engines : Automobile (F. D. Robinson), 914
Freed, S , and others Spectroscopy, 738
Freedom . Academic, 1189
Freedom in American Universities, *review* by R. Brightman, 1190
Freedom (Academic) The Development of, in the United States (Prof. Richard Hofstadter and Walter P. Metzger), *review* by R. Brightman, 1190
Freedom (Academic), in Our Time (Prof. Robert M. MacIver), *review* by R. Brightman, 1190
Freeing Potatoes from Virus Y : Heat Treatment and Tissue Culture as a means of (A D Thomson), 709
Freeze-dried Apricots · Reactions between Amino-Acids, Organic Acids and Sugars in (E. F. L. J. Anet and T. M. Reynolds), 1082

Freezing Nuclei (Natural) : Measurements of, at High Altitudes (E. J. Smith, Dr. A. R. Kassander and Dr. S. Twomey), 82
Frei, E. : Electron Microscopy of Fibres, 319
Frei, E., and Preston, Prof. R D. : Fibre Microscopy, 516
French National School for Geographical Sciences : Course on the Theory and Practice of Aerial Photogrammetry, 831
Frequency Variations in New Zealand of 16 kc./s. Transmissions from GBR Rugby (A. H. Allan, D. D. Crombie and W. A Penton), 178
Fresh Water from Salt Water (D J. Neville-Jones), 270
Freshwater Biology in Scotland (Scottish Branch of the Institute of Biology Symposium on), 1115
Freshwater Science (Marine or) : Research in (Development Commission Grants for), 736
Freud, Sigmund . Lectures to commemorate the centenary of the birth of (British Psycho-Analytical Society), 363
The Interpretation of Dreams (translated from the German and edited by James Strachey), *review* by Sir Cyril Burt, 495
Fricke, Dr. Hugo, and others : A Dielectric Study of the Low-Conductance Surface Membrane in *E. coli*, 134
Fried, W., and others : Plasma Factor(s) influencing Red Cell Production, 1240
Friedlander, Dr. M. W. : Appointed a research associate in the Department of Physics of Washington University, St. Louis, Mo., 1109
Friedman, Constance L., and others : An Extrarenal Effect of Pitressin, 1079
Friedman, Prof. Sydney M., and others : An Extrarenal Effect of Pitressin, 1079
Friedmann, Dr. Herbert : African Honey-Guides, 173
Friends of the Lake District . Report and Newsletter for 1955, 262
Friesian Cattle Effects of Climate on Body Temperature and Respiration-rate of Buffaloes and (Dr. K. A. Alim and I. A. Ahmed), 900
Frisch, Prof. Karl von : Elected a Foreign Member of the Linnean Society of London, 1014
Frisch, Prof. O R. (edited by) : Progress in Nuclear Physics, Vol. 4, *review* by Dr. E. Bretscher, 54
Frog : Pseudo-Cholinesterase in the Central Nervous System of the (D. C. Hardwick and Dr. Catherine Hebb), 667
Frog (*Rana temporaria*) : Failure of Enforced Hibernation to inhibit Breeding in the (Dr. Rhoda M. Allison), 342
Frog Skin (Isolated, Short-circuited) : Oxygen Consumption and Active Transport of Sodium in the (Dr. K. Zerahn), 937
Fromageot, Prof. C. : The Neurohypophysis, 1019
Frontier to Space (Eric Burgess), *review* by Prof. D R. Bates, 202
Frontiers in Physical Optics (International Commission for Optics Symposium on), 263
Fronts : The Free Atmosphere in the Vicinity of—Analysis of the Observations by the Meteorological Research Flight, 1950–52 (J. S. Sawyer), 656
Fronts in Meteorology : Structure of, 656
Frost Point in the Stratosphere : Compressed Air Hygrometer for Measuring (R. J. Murgatroyd, P. Goldsmith and W E. H. Hollings), 568
Froude (William) Medal of the Institution of Naval Architects awarded to Sir Thomas Havelock, 167
Frozen State Preservation of Animals and Plants by Drying from the (Dr. D. A. L. Davies and V. S. G. Baugh), 657
Fructification (Male) : A New Type of, referable to *Glossopteris* (J. Sen), 337
Fruit and Cider Institute, National · Annual Report for 1954, 322
Fruit and Seed Production (Sir Edward Salisbury), 64
Fruit Juices : Fourth International Congress on (International Federation of Fruit Juice Producers), 693
Fruit Producers, International Federation of : Fourth International Congress on Fruit Juices, 693
Fry, D. B., and others : Studies in Communication contributed to the Communication Research Centre, University College, London, *review* by Prof. G. Patrick Meredith, 446
Fry, D. W. : Production and Utilization of Electromagnetically Enriched Isotopes, 157
Fuchs, Dr. Fritz, and Riis, Dr. Povl : Antenatal Sex Determination, 330
Fuel—Solid, Liquid and Gaseous (J. S. S. Brame and Dr. J. G. King), fifth edition, rewritten by Dr. J. G. King, *review*, 722
Fuel, Institute of : Conference on Domestic Heating in Great Britain, 414
Election of J. R. Rylands as president, 1015
Fuel in India (the late Prof. N. N. Saha), 923
Fukuda, T. · Conversion of Phenylalanine into Tyrosine in the Silkworm Larva (*Bombyx mori*), 429
Fulbright Program in the United Kingdom and Colonial Territories . Fifth Annual Report (1949–1954), 566
Fullman, Robert L., and Parke, Robert M. . General Electric Research Laboratory, Schenectady—New Metals and Ceramics Building, 71
Fulton, Prof. John F. : Awarded an honorary doctorate of medicine of the University of Upsala, 1159
Function of the Cow's Udder : A Radiographic Method for the Study of the (Dr. J. Bilek and Dr. M. Janovsky), 582
Functions of the Phenolase Complex : Structures and (Dr. H. S. Mason), 79
Fundamental Research : Human Motives in, 951
Fundamentals of Combustion : Some (Dr. D. B. Spalding), *review* by F. D. Robinson, 548
Fundamentals of Petroleum Geology : Some (Dr. G. D. Hobson), *review* by H. B. Milner, 6
Fundulus heteroclitus · Factors influencing the Transport of Sea Water Cations across the Ectoderm of (D. R. Shanklin), 431
Fungal Parasitism : Physiology of, 738
Fungal Spores (Viable) · A Gas Phase in (Prof. C. T. Ingold), 1242
Fungi : Amphithallism in (M. Eileen Kennedy and Prof. J. H. Burnett), 882
Ecology of the Higher (Symposium in the University of Liège), 1159
Mating Systems of (J. H. Burnett), 1215
Sporulation of, inside the Plant Host Cell (Hussein M. Elarosi), 665
Fungi (Mould) · Utilization of Xanthin by (Dr. E. D. M. Taha and M. Mokhtar Sharabash), 622
Fungi (Soil) : A Slide-trap Method for the Isolation of (Geoffrey W. F. Sewell), 708
Fungicides : Non-metallic (G. N. Mahapatra), 938
Furniture in Roman Britain (Joan Liversidge), *review* by W. F. Grimes, 547
Fürth, Dr. R. : Theoretical Physics, 269
Further Education, Northern Advisory Council for : Eighth Annual Report, 1112
Further Education for the South West, Regional Council for (College of Technology, Bristol, in collaboration with the) · Course on the Applications of Radioactive Isotopes in Industry and their Uses, 1065
Further Outlook (F. H. Ludlam and R S. Scorer), *review* by James Paton, 641
Fusarium moniliforme · Production and Properties of the Pectic Enzymes secreted by (R. K. Singh and R. K. S. Wood), 738
Fusion : Power from, 1016
Future : The Foreseeable (Sir George Thomson), *review* by R. Brightman, 3
Future of Mankind, *review* by Dr. R. E. Slade, 298
Future Numbers of University Students—the Desperate Need for Technologists (Lord Simon of Wythenshawe), 1214
Fyfe, Mrs. V. C. : Two Modes of Inheritance of the Short-styled Form in the 'Genus' *Oxalis*, 942
Fyfield Down Nature Reserve, 611

GABOR, Dr. D. · Elected a Fellow of the Royal Society, 558
Gábor, V., and others : New Methods for the Synthesis of Peptides, 841
Gaddum, Prof. J. H. : The Extra Pharmacopœia, *review*, 350
Statistics of Therapeutic Trials, *review*, 1007
The Prefix 'Nor' in Chemical Nomenclature, 1046
Gadus callarius (Codling) : Discoloration of Muscle Preparations from, by Degradation Products of 1-Methylhistidine (Dr. N. R. Jones), 748
Gaffney, F. M. (Barer, Dr. R., and) : An Erythrocyte Sphering Factor in Rat and Mouse Plasma, 277
β-Galactosidase in *Ophiostoma multiannulatum* : Synthesis of, and some Properties of the Enzyme (Dr. B. v. Hofsten), 844
Galactozymase : Complementary Action of Melibiase and, on Raffinose Fermentation (Prof. Ö. Winge and Dr. Catherine Roberts), 383
Galaxy : An Investigation of Monochromatic Radio Emission of Deuterium from the (G. J Stanley and R. Price), 1221
Galbraith, W. : Awarded a Commonwealth Fund General Fellowship, 735
Gale, Dr. E. F. : The Structure of Nucleic Acids and their Role in Protein Synthesis, 603
Gale, V. E. : Appointed principal agricultural officer, Western Region, Nigeria, 831
Gallenkamp and Co., Ltd., A. : Election of G. F. Adams and H. B. Toft to to the board of directors, 17
Galvanic Measurement of Dissolved Oxygen (A. G. Dowson and I. J. Buckland), 712
Gambles, R. Moylan : Eggs of *Lestinogomphus africanus* (Fraser), 663
Gambling, W. A , and Edels, Dr. H. : Formation of the High-Pressure Arc Column in Hydrogen, 1090
Game : Electric Fencing against, 166
Game Department, Uganda . Appointment of A. C. Brooks as biologist, 736
Game and Tsetse Control, Northern Rhodesia : Appointment of J. E. Clarke as entomologist, 561
Gamulin, T., and Hure, J. . Spawning of the Sardine at a Definite Time of Day, 193
Gandy, Dr. R. O. : Appointed lecturer in applied mathematics at the University of Leeds, 1017
Ganglion-blocking Agents : New Series of (Dr. D. W. Adamson, J. W. Billinghurst, A. F. Green and Dr. S. Locket), 523
Gangliosides from Human Brain : Composition of (Prof. Lars Svennerholm), 524
Ganguly, J. (Krishnamurthy, Dr. S., and) : Effect of Blocking the Reticulo-endothelial System on the Storage of Vitamin A Ester and Alcohol in the Liver of the Rat, 575
Garay, A. St. : Role of Ergothioneine and Catalase in Infection by Ergot Fungus (*Claviceps purpurea* Tul.), 91
Garibaldi, J. A., and Neilands, Prof. J. B. Formation of Iron-binding Compounds by Micro-organisms, 526
Garlick, K J. : The National Gallery, London, *review*, 596
Garnett, Dr. Alice : Awarded the Murchison Grant for 1956 of the Royal Geographical Society, 606
Garnett, David : Honorary Fellowship of the Imperial College of Science and Technology conferred on, 733
Garnham, Prof. P. C. C. : *Obituary* of Prof. P. A. Buxton, 67
Garrett, R. R., and Flory, Prof. P. J. : Evidence for a Reversible First-Order Phase Transition in Collagen–Diluent Mixtures, 176
Garton, Dr. G. A., and others : Muscular Dystrophy of Beef Cattle and Unsaturated Fats, 792, *erratum*, 1208
Garvitch, Z. S , and Probine, M. C. : Soil Thermometers, 1245
Garwood, Dr. R D · Mechanism of Phase Transformations in Metals, 420
Gas from a Chimney-Stack · Effect at Ground-level of (Dr. A. C. Best); 611
Gas Analysis · Modern (Paul M. Mullen), *review* by D. Ambrose, 550
Gas Clean-up Rates : Use of Krypton-85 in Measuring (Dr. D. J. Harris and Dr P. O. Hawkins), 285
Gas Dynamics of Cosmic Clouds—a Symposium held at Cambridge, July 6–11, 1953 (edited by H. C. van de Hulst and J. M. Burgers), *review* by Dr. F. D. Kahn, 352
Gas Flow at Very High Speeds : The Physics of (Physical Society Summer Meeting on), 1064
Gas Kinetics (A. F. Trotman-Dickenson), *review* by Dr. K. E. Howlett, 864
Gas Phase in Viable Fungal Spores (Prof. C. T. Ingold), 1242
Gas-Liquid Partition Chromatography as a Preparative Method : Use of (D. Ambrose and R. R. Collerson), 84
Gas-Multiplier, a New Type of Electron Multiplier (C. H. Vincent), 391, *erratum*, 415
Gascoigne, J. A. : Appointed a British Rayon Research Association Research Fellow in chemistry in the University of Birmingham, 215
Gases on Metals · Superficial Reactions of (Annual Meeting of the Société de Chimie physique), 693
Gases (Light) : Absorption of Ultrasound in (W. Tempest and Dr. H. D. Parbrook), 181
Gaskell, Dr. T. F. : Improvements in Seismic Prospecting, 1209
Gassner, Dr. Gustav : Mikroskopische Untersuchung pflanzlicher Nahrungs- und Genussmittel, dritte Auflage, *review* by Dr. C. R. Metcalfe, 863

'Glacier-Worms' in New Zealand So-called (Prof. N. E. Odell), 534

Glaciological Society, British : Annual General Meeting, 414
  Inscribed silver tray presented to Gerald Seligman, 414
  Discussion on Future Lines of Progress in Glaciology, 414
  Election of Officers for 1956, 414
Glaciological Society, British (Royal Meteorological Society and the) : Discussion on Snow Accumulation and Ablation, 563
Glaciology : Future Lines of Progress in (British Glaciological Society Discussion on), 414
Glanville, Prof. S. R. K. : *Obituary* by H. S. Smith, 1013
Glaser, Prof. E. M. : Appointed to the University of London readership in physiology at the London Hospital Medical College, 779
Glasgow Conference on Nuclear and Meson Physics : Proceedings of the 1954 (edited by E. H. Bellamy and R. G. Moorhouse), *review* by Dr. J. C. Bower, 154
Glass : Bombardment of, by Alpha-Particles (D. G. Tuck), 434
  Growth of Bovine Amniotic Ectoderm as a Cell Monolayer on, and its Use as a System for Virus Multiplication (T. W. F. Pay), 752
Glass (Metaphosphate) : Colour Centres in (James H. Schulman), 287 ; (Sadhan Basu), 287
Glass Technology, Society of : Election of Dr. J. H. Partridge as president, 827
Glasses, Slags and Foundry Sands : Microscopy of Ceramics and Cements, including (Herbert Insley and Prof. Van Derek Fréchette), *review* by Dr. W. Campbell Smith, 640
Glasshouse Crops Research Institute : Retirement of Dr. W. F. Bewley from the directorship, 211
  Appointment of F. W. Toovey as director, 212
Glen, W. L., and others : Isolation of β-Dihydroequilin and α-Dihydroequilenin from the Urine of Pregnant Mares, 753
Glendinning, D. R. : Appointed scientific officer, plant breeder, West African Cacao Research Institute, Gold Coast, 1207
Glenister, Dr. T. W. : Determination of Sex in Early Human Embryos, 1135
Gliotoxin in Soils : Production of (Joyce M. Wright), 896
Globicephala melaena : The Carotid Body of the Pilot Whale (L. L. de Kock), 1084
γ-Globulin (Serum) : Effect of Cortisone on the (R. S. Snell and Prof. T. Nicol), 578
Glossopteris : A New Type of Male Fructification referable to (J. Sen), 337
Glover, Dr. S. G. : Mechanism of Phase Transformations in Metals, 420
Glucagon and the Regulation of Carbohydrate Metabolism (Dr. H. Elrick), 892
Gluckman, Prof. Max : Conflict and Cohesion in Zululand (Sir Josiah Mason Lectures of the University of Birmingham), 215
  Custom and Conflict in Africa, *review* by Dr. E. R. Leach, 1098
D-Glucosamine : Anaerobic Deamination of, by Bacterial and Brain Extracts (Dr. P. Faulkner and Prof. J. H. Quastel), 1216
γ-Glutamyl Peptides : Enzymic Formation of Pyrrolidone Carboxylic Acid from (George E Connell and Prof. Charles S. Hanes), 377
Glutathione : Coupled Oxidation of Keto-Acids with (D. Cavallini, G. F. Azzone and F. Stirpe), 1232
Glyceryl Esters : Urea Adducts of (Dr. Francis Aylward and P. D. S. Wood), 146
Glycosides (Cardiac) : A Method for Determining the Duration of Action of the (M. Rand and Anne Stafford), 278
Glycyl-L-Alanine Hydrochloride : Crystal Structure of (Dr. T. C. Tranter), 37
Gobioid Fish : Self-inflation in a (Prof. J. L. B. Smith), 714
God : Dancers of (Nóel Ballif), translated from the French by James Cameron, *review*, 641
Godfrey, D. G. : Appointed scientific officer (parasitologist), West African Institute for Trypanosomiasis Research, Nigeria, 1207
Godwin, Dr. Harry : The Quaternary History of the British Flora (Huxley Lecture for 1956 of the University of Birmingham), 215
Goffe, Dr. A. P. : Infections in Laboratory Animals, 1198
Gold, L. W., and Williams, G. P. : Dependence of Snowfall on Temperature, 1137
Gold, T. . Kelvin on the Origin of the Earth, 802
Gold Coast : Pteridophyta in the (C. D. Adams and A. H. G. Alston), 214
  The Reniform Nematode in the (F. C Peacock), 489
  Soil, Vegetation and Land-use Surveys in the, 118
Gold Medal of the Institution of Mining and Metallurgy awarded to Dr. J. A. Bancroft, 966
Gold Medal for 1956 of the Linnean Society of London awarded to Prof. W. H. Lang, 1014
Gold Medal of the Royal Aeronautical Society awarded to Sir William Farren, 919
Gold Medal of the Royal Astronomical Society awarded to Prof. T. G. Cowling; 119
Gold Sols as an Aid to Focusing in High-Resolution Electron Microscopy : Use of (T. H. Flewett and Pamela Tymms), 98
Goldberg, Dr. Philip A. . Electromagnetic Phenomena of Natural Origin in the 10–150 c./s. Band, 1219
Golding, E. W. : The Generation of Electricity by Wind Power, *review* by Dr. C. W. Marshall, 1050
Goldney, Kathleen M., and others : The Haunting of Borley Rectory, *review* by Prof. F. J. M. Stratton, 595
Goldschmidt, Dr. H. J. : Mechanism of Phase Transformations in Metals, 420
Goldsmith, Maurice : The Presentation of Science to the Public, 1067
Goldsmith, P., and others : Compressed Air Hygrometer for Measuring Frost Point in the Stratosphere, 568
Goldwasser, E., and others : Plasma Factor(s) influencing Red Cell Production, 1240
Golgi Apparatus and the Electron Microscope (Prof. J. Brontë Gatenby and R. G. Lutfy), 1027
Gonadotrophin Assay in the Rat : Environmental Factors influencing (Dr. M. R. A. Chance), 228
Gonadotrophins : Viability and Developmental Capacity of Eggs from Immature Mice treated with (Allen H. Gates), 754
Gonsalves, Dr. N. Botafogo, and others : Carioazulene, Natural and Synthetic, derived from Caryophillene, 145
Good Men . The Education of (M. L. Jacks), 150
Goodall, M. C. : Auto-oscillations in Extracted Muscle Fibre Systems, 1238
Goodey, J. B., and others : *Aphelenchoides* sp. destroying Mushroom Mycelium, 795
Gooding, E. G. B., and Duckworth, R. B. : Accelerated Storage Tests for Dehydrated Vegetables, 897
Goodman, L. S. : Spectroscopy, 738
Goodman, Miss N. M. : Appointed by the Medical Research Council to the Mapother Bequest Research Fellowship for 1956–57, 464
Goodrich, D. R. · Appointed senior agricultural officer, Gold Coast, 1207
Goodridge, Dr. Malcolm : Presented with a plaque by the New York Academy of Medicine, for outstanding services, 261
Goodspeed, Prof. T. H. : Elected a foreign member of the Royal Academy of Sciences in Sweden, 70
  The Genus Nicotiana, *review*, 203
Goodway, K. M. : Progress in the Study of the British Flora, 1164
Goodwin-Bailey, K. F. : Resistance of Insects to Insecticides, 356
Gordon, Colonel D. H., and Allchin, Dr. F. R. : Rock Paintings and Engravings in Hyderabad, 1063
Gordon, Dr. R. F. : Appointed adviser on poultry research to the Agricultural Research Council, 877
  Infections in Laboratory Animals, 1198
Gordon, Dr. R. L. : Semi- and Non-Crystalline Materials, 122
Gordon, W. L. : Low-Temperature Crystallography, 1068
Gordy, Prof. Walter, and others : Microwave Detection of Metallic Ions and Organic Radicals in Plant Materials, 984
Goreau, Thomas : Histochemistry of Mucopolysaccharide-like Substances and Alkaline Phosphatase in Madreporaria, 1029
Gorter, Dr. A. : Documentation of Applied Chemistry, 168
Gorter, Dr. E. W. : Some Recent Developments in Magnetism, 517
Gould, D. S. (Eppelsheimer, Prof. D. S., and) : Deformation Characteristics of Hafnium, 241
Goulden, J. D. S. : Infra-Red Absorption Spectra and Protein-Sugar Interactions, 85
Gouriet, G. G. : An Introduction to Colour Television, *review* by G. R. Noakes, 497
Government : Research in Industry and, 412
Government (World) : Sixth Parliamentary Conference on, 1159
Government Information Services—Statement showing Estimated Expenditure, 1955–56 (White Paper on), 691
Government Pressures on the Press (International Press Institute, Survey No. 4), 650
Government Research in Britain : Control of, 805
Government Responsibility in Industrial Research (Society for Visiting Scientists Discussion on), 171
Government Support of Agricultural Research in Britain, 68
Government Support for Research in Great Britain, 761
Gowan, Dr. J. E. : Vegetable Tannins, 880
Gowers, D. B. : Fibre Microscopy, 516
Gowers, D. S. : Fibre Microscopy, 515
Gracey, T. L. : Appointed assistant bacteriologist, Medical Department, Jamaica, 70
Gradients in One Direction : Latin-Square Designs with Individual (C. P. Cox), 1092
Graduate Fellowship (1956–57) of the Mycological Society of America awarded to Lennart Holm, 877
Graduates : Careers for (edited for the University of London Appointments Board), *review* by T. H. Hawkins, 300
Graduates (British) : Employment Statistics for Recent, 569
Graduates (Science and Engineering) : Shortage of, in British Industry (Federation of British Industries), 312
Graduates' Jobs (Political and Economic Planning, Broadsheet No. 387), 569
Grafflin, Mildred W., and others (edited by) : Cellulose and Cellulose Derivatives, second edition, *review* by Prof. E. L. Hirst, 677
Graham, Prof. Alastair : Pelagic Mollusca, 1023
Graham, Dr. G. N. (Saxl, Dr. H., and) : Connective Tissue and its Changes with Age, 468
Graham, Janet : Awarded a Commonwealth Fund General Fellowship, 735
Graham, Michael : The Chemistry and Fertility of Sea Waters, *review*, 549
Graham, Prof. R. P. (Cragg, Prof. L. H., and) : An Introduction to the Principles of Chemistry, *review*, 499
Grainger, Dr. John : Long Ashton Research Station—Report for 1954, 322
Grande Ufficiale al Merito della Repubblica : Order of the, bestowed by the Italian Foreign Minister on Sir Cyril Hinshelwood and Prof. E. B. Chain, 1156
Grange, Dr. L. I. : Retirement from the directorship of the Geological Survey of New Zealand, 776 ; work of, 776
Grant, C. H. B. (Mackworth-Praed, C. W., and) : Birds of Eastern and North-Eastern Africa, *review* by Sir Landsborough Thomson, 203
Grant, Dr. C. K. : The Metaphysics of Science, 369, 998
Grant, G. A , and others : Isolation of β-Dihydroequilin and α-Dihydroequilenin from the Urine of Pregnant Mares, 753
Grant, Miss M. W. : Revision of the Policy on Bread in Great Britain, 1150
Grant, P. M., and others : Ionophoresis of Oligosaccharides as N-Benzylglycosylammonium Ions, 1125
Grants for Geological Research in Scotland and the north of England (Clough Memorial Research Fund of the Edinburgh Geological Society), 415
Grants for Medical Education in the United States (Commonwealth Fund, New York), 1064
Grants for Research in Marine Biology or Oceanography (Challenger Society), 1018
Grants (Research) · Leverhulme Fellowships and (Awards for 1956), 918
Grants-in-aid for Medical Research (Life Insurance Medical Research Fund of Australia and New Zealand), 511
Grants, Scholarships or Fellowships for Research on Diseases of the Blood, with special reference to Leukæmia (Lady Tata Memorial Fund), 415, 1208
Granulation (Chromospheric) : Correlation Patterns in the (J. T. Jefferies and R. E. Loughhead), 180
Graphitization . Homogeneous and Heterogeneous, of Carbon (Dr. Rosalind E. Franklin), 239
Grass : Two Ears of Corn, Two Blades of (D. H. Killeffer), *review* by Dr. R. E. Slade, 298

Grassland and the Feeding of Livestock (Nutrition Society Symposium on), 1113
Grassland Soils (Natural) : *Rhizoctonia* in (R. H. Thornton), 230
Gravitational Fields surrounding Individual Stars : Influence of Expanding Space on the (Prof. P. C. Vaidya and K. B. Shah), 802
Gravitational Significance in Riemannian Geometry : Results of (Prof. V. V. Narlikar), 1138
Gray, Prof. C. H. (Adcock, L. H., and) : Metabolism of Sorbitol, 329
Gray, Dr. E. G. : Abnormal Colour Responses of the Minnow resulting from Inhibition of Movement, 91
Gray, F. A., and Brooks, S. A. : Awarded jointly an additional Williams Prize for 1954 of the Iron and Steel Institute, 919
Gray, Malcolm : Consolidation of the Crofting System, 1750–1850, 1071
Gray, Dr. Peter : Awarded the Meldola Medal for 1955 of the Society of Maccabæans, 507 ; work of, 507
Gray, Prof. P H. H., and Lachance, R. A. : Assimilation of Berberine by Bacteria, 1182
Gray, P. M. J. : Given a Capper Pass Award for 1955 by the Institution of Mining and Metallurgy and the Institute of Metals, 363
Great Britain : Domestic Heating in (Institute of Fuel Conference on), 414
  Farming History in (British Agricultural History Society and the Association of Agriculture Conference on), 171
  Fossil Plants of the Carboniferous Rocks of (Dr. Robert Crookall), (Memoirs of the Geological Survey of Great Britain, Palæontology, Vol. 4, Part 1), *review* by Prof. J. Walton, 152
  Government Support for Research in, 761
  Industrial Trade Associations in (Political and Economic Planning, Broadsheet No. 383), 1110
  Research in Industry in (Dr. B. K. Blount), 412
  Revision of the Policy on Bread in (Miss M. W. Grant), 1150
  Science and Defence in, 18
  Shortage of Scientific Workers in, 967
  Sitka Spruce and Douglas Fir in America and, 1207
  Studies of North-West American Forests in relation to Sylviculture in (R. F. Wood), 1207
  The Surface Water Year Book of, 1945–53 (Ministry of Housing and Local Government : Scottish Office), 75
  Technical College Libraries in, 509
  Technical Education in (Dr. H. V. Lowry), 970
  Water Resources of (Prof. W. G. V. Balchin), 75
  The Weather Service in, 1158

Lapage, Dr G. : Outline of Parasitology, *review*, 55
Laplace Integral (Two-sided) Operational Calculus based on the (Dr. Balth van der Pol and Dr. H. Bremmer), second edition, *review* by Prof L. M. Milne-Thomson 954
Lapp, Prof R. E. : Genetic Problems of the Atomic Age, 103
Large Drops Shattering of (R. H. Magarvey and B. W. Taylor), 745
Large-Chain Molecules : The Morphology of (Prof Ch. Sadron), 205
Large-Scale Weather Processes (Dr. R. C. Sutcliffe), 113
Larizza, Prof P. : Chemistry, Biochemistry and Pharmacology of Thioctic Acid, 75
Larrson, L. E. Mechanism of Phase Transformations in Metals, 419
Larter, L. N. H. : Appointed chief research officer, Federation of Malaya, 736
Larva (Tachinid) : Site of Hibernation of a, within its Host (Prof. J. de Wilde and P. H. van Doesburg), 1087
Larvæ (Blow-fly) : Carbohydrases in (W. A. L. Evans and J. Marsden), 478
Larvæ (Mosquito) : Environmental Factors affecting Hairiness in (Donald H. Colless), 229
Larvæ (Nematode), parasitic in the Horse : Effect of a Coliform Organism (*Escherichia*) on the Second Ecdysis of (D. Poynter), 481
Larvæ and Adults of Mosquitoes : Uptake of Radioactive Phosphorus by (L. J. Bruce-Chwatt and Dr. J. Hayward), 661
Laryngeal Muscles (Internal), during Phonation : Action Potentials from (K. Faaborg-Andersen and Dr. Fritz Buchthal), 340
Late Pregnancy in Sheep Prevention of Toxæmia of (H. B. Parry), 288
Latex of Apocynaceae (J. van Die), 830
Latham, Wing-Comdr. F. : Collected Papers on Aviation Medicine, *review*, 57
  Anthropometry and Human Engineering, *review*, 350
Latin America Mycological Collections : Second General Catalogue of (Unesco Centre for Scientific Co-operation), 921
Latin-Square Designs with Individual Gradients in One Direction (C. P. Cox), 1092
Latitudes (High Southern) : Cosmic-Ray Increase observed at, on February 23, 1956 (Dr. A. G. Fenton, K. G. McCracken, N. R. Parsons and P. A. Trost), 1173
Lattice Constant of Cr_2O_3 : Changes in the, near the Curie Temperature (Selma Greenwald), 286

Lauda, Dr. H. : Photographische Methoden in der Radiochemie, *review* by Prof. F. A. Paneth, 953
Lauder, K. H. : A Brief Review of Science and Technology in Western Germany (Department of Scientific and Industrial Research), 316
Lauffer, Max A., and others Mechanism of Inactivation of Tobacco Mosaic Virus by X-rays, 890
Laven, Hannes : Cytoplasmic Inheritance in *Culex*, 141
Lawrence, Prof. E. O. : High-Current Accelerators, 470
Lawrence, George H. M. : An Introduction to Plant Taxonomy, *review* by Prof. T. G. Tutin, 546
Lawrence, O. N . Awarded the Herbert Akroyd Stuart Memorial Prize of the Royal Aeronautical Society, 919
Lawrence, T. . Barley Mutants, 876
Lawrence, W. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 219 , work of, 219
Lawrie, J. J. : Appointed principal forestry officer, Somaliland Protectorate, 70
Laws, E. Q. : Quantitative Micro-Analysis, *review*, 153
Laws of Nature (Prof. R. E. Peierls), *review* by Prof. R. W. Ditchburn, 151
'Laws of Thought' by George Boole : Celebration of the Centenary of the (Proceedings of the Royal Irish Academy, Vol. 57, Section A, No 6), 554
Laycock, G. F. : Awarded honorary membership of the Institution of Mining and Metallurgy, 966
Laymen . Tropical Hygiene for (Ross Institute Course on), 922
Layrisse, Dr. Miguel, and Arends, Dr. Tulio : The *Diego* Blood Factor in Chinese and Japanese, 1083
Layrisse, Dr. Miguel, and others : The *Diego* Blood Factor, 40
Lazenby, P. G. : Improvements in Seismic Prospecting, 1209
LeBaron, Dr. F. N. . Chemistry of Phospholipids, 21
Le Clerc, Miss J. : Action of Ribonuclease on the Multiplication of the Influenza Virus, 578
LeCouteur, Dr. K. J. : Appointed to the chair of theoretical physics in the Australian National University, 116 ; work of, 116
Lea, Dr. C. H. : Phospholipids in Foods, 565
Lea, Dr. C. H. (Rhodes, Dr D.-N., and) : Composition of Egg Phospholipids, 1129
Leach, Dr. E. R. : Virtuous Quarrels, *review*, 1098
Lead Tetramethyl : Absorption Spectra arising from the Photolysis of (Dr. C. L. Cook and J. G. Clouston), 1178
Leadership in a Modern Democracy, 293
Leadership (Industrial) : Human Problems of, 1001
Leadership (Industrial), in Great Britain, the United States, Germany and France New Developments in (edited by Frank A. Heller), 1001
Leaf Growth (University of Nottingham, Easter School in Agricultural Science, Discussion on), 1114
Leaf Movements and the *Tagesrhythmik* Explanation of Photoperiodism (Dr. M. Holdsworth), 845
Leafhopper Transmission of a Clover Virus causing Green Petal Disease of Strawberry (N. W. Frazier and A. F Posnette), 1040
Learmonth, Dr. A. T. A. : Awarded a Fellowship by the Leverhulme Trustees, 918
Learning in Man and Animals (Section of Comparative Medicine of the Royal Society of Medicine Discussion on), 1147
Learning (Higher), in Britain (Prof. George F. Kneller), *review* by Prof. W. H. G. Armytage, 1005
Leather Trades' Chemists, Society of : Symposium on Vegetable Tannins, 215, 562, 879
Leaver, Dr A. G. (Irwin, Dr. M., and) Use of the Orcinol–Sulphuric Acid Reaction in the Positive Identification of certain Monosaccharides from a Salivary Mucoid, 1126
Leaves The Growth of (Prof. F. L Milthorpe), 1114
  Morphogenesis in (E. Njoku), 778
Leaves of White Clover and Perennial Ryegrass : Components of the Total Magnesium Content within the (T. F. Neales), 388
Leaves (*Nicotiana*), after Removal from Plant : Amino-Acid Metabolism of (Shri Ranjan and M. M. Laloraya), 235
Lebanon : Recent Earthquakes in, 560
Lederle Travelling Fellowships in Medicine (Medical Research Council), 215
Ledvina, M , and others : Di- and Mono-Taurobilirubin similar to a Directly Reacting Form of Bilirubin in Serum, 895
Lee, H. D. P. : The Place of Science and the Humanities in Education, 960
Leech, Dr. J W. Theoretical Physics, 268
Lees, Dr. A. D. The Physiology of Diapause in Arthropods, *review*, 907
Lees, Dr. Howard : Biochemistry of Autotrophic Bacteria, *review* by Dr. Jane Meiklejohn, 809
Leggat, G. J. : Appointed conservator of forests, Uganda, 1207
Legowski, T J , and Brown, E. B. : Reproduction of Potato Root Eelworm during the Winter in a Potato Clamp, 287
Lehmann, Dr. H (Horsfall, Dr. W. R., and) : Absence of Abnormal Hæmoglobins in some Australian Aboriginals, 41
Lehninger, Prof. A. L. : Elected a Member of the National Academy of Sciences, Washington, 926
Leitch, Prof. Duncan *Obituary* by Dr. J Weir, 309
Length : Septate Fibres in Angiosperms and their (K A. Chowdhury, S. K. Purkayastha, S. S. Ghosh and J. S. Sond), 1243
  The Standard of, and the Standard of Time (Dr. Albert Pérard), 850
Length of Day and Geotropic Response in Seedlings : Relationship between (E. Dorothy Brain), 323
Length of the Muscle Fibres of the Rat Diaphragm (J. A. B. Barstad, E. Gjone and A M. Lovlie), 581
Lenihan, Dr. J. M. A. : Personal Impressions of the Geneva Conference on the Peaceful Uses of Atomic Energy, 780
Lens (Bovine) Lipide (Sudan Black Positive) Corpuscles in the (Dr. A. J. Dark), 48
Leonardo da Vinci Lectures for boys (Institution of Mechanical Engineers), 609
Leopold, Prof A. Carl : Auxins and Plant Growth, *review* by Prof. L. J. Audus, 809
Lepidopterous Tympanal Organs Electrical Responses of certain (Dr. P. T. Haskell and P. Belton), 139
Leprosy . Research on Tuberculosis and, *review* by Dr. Derek Hobson, 448
Leptospirosis in Piggery Workers (Dr. H. E. Seiler, J. Norval and Dr. Joyce D. Coghlan), 1042
Lestinogomphus africanus (Fraser) : Eggs of (R. Moylan Gambles), 663
Lethality (Dominant), induced by X-Rays in Haploid and Diploid *Saccharomyces cerevisiae* (M. E. Owen and R. K. Mortimer), 625
Letters to a Young Naturalist (Maxwell Knight), *review*, 300
Lettuce Seedlings : Growth of (Winifred M. Dullforce), 1244
Leucocytes of the Mouse : Influence of a Magnetic Field upon the (Prof. J. M Barnothy, M. F. Barnothy and I. Boszormenyi-Nagy), 577
Leukæmia : Research on Diseases of the Blood, with special reference to (Lady Tata Memorial Fund Grants, Scholarships or Fellowships for), 415, 1208
Leukæmia 8 (Rat Lymphocytic) : Remission of, following Intravenous Administration of 4-(*p*-Diethylaminostyryl)quinoline Dihydrochloride (Dr. Boland Hughes, Margaret Reed Lewis and Aubrey L. Bates), 331
Leukæmia and allied Diseases : Research on (Lady Tata Memorial Fund Awards for 1956–57), 415, 1208
Levels of Thyroid and Thyrotrophic Hormones in the Blood of Rats at various Stages of the Œstrous Cycle (Dr. Fouad A Soliman and Helmy M. Badawi), 235
Levels (Normal) : Reduction to, of the High Erythrocyte Sedimentation-Rates in Apparently Healthy South African Bantu Men (A. R. P. Walker, D. C. Fletcher, P. A. Reynolds, I. Bersohn and E. D. Sonnenfeld), 480
Levengood, W. C : Influence of a Magnetic Field on Thermal Convection Patterns, 631, *erratum*, 779
Leverhulme Fellowships and Research Grants (Awards for 1956), 918
Levi, J. D. : Mating Reaction in Yeast, 753
Levine, Dr. Philip, and others : The *Diego* Blood Factor, 40
  The Blood Group Antigen *Diego* in North American Indians and in Japanese, 1084
Levine, P. L. : Awarded a Salters' Scholarship by the Salters' Company, 1113
Levinson, Prof. Norman (Coddington, Prof. Earl A , and) : Theory of Ordinary Differential Equations, *review*, 722
Levy, M Empirical Relationship between the Excitation Energy of the *F*-band and Physical Constants for Alkali Halides, 241
Lewin, L. Request for information on Dilogarithms and related Functions , 1208
Lewis, J. F., and Lloyd, E. : Electrical Equipment of Aircraft, 1211
Lewis, Marion, and others : The Blood Group Antigen *Diego* in North American Indians and in Japanese, 1084
Lewis, Margaret Reed, and others : Remission of Rat Lymphocytic Leukæmia 8 following Intravenous Administration of 4-(*p*-Diethylaminostyryl)quinoline Dihydrochloride, 331
Lewis, Dr. S. E., and Price, G. M. : 'Malic Enzyme' Activity in Blowfly Muscle, 842
Lewis, Dr. W. B : Semiconductors, 833
Lewis, Dr. W. B., and others : International Comparisons of Radioactivity Standards, 12
Lewis, Prof W. C. McC. *Obituary* by Dr. E. A. Moelwyn-Hughes, 603
Leydig-cell Homologue in certain Teleost Fishes (Dr. A. J. Marshall and B. Lofts), 704
Li, Kam, and others : A Dielectric Study of the Low-Conductance Surface Membrane in *E. coli*, 134
Liberal Education : The Place of Meteorology in (Royal Meteorological Society Prize for an essay on), 415
Libraries (Technical College), in Great Britain, 509
Library Association : Memorandum on Libraries in Colleges of Technology and Further Education, 509
Lichen (An Arctic), *Siphula ceratites*, in Scotland (D. N. McVean), 797
LIDO, a research reactor of the 'Swimming-pool' pattern, under construction at the Atomic Energy Research Establishment, for the study of shielding problems, 777
Lieberman, Dr. D. S : Mechanism of Phase Transformations in Metals, 420
Liebmann, Dr. G. : International Analogy Computation Meeting, 20
Life in a Mental Hospital : Social Analysis of, *review* by Dr G. M Carstairs, 250
Life (Adult), in a Scolytid Beetle : Flight-muscle Changes during (Dr. John A. Chapman), 1183
Life (Working) Optimal Span of, *review* by Prof. John Cohen, 449
Life-History of Bacteria . The Cytology and (Dr. K. A Bisset), second edition, *review* by Dr. C. S Cummins, 1007
Life Insurance Medical Research Fund of Australia and New Zealand : Awards for research, 511
Light, Dr. Albert, and Simpson, Dr. Melvin V. : Paper Chromatography of Insulin, 225
Light : Correlation between Photons in Two Coherent Beams of (R. Hanbury Brown and R. Q. Twiss), 27
  New Determinations of the Velocity of (Colonel R. C. A. Edge), 618
Light (Flickering) Colour Illusions and Aberrations during Stimulation by (Dr. W Grey Walter), 710
Light Gases : Absorption of Ultrasound in (W. Tempest and Dr. H. D. Parbrook), 181
Light Metals : International Convention on, 736
Light Orientation : Role of the Terminal Pigment Spots of the Starfish, *Asterias forbesi*, in (Prof. M. Rockstein), 341
Light-scattering (Gelatin), by a New Enzymic Digestion Technique (Dr. G. Stainsby), 745
Lightbody, J. S. : Appointed assistant conservator of forests, Kenya, 70
Ligue Française contre le Cancer : E.S.S E.C Prize for 1956 for cancer studies awarded to Prof. and Mme. Bernard Pullman, 415
Lilly (Eli) Travelling Fellowships in Medicine (Medical Research Council), 215
Lilly, Lorna J , and Thoday, Dr. J. M. : Effects of Cyanide on the Roots of *Vicia faba*, 338
Lime : A Dietary Effect in Maize developed during Treatment with (P L. Pellett and Prof B. S. Platt), 422
Lindegren, Prof. Carl A , and others : Cytoplasmic Structures in Yeasts, 1041
Linderstrom-Lang, Prof. K. U : Elected a Foreign Member of the Royal Society, 827, 918 . work of, 918
Lindley, A. L. G : Nuclear Energy, 205
Lindner, H. R., and Ferguson, Dr. K. A : Influence of the Adrenal Cortex on Wool Growth and its relation to 'Break' and 'Tenderness of the' Fleece, 188

Lindner, J W., and Davis, S P. : Spectroscopy, 737
Line Broadening : Phenomenological Considerations of the Interruption Theory of (Dr. Robert G Breene, jun.), 922
Linen Industry Research Association : Annual Report for 1954, 69
  Annual Report for 1955, 363
  Retirement of Dr. A. J Turner as director of research, 460
  Appointment of D. A. Derrett-Smith as director of research, 460
Ling, Wang, and others : Chinese Astronomical Clockwork, 600
Linnean Society of London : Linnean Gold Medal for 1956 awarded to Prof. W. H. Lang, 1014
  Election of Officers for 1956–57, 1014
  Election of Foreign Members, 1014
Linnett, Dr. J. W. : Recent Advances in Stereochemistry, *review*, 811
Linstead, Dr R. P. : Recent Advances in the Chemistry of Colouring Matters, 645
  The Place of Science and the Humanities in Education, 960
Lintner, Dr. K., und anderes : Messung Radioaktiver Strahlen in der Mikrochemie, *review* by Prof. F. A Paneth, 953
Lipæmia Clearing Action of Sulphated Animal Hyaluronate (Prof. Theodore Gillman, Michael Hathorn and Jack Penn), 894
Lipid Fraction (Brain) : Inhibition of Influenza Virus Hæmagglutination by a (Abraham Rosenberg, Dr. Calderon Howe and Prof. Erwin Chargaff), 234
Lipide (Sudan Black Positive) Corpuscles in the Bovine Lens (Dr. A. J. Dark), 48
Lipids, their Chemistry and Biochemistry (Prof. Harry J. Deuel, Jr.), Vol. 2, Biochemistry—Digestion, Absorption, Transport and Storage, *review* by Prof A. C. Frazer, 1050
Lipids of Biochemical Significance : The Chemistry of (Dr. J. A. Lovern), *review* by Prof. A. C. Frazer, 1050
Lipotropic Agent : Lactose as a (Prof. D. P. Sadhu), 1236
Lipschutz, Prof. A., and others : Comparative Antiœstrogenic Potencies of Progesterone and 17α-Hydroxyprogesterone, 478
Lipscomb, Prof. W N. : Low-Temperature Crystallography, 1068
Lipson, Prof. H. : Mechanism of Phase Transformations in Metals, 420
  An Introduction to Interferometry, *review*, 864
Liquid Helium II : Tensile Strength of (Prof. A. D. Misener and G. R. Hébert), 946
Liquids : Viscosity of, and Ultrasonic Studies (Prof. A. K. Dutta, B. C. Ray and H. K. Rout), 1227
Liquids (Viscous), in Branched Tubes : Flow of, with reference to the Hepatic Portal Vein (Dr. C. H. Barnett and Dr. W. Cochrane), 740
Liquier-Milward, Dr. J. : Electron Microscopy and Radioautography as Coupled Techniques in Tracer Experiments, 619
Liquori, Prof. A. M., and others : Isosterism and Molecular Fourier Transform—Crystal Structure Determination of 2-4-Dihydroxybenzoic Acid as related to that of 2-Hydroxy-4-aminobenzoic Acid, 944
Lister, H. : Snow Accumulation and Ablation, 563
Literature of 1952 : Zoological, *review* by Dr. Edward Hindle, 200
Little, A. G., and others : Absorption of 3 5-m. Radiation in the Optical Emission Nebula, *NGC* 6357, 178
Little, Dr. K : Fibre Microscopy, 515
Liver of the Rat : Effect of Blocking the Reticulo-endothelial System on the Storage of Vitamin A Ester and Alcohol in the (Dr. S. Krishnamurthy and J. Ganguly), 575
Liver and Brain Mitochondria : Action of Chlorpromazine on Oxidative Phosphorylation of (Magdalena Berger, H. J. Strecker and Prof. H. Waelsch), 1234
Liver (Rat-) Mitochondrial Respiration : Effect of $\beta\beta$-Methylethyl Glutarimide and Amytal on (Prof. O. Jalling), 330
Liver (Rat), and Hepatoma Protein : Plasma Protein as a Precursor of (Dr. P. N. Campbell, H. E. H. Jones and Nancy E. Stone), 138
Liver Cells of Depancreatized Baboons : Nuclear Vacuolation in the (Prof. Joseph Gillman and Christine Gilbert), 656
Liver Dehydrogenase Activity in Rats : Effect of Vitamin B_1- Deficiency on (M. Sreenivasa Murthy, H. S. R. Desikachar and M. Swaminathan), 750
Livers (Rat) Preparation of Cell Suspensions from (Dr. I S. Longmuir and Mrs. Wendy ap Rees), 997
Liversidge, Joan : Furniture in Roman Britain, *review* by W. F. Grimes, 547
Livestock : Grassland and the Feeding of (Nutrition Society Symposium on), 1113
Living Forms : Regularity and Consistency of Design in (Dr. P. Weiss), 1157
Living Mammals of the World (Ivan T. Sanderson), *review* by R. W. Hayman, 445
Living and Fossil Pollen from Macquarie Island (John Bunt), 339
Llowarch, W . Detection and Development of Scientific Ability, 824
Lloyd, C W. : The Neurohypophysis, 1020
Lloyd, E. (Lewis, J F., and) : Electrical Equipment of Aircraft, 1211
Lloyd, Dr. P F Connective Tissue and its Changes with Age, 467
Lloyd, R C. (Edmunds, W. T., and) : Given a Capper Pass Award for 1955 by the Institution of Mining and Metallurgy and the Institute of Metals, 363
Lloyd-Jacob : Hon. Mr. Justice : *Obituary* of Horatio Ballantyne, 556
Lloyd-Jones, C P., and others . Some Problems associated with Determining Iron in Plants, 336
Loads (Random) : Fatigue of Metals under (A. K. Head and F. H. Hooke), 1176
Lobachevski and Non-Euclidean Geometry, 312
Localization (Histochemical), of Alkaline Phosphatase in the Cell Wall of *Chlorella vulgaris* An Electron Microscopical Study of the (Dr. D. Brandes and Dr. R. N Elston), 274
Localization and Measurement (Autoradiographic), of Intracellular Antibody, using Labelled Antigen (Dr. M. C. Berenbaum), 46
Locke, Arthur S., and collaborators : Guidance, *review* by Prof. A. Porter, 1003
Locket, Dr. S., and others : New Series of Ganglion-blocking Agents, 523
Lockhart, I. M. : Paper Chromatographic Identification of the 2 : 4-Dinitrophenyl-Derivatives of Aliphatic Amines, 393
Lockhart, jun., L B., and others : Relationship between Air Concentration of Radioactive Fission Products and Fallout, 990
Lockspeiser, Sir Ben . Elected president of the European Organization for Nuclear Research, 117
  Retirement as secretary of the Committee of the Privy Council for Scientific and Industrial Research, 260 , work of, 260
Locomotion of Worms (W. B Yapp), 614 , (Dr. Betty I. Roots), 615
Locomotory Muscles in the Cockroach : Physiology of the (G. Becht and Dr. D Dresden), 836
Loeser (Guenter) Memorial Lecture of the Geophysics Research Directorate of the Air Force Cambridge Research Center (Dr. Robert G. Breene, jun.), 922
Lofts, B. (Marshall, Dr. A J., and) : The Leydig-cell Homologue in certain Teleost Fishes 704
Logan, Dr. D. W. : The Age-Group Bulge and Its Possible Effect on University Policy, 115
Logarithmic Notation in Science and Engineering : Use of (Prof. S. Devons), 373
Lomer, Dr. W M. : Mechanism of Phase Transformations in Metals, 420
London : Buried—Mithras to the Middle Ages (William Thomson Hill), *review* by W F Grimes, 547
  Exhibition of Scientific Instruments in, 312, 968
  Suicide in—an Ecological Study (Peter Sainsbury), (Institute of Psychiatry, Maudsley Monographs No. 1), *review*, 404
London Hospital Medical College : Appointment of Prof. E. M. Glaser to the University of London readership in physiology, 779
London School of Economics and Political Science Retirement of Sir Alexander Carr-Saunders from the directorship, 689
  Appointment of Sir Sydney Caine as director, 689.
London School of Hygiene and Tropical Medicine : Appointment of Dr. J H Birkinshaw to the University of London chair of biochemistry, 1017, 1109
  Retirement of Prof. Harold Raistrick from the University of London chair of biochemistry, 1108
London and Home Counties Regional Advisory Council for Higher Technological Education Booklet on Advanced Courses in Technology, 364
  Seventh Annual Report, 691
Long Ashton Research Station : Report for 1954 (Dr. John Grainger), 322
Long-Chain Fats : Synthesis of, by Bacteria isolated from Human Fæces (Dr H G Sammons, D J Vaughan and A C. Frazer) 237
Long-Distance Migration in Petrels Moult Adaptation in relation to (Dr. A J. Marshall and D. L. Serventy), 943
Longitudes, Bureau des : Annuaire pour l'an 1956, avec un Supplément pour l'an 1957, *review*, 909
Longmuir, Dr I. S., and Rees, Mrs. Wendy ap : Preparation of Cell Suspensions from Rat Livers, 997
Longuet-Escard, Mme. J : Semi- and Non-Crystalline Materials, 122
Longuet-Higgins, Prof. H. C. : Appointed Arthur D. Little visiting professor of chemistry in the Massachusetts Institute of Technology, 653
Longuet-Higgins, Dr. M. S. : Statistics and Aerodynamics of the Sea Surface, 62
Longwell, Dr. J. : Iodine and Fluorine in Nutrition, 913
Lonsdale, Dame Kathleen : Low-Temperature Crystallography, 1067
Lonsdale, Dame Kathleen, and Grenville-Wells, Dr. H Judith : Anisotropic Temperature Factors in Cubic Crystals, 986
Lora-Tamayo, Prof M. : Documentation of Applied Chemistry, 169
Lorand Dr. L, and Moos C. : Auto-oscillations in Extracted Muscle Fibre Systems, 1239
Lorch, W F. : Will Ion Exchange replace the Laboratory Still ?, 509
Lord, A. V., and others : The Suppressed Frame System of Telerecording, 519
Lord, E : Properties and Distribution of Raw Cotton, 74
Losee, Dr. Fred L, and Hurley, Lieut. Lloyd A. : Bone treated with Ethylenediamine as a Successful Foundation Material in Cross-Species Bone Grafts, 1032
Lothe, F Appointed pathologist, Medical Department, Uganda, 70
Loughhead, R E (Jefferies, J T, and) Correlation Patterns in the Chromospheric Granulation 180
Loughnane, J. B. and others : Virulent Attacks of Eyespot on Oats, 193
Lousley, J. E. : The British Flora during 1955, 18
  Progress in the Study of the British Flora, 1162
Loutit, Dr J. F., and others : Cytological Identification of Radiation-Chimæras, 452
Lovern, Dr. J. A : Phospholipids in Foods, 565
  The Chemistry of Lipids of Biochemical Significance, *review* by Prof. A. C. Frazer, 1050
Lovlie, A. M, and others : Length of the Muscle Fibres of the Rat Diaphragm, 581
Low Audio-frequency Electromagnetic Signals of Natural Origin (R. E. Holzer and O. E. Deal), 536
Low-alloy Steels : Hair-line Cracks in (A Barker and A Wainwright), 1136
Low-Conductance Surface Membrane in *E coli* . A Dielectric Study of the (Dr Hugo Fricke, Herman P. Schwan, Kam Li and Vernon Bryson), 134
Low-frequency Atmospheric Noise during the Cosmic-Radiation Storm of February 23 Sudden Decrease in (C. A. McKerrow), 1223
Low-Level Neutron Sources : Determination of Chromium, Vanadium and Tungsten by Activation Analysis using (Prof. M. Huaringa), 85
Low-Silica Hydroxide Solutions : Ion-Exchange Preparation of, for Colorimetric Determinations of Total Silica (Sallie Fisher and Robert Kunin), 1125
Low-Temperature Crystallography (X-Ray Analysis Group of the Institute of Physics and the Low-Temperature Group of the Physical Society Conference on), 511, 1067
Low Temperatures : Thermal Conductivity of Solid Argon at (Dr. G. K. White and Dr. S B Woods), 851
Lowick, J H B., and others : Differences between the Electrical Charge carried by Normal and Homologous Tumour Cells, 576
Lowndes, Dr. A G. : Swimming of Fishes, 194
  Obituary by Prof J Z Young, 826

Mechanics . Simon Stevin, a Founder of, *review* by Prof E. N da C. Andrade, 3
Mechanics (Applied) : Ninth International Congress of, 653
Mechanics (Theoretical) : Introduction to (Prof. Robert A Becker), *review*, 352
Mechanics (Theoretical and Applied), International Union of, and International Astronomical Union : I.A.U. Symposium Series, No. 2, Gas Dynamics of Cosmic Clouds—a Symposium held at Cambridge, July 6–11, 1953 (edited by H. C. van de Hulst and J. N. Burgers), *review* by Dr. F D. Kahn, 352
Mechanism of Anorexia in Vitamin-deficient Hyperphagic Animals (Dr L. R. C. Agnew and Jean Mayer), 1235
Mechanism of Evolution (W. H Dowdeswell), *review* by Dr. Maurice Ashby, 864
Mechanism of Inactivation of Tobacco Mosaic Virus by X-rays (Max A. Lauffer, David Trkula and Anne Buzzell), 890
Mechanism of Phase Transformations in Metals (Metal Physics Committee of the Institute of Metals Symposium on), 419
Mechanism of the Phenyl *Iso*thiocyanate Degradation of Peptides (Pehr Edman), 667
Mechanisms of Hearing and Balance, 1063
Medalia, A. I., and others : Emulsion Polymerization, *review* by Prof. G. Gee, 297
Medawar, Prof. P. B : Immunological Tolerance, 869
Medical Bulletin, British, Vol. 12, No 1, Memorial Number to Sir Edward Mellanby (British Council), 314
  Vol. 12, No. 2, Symposium on Neuro-Otology (British Council), 1063
Medical Department, Jamaica : Appointment of T. L Gracey as assistant bacteriologist, 70
Medical Department, Uganda : Appointment of F. Lothe as pathologist, 70
Medical Education in the United States : Grants for (Commonwealth Fund, New York), 1064
Medical Education and Public Health : Fellowships in (Rockefeller Foundation Awards), 977
Medical Research Beit Memorial Fellowship Awards, 965
  Grants-in-aid for (Life Insurance Medical Research Fund of Australia and New Zealand), 511
  Humanity's Rising Debt to (Sir Henry Dale), 362
Medical Research and its Benefit to Humanity, 362
Medical Research Council : Fellowships in Clinical Research, 70
  Rockefeller, Eli Lilly and Lederle Travelling Fellowships in Medicine, 215
  Dorothy Temple Cross Research Fellowships in Tuberculosis, 215
  Memorandum No 31, Psychological Tests for Accident Proneness and Industrial Proficiency (E. G. Chambers), 313
  Scholarships to British workers in Medical Science, on behalf of the Centre National de la Recherche Scientifique, 415
  Appointment of Miss N. M Goodman to the Mapother Bequest Research Fellowship for 1956–57, 464
Medical Science : Scholarships to British workers in (Medical Research Council, on behalf of the Centre National de la Recherche Scientifique), 415
Medical Tables, Part I, for 1954 (General Register Office), 313
Medicine : Autoradiography in Biology and (Prof. George A. Boyd), *review* by Prof. John E. Harris, 402
  Lederle Travelling Fellowships in (Medical Research Council), 215
  Eli Lilly Travelling Fellowships in (Medical Research Council), 215
  Fellowships in Biology and (Rockefeller Foundation Awards), 977
  Research Films in Biology, Anthropology, Psychology and (Anthony R. Michaelis), *review* by Prof. G E. H. Foxon, 298
  Rockefeller Travelling Fellowships in (Medical Research Council), 215
  A Short History of (Prof. Erwin H Ackerknecht), *review* by Dr. Charles Singer, 909
Medicine, Royal Society of (Section of Comparative Medicine) : Discussion on Learning in Man and Animals, 1147
Medicine, Royal Society of (Section of Experimental Medicine and Therapeutics) : Symposium on Anti-tumour Agents, 511
Medicine (Aviation) : Collected Papers on (Presented at Aeronautical Panel Meetings of the Advisory Group for Aeronautical Research and Development, Paris), *review* by Wing-Comdr F. Latham, 57
Medium (A Selective), for the Isolation of Basidiomycetes (P. Russell), 1033
Medlock, R. S Automatic Control in the Process Industries, 254
Meehan, E J., and others : Emulsion Polymerization, *review* by Prof. G. Gee, 297

Mees, Dr. C. E. K · Retirement as vice-president in charge of research of the Eastman Kodak Company, 360 ; work of, 360
Megaw, Dr. E. C. S. *Obituary* by Dr. R. L. Smith-Rose, 409 , *obituary* by Dr. H. F. Willis, 410
Megaw, Dr. H D., and Kelsey, C. H. : Crystal Structure of Tobermorite, 390
Meggy, Dr. A. B. : Electron Microscopy of Fibres, 319
Meggy, Dr. A. B., and Sikorski, Dr. J · Dimorphism of Polyglycine, 326
Megson, Dr. N. J. L. . Epoxide Resins, 962
Mehta, Dr. T. R : The Genotype in Agriculture (Presidential Address to the Indian Society of Genetics and Plant Breeding), 214
Meiklejohn, Dr. Jane : Primeval Microbes, *review*, 809
Meisel, S. L. (Hartough, Howard B., and) : Compounds with Condensed Thiophene Rings, *review*, 403
Meissner, K. W., and Finckh, E. C. : Spectroscopy, 738
Melanin : Effect of Copper Cyanide upon the Formation *in vitro* of (Saburo Isaka and Miki Akino), 184
Meldola Medal for 1955 of the Society of Maccabæans awarded to Dr. Peter Gray, 507
Meles meles L. Ovulation during Delayed Implantation and other Reproductive Phenomena in the Badger (Prof. R. J. Harrison and E. G. Neal), 977
Melibiase and Galactozymase : Complementary Action of, on Raffinose Fermentation (Prof Ö. Winge and Dr. Catherine Roberts), 383
Mellanby, Sir Edward : Vitamins—Memorial Essays to, 314
Mellon, Dr. M. G. : Documentation of Applied Chemistry, 168
Mellon Institute of Industrial Research, Pittsburgh Retirement of Dr. E. R. Weidlein from the presidency, 733
Mesloidogyne acronea, a New Species of Root-Knot Nematode (Dr. V. Coetzee), 899
Melting, Diffusion and related topics (Low Temperature and Solid State Physics Group of the Division of Pure Physics of the National Research Council of Canada Symposium on), 23
Melville, A. R · Appointed chief research officer, Agricultural Department, Kenya, 831
Melville, Prof. H. W. ; Appointed secretary of the Department of Scientific and Industrial Research, 260 ; work of, 260
  Crystallization of High Polymers, *review*, 640
Melville, Prof. H. W., and others : New Methods of Preparing Block Copolymers, 910
Melville, Dr. James · Appointed director of the Waite Agricultural Research Institute of the University of Adelaide, 689
Membranes (Ion-Exchange) · Electrolytic Desalting with (Dr. J. D. Blainey and H J Yardley), 83
Men (Good) The Education of (M L. Jacks), 150
Men (South African Bantu) : Reduction to Normal Levels of the High Erythrocyte Sedimentation-Rates in Apparently Healthy (A. R. P. Walker, D. C. Fletcher, P. A. Reynolds, I Bersohn and E. D. Sonnenfeld), 480
Mendelssohn, Dr. K. . Low-Temperature Crystallography, 1067
Mental Hospital · The (Dr. Alfred H. Stanton and Dr. Morris S. Schwartz), *review* by Dr. G. M. Carstairs, 250
  Social Analysis of Life in a, *review* by Dr. G. M. Carstairs, 250
Mentality : The Imitation of (Dr. W. Grey Walter), 684
Mentzer, C. · Chemistry of Oxygenated Heterocyclic Compounds, 1116
Mer, G. G , and others Substituted Benzenesulphonanilides as Synergists for DDT, 800
Mercer, E H. Electron Microscopy of Fibres, 319
Merck Institute for Therapeutic Research, 828
Meredith, Prof. G. Patrick . Talking about Communication, *review*, 446
Mering, J. : Semi- and Non-Crystalline Materials, 122
Merrill, Prof. E. D. : *Obituary* by I. H Burkill, 687
Meson Physics (Nuclear and) · Proceedings of the 1954 Glasgow Conference on (edited by E. H. Bellamy and R. G. Moorhouse), *review* by Dr. J. C. Bower, 154
Mesoplodon stejnegeri : Skull of a Beaked Whale, received by the British Museum (Natural History), from the Malacca Museums Board, 215
Mesrobian, Robert B. (Robolsky, Arthur V., and) : Organic Peroxides, *review* by Dr. G. M. Bennett, 814
Metabolism : Fat—a Symposium on the Clinical and Biochemical Aspects of Fat Utilization in Health and Disease (edited by Victor A. Najjar) *review* by Prof. A. C. Frazer, 1050
  Genetics and (Robert P. Wagner and Herschel K. Mitchell), *review* by Prof. J. B. S. Haldane, 905
Metabolism of Skin : Phospholipid (W. K. Berry), 789
Metabolism of Sorbitol (L. H. Adcock and Prof. C H Gray), 329
Metabolism (Amino-acid), of *Nicotiana* Leaves after Removal from Plant (Shri Ranjan and M. M. Laloraya), 235
Metabolism (Carbohydrate) : Glucagon and the Regulation of (Dr. H. Elrick), 892
Metabolism (Endogenous) : 3-Hydroxyanthranilic Acid, a Carcinogen produced by (Prof. E. Boyland and G. Watson), 837
Metabolism (Tyrosine) : A Requirement for Catalase in—the Oxidation of *p*-Hydroxyphenylpyruvic Acid to Homogentisic Acid (Dr. Bert N. La Du and Vincent G. Zannoni), 574
Metabolites (Mould) : Antibiotics and (Chemical Society Symposium on), 562, 1058
Metal: Purification of a, by Zone-refining one of its Salts (J L. Richards), 182
Metal Complexes studied Polarographically : Formation and Reduction of Zero-Valent (Dr. A. A. Vlček), 1043
Metal Ion Catalysis and Polarity of Environment in the Aerobic Oxidation of Unsaturated Fatty Acids (Dr. N. Uri), 1177
Metal Salts : Termination of Chains in Vinyl Polymerization by (Dr. E. Collinson and Prof. F. S Dainton), 1224
Metal Whiskers (Dr J. Franks), 984
Metal-catalysed Hydrolysis of Thiophosphoric Esters (Prof. J. A A Ketelaar, H. R. Gersmann and Miss M. M. Beck), 392
Metallic Ions and Organic Radicals in Plant Materials : Microwave Detection of (Howard Shields, William B. Ard and Prof. Walter Gordy), 984
Metallo-Enzymes . Models for (Dr R. J P. Williams), 304
Metallographic Evidence of Mechanical Twinning in an Alpha-Beta Titanium Alloy (Dr. D. N. Williams), 436
Metallurgy : Capper Pass Awards for Papers on (Institution of Mining and Metallurgy and the Institute of Metals), 68, 363
Metallurgy at Oxford . Expansion of, 1156
Metallurgy at University College, Swansea, 411
Metallurgy (Industrial), in Birmingham, 605
Metallurgy (Physical), at the Imperial College, London, 559
Metals . Avidity of the Tetracyclines for the Cations of (Prof. Adrien Albert and C. W. Rees), 433
  The Corrosion of, and its Prevention (Education Panel of the Corrosion Group of the Society of Chemical Industry Prize for an essay or paper on), 17
  The Fracture of (Prof. N. F. Mott), 692
  Mechanism of Phase Transformations in (Metal Physics Committee of the Institute of Metals Symposium on), 419
  The Possible Uses of Surface Methods as a Means of Testing (with Special Reference to Optical Methods), (Non-Destructive Testing Group of the Institute of Physics Symposium on), 564
  Superficial Reactions of Gases on (Annual Meeting of the Société de Chimie physique), 693
  Use of Capacity Measurements for the Study of Oxide Films on (J. N. Wanklyn), 849
Metals, Institute of : Medal Awards, 16
  Election of Dr. R. A. Wilkins as a Fellow, 922
Metals, Institute of (Metal Physics Committee) : Symposium on the Mechanism of Phase Transformations in Metals, 419
Metals, Institute of (Institution of Mining and Metallurgy and the) : Capper Pass Awards for Papers on Metallurgy, 68, 363
Metals Reference Book (Dr. Colin J. Smithells), second edition, *review* by A R. Bailey, 642
Metals under Random Loads : Fatigue of (A. K. Head and F. H. Hooke), 1176
Metals (Light) International Convention on, 736
Metals (Polycrystalline) : Relation between the Initial Instantaneous Extension in Creep and the Yield Stress and Coefficient of Work-hardening in (Dr. Paul Feltham), 632
Metaphosphate Glass : Colour Centres in (James H. Schulman), 287 , (Sadhan Basu), 287
Metaphysical Strain in Kant, *review* by Prof. L. J. Russell, 152
Metaphysics of Science (Dr. C. K. Grant), 369, 998 ; (Prof. Reginald O Kapp), 997
Metaphysics and Theory of Science : Kant's (Prof. Gottfried Martin), translated from the German by P. G. Lucas, *review* by Prof. L. J. Russell, 152
Metcalfe, Dr. C. F. : Microscopy of Vegetable Foodstuffs, *review*, 863
Meteorites : Meaning of Deuterium Abundance in (Dr. Giovanni Boato), 424
Meteorites (Iron) : Radioactivity of, by the Photographic Method (S. Deutsch, Dr. E. Picciotto and Prof. F. G. Houtermans), 885
Meteorological Analysis : Principles of (Walter J. Saucier), *review* by Dr. J. M. Stagg, 956
Meteorological Office : Publication 588, British Rainfall during 1953 (Ninety-third Annual Volume of the British Rainfall Organization), 313
  Annual Report of the Director for 1954–55, 519
  Geophysical Memoir 96, The Free Atmosphere in the Vicinity of Fronts, —Analysis of the Observations by the Meteorological Research Flight 1950–52 (J. S. Sawyer), 656
Meteorological Office and the Central Office of Information : Your Weather Service, revised edition, 1158
Meteorological Research at Porton (Dr. F. Pasquill), 1148
Meteorological Research Flight : The Free Atmosphere in the Vicinity of Fronts—Analysis of the Observations by the, 1950–52 (J. S. Sawyer), 656
Meteorological Service of Pakistan : Geophysical Review, Part 4, Technical Progress Review No. 7 (Geophysical Research in Pakistan), 1158
Meteorological Society, Royal : Symposium on Turbulence in the Atmosphere, 13
  Symposia on Statistics and Aerodynamics of the Sea Surface, 62
  Prize for an essay on the Place of Meteorology in Liberal Education, 415
  Awards, 1014
  Summer Meeting, 1065
  Napier Shaw Memorial Prize awarded to Dr. Norman A. Phillips, 1203
Meteorological Society Royal, and the British Glaciological Society . Discussion on Snow Accumulation and Ablation, 563
Meteorological Society, Royal (Field Studies Council and the) · Vacation Course in Meteorology, 922
Meteorological Society, Royal (Physical Society and the) : Conference on Cloud Physics, 320
Meteorological Society (Scottish) : Centenary of the Former, 371
Meteorology : Structure of Fronts in, 656
  Vacation Course in (Field Studies Council and the Royal Meteorological Society), 922
Meteorology of the Falkland Islands and Dependencies (J. Pepper), review, 448
Meteorology in Liberal Education : The Place of (Royal Meteorological Society Prize for an essay on), 415
Meteorology and Geographical Features of the Antarctic, 508
Methanesulphonate (2-Chloroethyl), in *Drosophila melanogaster* : Mutagenicity of (O G. Fahmy and Myrtle J. Fahmy), 996
Methionine : Effect of Supplementary Choline and, on the Response of Chickens to Folic Acid (M. W McDonald), 343
Method for Determining the Duration of Action of the Cardiac Glycosides (M. Rand and Anne Stafford), 278
Method (A Direct), for the Measurement of Cerebral Blood-flow (D. H. Ingvar and U Soderberg), 339
Method (A Modified), of Two-Dimensional Zone Electrophoresis applied to Mucoproteins in Serum and Urine (R. L. Markham), 125
Method (A New), of Analysing Ionospheric Movement Records (Dr. G. L Rogers), 613
Method (A New), for Determining Ketohexoses in the presence of Aldohexoses (M. A. Jermyn), 38
Method (A New Quantitative), for Antigen-Antibody Titrations in Gels (Dr. Joseph G. Feinberg), 530
Method (A Photographic), for the Study of Insect Migration (H. J. Sayer), 226

Method (A Radiographic), for the Study of the Function of the Cow's Udder (Dr. J. Bilek and Dr. M. Janovsky), 582
Method (A Rapid), for Permanent Aceto-Carmine Squash Preparations (Dr. J. A. Rattenbury), 1185
Method (A Simple), of Assessing the Moisture exuded through the Skin of Cattle (R. M. Mabon), 284
Method (A Simple), of Studying Winds in the Ionosphere by using Continuous-Wave Radio (Dr. B. Ramachandra Rao and D. Satyanarayana Murty), 1222
Method (A Slide-trap), for the Isolation of Soil Fungi (Geoffrey W. F. Sewell), 708
Method (Spectrophotometric), for the Estimation of Vitamin K_3 (Vanamala Sathe, J. B Dave and Dr. C. V. Ramakrishnan), 276
Methods in Enzymology (edited by Sidney P. Colowick and Nathan O. Kaplan), Vol. I, Preparation and Assay of Enzymes, *review* by Dr. J. R. Turvey, 810
Methods of Materials Testing : American, *review* by K. J. Pascoe, 248
Methods of Quantitative Micro-Analysis (collected and edited by Dr. R. F. Milton and Dr. W. A. Waters), second edition, *review* by E. Q. Laws, 153
Methods (New), in Astronomy, *review* by Dr J S Hey, 299
Methods (New), of Preparing Block Copolymers (P. E. M. Allen, J. M. Downer, G. W Hastings, Prof. H. W. Melville, P. Molyneux and J R. Urwin), 910
Methods (New), of School Teaching in Australia, *review*, 250
Methods (New), for the Synthesis of Peptides (Dr. J. Kollonitsch, V. Gábor and A. Hajós), 841
Methods, Materials and Processes involved in the Uses of High Temperatures in Science and Industry (Stanford Research Institute and the University of California Symposium on), 693
ββ-Methylethyl Glutarimide and Amytal · Effect of, on Rat-Liver Mitochondrial Respiration (Prof. O. Jalling), 330
I-Methylhistidine . Discoloration of Muscle Preparations from Codling (*Gadus callarius*) by Degradation Products of (Dr. N. R. Jones), 748
Metzger, Walter P. (Hofstadter, Prof. Richard, and) : The Development of Academic Freedom in the United States, *review* by R. Brightman, 1190
Meudt, Werner, and others : A New Unidentified Indole Hormone in Maryland Mammoth Tobacco, 890
Mexico : Mosquitoes of North America, North of (Stanley J. Carpenter and Walter J. La Casse), *review*, 56
Meyer, Dr. J M. : Documentation of Applied Chemistry, 168
Meyrick, Edward · Catalogue of the Type Specimens of Microlepidoptera in the British Museum (Natural History) described by (J. F. Gates Clarke), *review* by Dr. G. C Varley, 1005
Mice (House-) : Populations of (R. L. Strecker and John T. Emlen, jun.), 692
Mice (Immature), treated with Gonadotrophins : Viability and Developmental Capacity of Eggs from (Allen H. Gates), 754
Mice (Obese-Hyperglycæmic) . Effects of Pituitary Growth Hormone on the Insulin and Hyperglycæmic-glycogenolytic Factor extractable from the Pancreas of (Dr. D. W. Clarke, Dr. G. A. Wrenshall and Dr. J. Mayer), 1235
Michaelis, Dr. Anthony R. · Research Films in Biology, Anthropology, Psychology and Medicine, *review* by Prof. G E H. Foxon, 298
  Appointed editor of *Discovery*, 311 , work of, 311
Michaelson, Prof I. C., and others : *ABO* Antigens in the Human Cornea, 840
Michelangelo, a Study in the Nature of Art (Adrian Stokes), *review* by F. I G. Rawlins, 451
Michotte, Prof A. E. · Elected a Foreign Associate of the National Academy of Sciences, Washington, 926
Micro-analysis by a Flying-Spot X-Ray Method (Dr. V. E. Cosslett and P. Duncumb), 1172
Micro-Analysis (Quantitative) : Methods of (collected and edited by Dr. R. F. Milton and Dr. W. A. Waters), second edition, *review* by E. Q. Laws, 153
Micro- or Macro-Dialyser : A Rapid Variable-Temperature (Dr. H Stegemann and Dr G Toennies), 440
Microbes Primeval, *review* by Dr. Jane Meiklejohn, 809
Microbiologia, Giornale di : New Italian Journal of Microbiology, 652
Microbiologie, Association Internationale des Sociétés de (Section de Microbiologie des Produits Alimentaires) : Ier Symposium International de Bactériologie Alimentaire, Lille, 1954, Bactériologie des Semi-Conserves de Viandes—Rapports, Communications et Discussions, *review* by Dr. M. Ingram, 6
Microbiology . General (Prof. William G. Walter and Prof. Richard H. McBee), *review* by T. H. Hawkins, 107
Microbiology in the Arctic and other Regions : Recent Soviet Research on (W. G Cass), 654
Microbiology of Silage (Kathleen J. Anderson), 96
Microchemistry : Extension of, *review* by Prof. F. A. Paneth, 953
Microlepidoptera in the British Museum (Natural History) described by Edward Meyrick · Catalogue of the Type Specimens of (J F. Gates Clarke), *review* by Dr. G. C. Varley, 1005
Micro-organism of Racemic Diaminosuccinic Acid : Resolution by means of a, and Determination of its Configuration (Sakaru Suzuki, Hisao Makishima and Noboru Suzuki), 280
Micro-organisms : Bacterial Variation to Sensitivity, an Example of Individuality in (Dr. W Howard Hughes), 1132
  Formation of Iron-binding Compounds by (J. A. Garibaldi and Prof. J. B. Neilands), 526
Micro-organisms (Fæcal), of Parabiotic Rats (Dr. Helen R. White), 751
Microphone for Broadcast Transmission : Design of a Ribbon Type Pressure-Gradient (D. E. L Shorter and H D Harwood), 519
Microradiography : X-Ray Microscopy and (International Union of Pure and Applied Physics Symposium on), 1065
Microscope · The Flying-Spot Monochromatic Ultra-Violet Television (P. O'B. Montgomery, F Roberts and W. Bonner), 1172
Microscope à Contraste de Phase et le Microscope Interférentiel (Maurice Françon), *review*, 680
Microscope Interférentiel : Le Microscope à Contraste de Phase et le (Maurice Françon), *review*, 680
Microscopical Society, Royal (Industrial Section) : Symposium and Exhibition on Fibre Microscopy, 515
Microscopy : Fibre (Industrial Section of the Royal Microscopical Societ Symposium and Exhibition on), 515
  Nomenclature in (Dr. John R. Baker), 194
Microscopy of Ceramics and Cements, including Glasses, Slags and Foundry Sands (Herbert Insley and Prof. Van Derek Fréchette), *review* by Dr. W. Campbell Smith, 640
Microscopy of Vegetable Foodstuffs, *review* by Dr. C. R Metcalfe, 863
Microscopy and Microradiography . X-Ray (International Union of Pure and Applied Physics Symposium on), 1065
Microstructures of Diamond Surfaces (Prof. S. Tolansky), *review* by Dr. J. W. Mitchell, 1193
Microwave Detection of Metallic Ions and Organic Radicals in Plant Materials (Howard Shields, William B. Ard and Prof. Walter Gordy), 984
Microwave Frequencies : Spectroscopy at Radio and (Dr D. J. E. Ingram), *review* by Dr. D. M. S. Bagguley, 1099
Microwave Observation of Detonation (Dr. John L. Farrands and G. F. Cawsey), 34
Microwave Spectroscopy (Prof. C. H. Townes and A. L. Schawlow), *review* by Dr. D. M. S. Bagguley, 1099
Middle East : Old Akkadian Tablets from the (Prof. Ignace J. Gelb), 735
Migration of Nematodes (H. R. Wallace), 287
Migration (Insect) : A Photographic Method for the Study of (H. J. Sayer), 226
Migration (Long-distance), in Petrels : Moult Adaptation in relation to (Dr. A. J. Marshall and D. L. Serventy), 943
Mika, Dr. T. F. . Epoxide Resins, 963
Mikrochemie : Messung Radioaktiver Strahlen in der (Dr. T. Bernert, Dr. B. Karlik und Dr. K. Lintner), *review* by Prof. F. A. Paneth, 953
  Radiochemische Methoden der—Verwendung der Radioaktivitat in der Microchemie (Dr. E. Broda und Dr. T. Schonfeld), *review* by Prof. F. A. Paneth, 953
  Verwendung der Radioaktivität in der—Radiochemische Methoden der Mikrochemie (Dr. E. Broda und Dr. T. Schonfeld), *review* by Prof. F. A. Paneth, 953
Mikrochemischen Methoden : Handbuch der (herausgegeben von Prof. Friedrich Hecht und Prof Michael K. Zacherl), Band 2, Verwendung der Radioaktivität in der Mikrochemie ; Radiochemische Methoden der Mikrochemie (Dr. E. Broda und Dr. T. Schonfeld) ; Messung Radioaktiver Strahlen in der Mikrochemie (Dr. T. Bernert, Dr. B. Karlik und Dr. K. Lintner) ; Photographische Methoden in der Radiochemie (Dr. H. Lauda), *review* by Prof. F. A. Paneth, 953
Mikroskopische Untersuchung pflanzlicher Nahrungs- und Genussmittel (Dr. Gustav Bothe), dritte Auflage, *review* by Dr. C. R. Metcalfe, 863
Milgrom, F., and others : Preparation of Antiglobulin Sera, 329
Milk Products · New Amino-Acid—Glycosides isolated from Tryptic Hydrolysates of (Susumu Adachi), 936
Mill (Hugh Robert) Medal and Prize for 1956 of the Royal Meteorological Society awarded to J. S Sawyer, 1014
Millar, Dr. R H. : Elected a Fellow of the Royal Society of Edinburgh, 506
Millard, Walter Samuel (Blatter, Ethelbert, and) · Some Beautiful Indian Trees, second edition, revised by William T. Stearn, *review* by N. L. Bor, 680
Millbank, J. W. : Estimation of Numbers of *Nitrosomonas* in Soil and Culture, 848
Millen, T S., and Page, R S. Fibre Microscopy, 516
Miller, Prof. C. P. : Elected a Member of the National Academy of Sciences, Washington, 926
Miller, D. G., and others · Spectroscopy, 738
Miller, Dr. J. C. P. : Numerical Analysis, *review*, 953
Miller, Prof. R. : Elected a Fellow of the Royal Society of Edinburgh, 507
Miller, Prof. R. B. . Appointed a member of the National Research Council of Canada, 830
Miller, W. F., and Platzman, R. L. · Spectroscopy, 738
Millns, P. Y. · *Obituary* by Prof. Zdenek Kopal, 164
Milloux, Prof. H. : Elected a *corrrespondant* for the Geometry Section of the Paris Academy of Sciences, 1062
Millport Marine Station . Retirement of E. Ford from the directorship, 605
  Appointment of Dr. C H. Mortimer as director, 605
Mills, B. Y., and others : Absorption of 3 5-m. Radiation in the Optical Emission Nebula, *NGC* 6357, 178

Nečas, O. : Regeneration of Yeast Cells from Naked Protoplasts, 898
Nederlandsche Natuurkundige Vereniging : International Conference on Nuclear Reactions, 693
Need for Observations in the Older Branches of Astronomy, especially Double Stars (Dr. J. Jackson), 975
Needham, Dr. Joseph, and others : Chinese Astronomical Clockwork, 600
Needham, Prof. James G., and Westfall, Jr., Prof. Minter J. : A Manual of the Dragonflies of North America (Anisoptera), *review* by D. E. Kimmins, 450
Neeman, M., and others : Substituted Benzenesulphonanilides as Synergists for DDT, 800
Neilands, Prof. J. B. (Garibaldi, J. A., and) : Formation of Iron-binding Compounds by Micro-organisms, 526
Neill Prize for 1953–55 of the Royal Society of Edinburgh awarded to Dr. Robert Osborne, 507
Neilsen, Dr. K. O. : Production and Utilization of Electromagnetically Enriched Isotopes, 158
Neilson, A H., and others : Hydrolysis of Esters of Monoribonucleotides, 1124
Nel, Dr. Louis T. : *Obituary* of Dr. A. L. Hall, 409
Nelken, Dr. D., and others : *ABO* Antigens in the Human Cornea, 840
Nelken, Dr. E., and others : *ABO* Antigens in the Human Cornea, 840
Nelson, Sir George : Digital Computer Techniques, 1069
  Electrical Equipment of Aircraft, 1210
Nematode : The Reniform, in the Gold Coast (F. C. Peacock), 489
Nematode (Root-Knot) : *Meloidogyne acronea*, a New Species of (Dr. V. Coetzee), 899
Nematode Larvæ parasitic in the Horse : Effect of a Coliform Organism (*Escherichia*) on the Second Ecdysis of (D. Poynter), 481
Nematodes · Migration of (H. R. Wallace), 287
Nematodes (Plant) · 'Solubilized' Chemicals for the Control of (L. N. Staniland), 97
Nematodes (Soil) : Lactophenol Preparations for (C. K. Capstick), 896
Nematologica, Vol 1, No. 1, 874
Nephelometric Methods : Colorimetric Methods of Analysis, including some Turbidimetric and (Dr. Foster Dee Snell and Dr. Cornelia T. Snell), Vol. 3, Organic (1) ; Vol. 4, Organic (2), *review* by J. King, 201
Nerve Cells : Quantitative Determination of Acetylcholinesterase Activity in Individual (Dr. Ezio Giacobini and Dr. Joseph Zajicek), 185
Nervous System (Central) : Biochemistry and the (Prof. Henry McIlwain), *review* by Dr. G. B. Ansell, 720
Nervous System of the Frog : Pseudo-Cholinesterase in the Central (D. C. Hardwick and Dr. Catherine Hebb), 667
Ness (Mrs. Patrick) Award for 1956 of the Royal Geographical Society awarded to Robert Dovers, 606
Netherlands Red Cross Blood Transfusion Service : Publication of *Vox Sanguinis* transferred to S. Karger, Basle, 215
Neumann, R. · Automatic Regulation, *review*, 766
Neurochemistry, *review* by Dr. G. B. Ansell, 720
Neurochemistry (edited by K A. C. Elliott, Irvine H. Page and J. H. Quastel), *review* by Prof J. N. Davidson, 811
Neurohypophysis : International Symposium on the (Colston Research Society and the University of Bristol), 561, 1019
Neurones : Changes in the Dimensions of Nuclei of, with Activity (Dr. M. R. A. Chance, A. J. Lucas and Dr. J. A. H. Waterhouse), 1081
Neuro-Otology : Symposium on (*British Medical Bulletin*, Vol. 12, No. 2), 1063
Neutron Cross-Sections (prepared by the United States Atomic Energy Commission), *review* by Dr P. A. Egelstaff, 812
Neutron Sources (Low-Level) : Determination of Chromium, Vanadium and Tungsten by Activation Analysis using (Prof. M. Huaringa), 85
Nevens, Prof. William Barbour (Yapp, Prof. William Wodin) : Dairy Cattle, fourth edition, *review* by Arthur S. Foot, 55
Neville-Jones, D. J. : Fresh Water from Salt Water, 270
New Alumina Trihydrate (Robert A. Van Nordstrand, William P. Hettinger and Carl D. Keith), 713
New Amino-Acid—Glycosides isolated from Tryptic Hydrolysates of Milk Products (Susumu Adachi), 936
New Apparatus for Cathode Sputtering (L. Holland), 1229
New Approach to Biosynthesis, *review* by Dr. Kenneth McQuillen, 594
New Aspects of Non-Destructive Testing : Physics of some (Non-Destructive Group of the Institute of Physics Summer Meeting on), 1113
New Avian Schistosomiasis : Nasal Trichobilharziasis, a (Dr. A. Fain), 389
New Cytology : Towards the, *review* by Dr. Laurence Picken, 1146
New Determinations of the Velocity of Light (Colonel R. C. A. Edge), 618
New Developments in Industrial Leadership in Great Britain, the United States, Germany and France (edited by Frank A. Heller), 1001
New Enzyme Aminomalonic Acid Decarboxylase—a (Kensuke Shimura, Hideo Nagayama and Aiko Kikuchi), 935
New Enzymic Digestion Technique · Gelatin Light-scattering, by a (Dr. G. Stainsby), 745
New Germanium Phototransistor, type *OCP71* (Mullard, Ltd.), 830
New Habit among Greenfinches : Diffusion of a (Max Pettersson), 709
New Method of Analysing Ionospheric Movement Records (Dr. G. L. Rogers), 613
New Method for Determining Ketohexoses in the presence of Aldohexoses (M. A. Jermyn), 38
New Methods in Astronomy, *review* by Dr. J. S. Hey, 299
New Methods of Preparing Block Copolymers (P. E. M. Allen, J. M Downer, G W. Hastings, Prof. H. W. Melville, P. Molyneux and J. R. Urwin). 910
New Methods of School Teaching in Australia, *review*, 250
New Methods for the Synthesis of Peptides (Dr. J. Kollonitsch, V. Gábor and A. Hajós), 841
New Muscle Preparation for the Study of Optical Changes during Contraction (Dr. B. C. Abbott and Dr. J. Lowy), 788
New Nature Reserves in England (Nature Conservancy), 611
New Permanent Magnet Materials, 510
New Quantitative Method for Antigen-Antibody Titrations in Gels (Dr. Joseph G. Feinberg), 530
New Research Reactors at Harwell : Two, 165

New Scheme of Qualitative Inorganic Analysis, *review* by Prof. J. R. Partington, 498
New Series of Ganglion-blocking Agents (Dr. D. W. Adamson, J. W. Billinghurst, A. F. Green and Dr. S. Locket), 523
New Solvent for Quantitative Paper Chromatography of Sugars (Dr. Giovanni Giovannozzi-Sermanni), 586
New Species of Root-Knot Nematode : *Meloidogyne acronea*, a (Dr. V. Coetzee), 899
New Stereochemical Arrangements of Divalent Palladium and Platinum : Some (Dr. C. M. Harris, Prof. R. S. Nyholm and N. C. Stephenson), 1127
New Synthesis of Special Relativity, *review* by Prof. H. S. Ruse, 905
New System of Electrification for British Railways (G. H. Platt), 867
New Television Transmitting Station at the Crystal Palace, London, 689
New Theorem in Electrostatics and its Application to Calculable Standards of Capacitance (A. M. Thompson and Dr. D. G Lampard), 888
New Tocopherol in Rice : η-Tocopherol (7-Methyltocol), a (J. Green and S. Marcinkiewicz), 86
New Type of Electron Multiplier : The Gas-Multiplier, a (C. H. Vincent), 391, *erratum*, 415
New Type of Male Fructification referable to *Glossopteris* (J. Sen), 337
New Unidentified Indole Hormone in Maryland Mammoth Tobacco (A. J. Vlitos, Werner Meudt and R. Beimler), 890
New World : A Bathynellid from the (Sebastian J. Gerlach and Rolf Siewing), 289
New X-Ray Data on Coals (L. Cartz, R. Diamond and P. B. Hirsch), 500
New Yarns and Fabrics (Forty-first Annual Conference of the Textile Institute), 693
New Year Honours List, 15
New York Academy of Medicine : Medal awarded to Dr. Eugene Floyd DuBois, 261
    Plaque presented to Dr. Malcolm Goodridge for outstanding services, 261
New Zealand : Frequency Variations in, of 16 kc./s. Transmissions from *GBR* Rugby (A. H. Allan, D. D. Crombie and W. A. Penton), 178
    So-called 'Glacier-Worms' in (Prof. N. E. Odell), 534
    Soil Science in (Proceedings of the New Zealand Society of Soil Science Conference on), 608
New Zealand Environments : Differences in Proportion of Fawns to Hinds in Red Deer (*Cervus elaphus*) from several (Thane Riney), 488
New Zealand Forestry Research, 117
New Zealand Heavy-Water Scheme, 213
New Zealand Pottery and Ceramics Research Association Appointment of I. C. McDowall as director, 119
New Zealand Society of Soil Science : Proceedings of the Conference on Soil Science in New Zealand, 608
Newell, G. F., and others : Visibility of Noise in Television, 519
Newer Techniques in Organic Analysis, *review* by Dr. G. M. Bennett, 546
Newing, C. R., and MacLeod, A. K. : Magnetically Induced Vortex for Small-scale Aerated Culture Studies, 939
Newman, James R. (edited by) : What is Science ?, *review* by Dr. W. L. Sumner, 1097
Newman, Prof. M. S. : Elected a Member of the National Academy of Sciences, Washington, 926
Newton, B. A. : A Synthetic Growth Medium for the Trypanosomid Flagellate *Strigomonas* (*Herpetimonas*) *oncopelti*, 279
Newton, Dr. G G. F. (Abraham, Dr. E. P., and) : Antibiotics and Mould Metabolites, 1059
Nicholas, Dr. D. J. D., and others : Some Problems associated with Determining Iron in Plants, 336
Nicholl, A. M. C. : Fifty Years of Bird-watching, review by Frances Pitt, 722
Nicholls, J. R. : The Analysis of Drugs and Chemicals, review, 597
Nichols, Prof. J. E. Animal Husbandry, 607
Nicholson, E. M. : Wild-Life Refuges in the United States, *review*, 765
Nickel : Emission of Photo Radiations by the Impact of Positive Ions of Helium on (Prof. Rafi M. Chaudhri, Mustafa Yar Khan and Abdul Latif Taseer), 1226
Nicol, Prof T., and Bilbey, D. L. J. : Effect of Cortisone on the Blood, 524
Nicol, Prof. T., and Snell, R. S. : Effect of Cortisone on the Reticulo-Endothelial System, 430
Nicol, Prof. T. (Snell, R. S., and) : Effect of Cortisone on the Serum Gamma-Globulin, 578
Nicotiana : The Genus (Prof. Thomas Harper Goodspeed), *review*, 203
Nicotiana Leaves after Removal from Plant : Amino-Acid Metabolism of (Shri Ranjan and M M. Laloraya), 235
Nicotinic Acid : Bacterial Degradation of (Isaac Harary), 328
Nielsen, H. H., and Rao, K. N. : Spectroscopy, 738
Nielsen, N., and others : Enrichment of Heavy Water by a Biological Method, 988
Niemann, Carl, and others (edited by) : Organic Reactions, Vols. 7 and 8, *review* by Prof John Read, 249
Nininger, Robert D. : Minerals for Atomic Energy, *review* by S. H. U. Bowie, 403
Nitric Acid Solutions Solvent Extraction of Polonium from (J. Danon and A. A. L. Zamith), 746
Nitrogen : Adsorption Spectrum of, on Tungsten (Dr. Gert Ehrlich and Dr. T. W. Hickmott), 1045
Nitrogen Dioxide : Reaction between Formic Acid and (Dr. F. H. Pollard and K. A Holbrook), 799
Nitrogen Mustards : Selectivity of Enzyme-activated (P. Hebborn and Prof. J. F. Danielli), 25
Nitrosomonas in Soil and Culture : Estimation of Numbers of (J. W. Millbank), 848
Nitta, Keijiro, and others : Photoelectric Phenomena with Copper Phthalocyanine, 672
Niven, Jr., Wm. W. (edited by) : Industrial Detergency, *review* by R. E. Wagg, 249
Njoku, E : Morphogenesis in Leaves, 778
Noakes, G. R. : Colour Television, *review*, 497
    General Physics, *review*, 767
    Introductory Applied Physics, *review*, 767
    Education Group of the Institute of Physics—Annual Conference, 780
    Skyhooks and Satellites, *review*, 862
    Principles and Applications of Physics, *review*, 1051
Noble, Prof. R. L. : The Neurohypophysis, 1020
Nodule Formation in *Soja hispida* : Influence of Day-length on, by a Specific Rhizobium Strain (Ch. Bonnier and C. Sironval), 93
Nodules (Root), of *Casuarina* . A Feature of the (Dr. G. Bond), 191
Noise in Television : Visibility of (R. D. A. Maurice, M. Gilbert, G. F. Newell and J. G. Spencer), 519
Noise (Low-frequency Atmospheric), during the Cosmic-Radiation Storm of February 23 : Sudden Decrease in (C. A. McKerrow), 1223
Nomenclature : Zoological, 414
Nomenclature in Microscopy (Dr. John R Baker), 194
Nomenclature (Chemical) : The Prefix 'Nor' in (Dr. A. M. Woolman), 1046 , (Prof. J. H. Gaddum), 1046
Nomenclature (Zoological), International Commission on : Decisions on Zoological Names for certain Birds, 1111
Nomura, Masayasu, and Hosoda, Junko : Action of an Autolytic Enzyme of *Bacillus subtilis* on the Cell Wall, 1037
Non-Autonomous for the Red Eye Pigments : A Mutant of *Drosophila* without *Iso*xanthopterine which is (Prof. Ernest Hadorn and Ilse Schwinck), 940
Non-Crystalline Materials : Semi- and (X-Ray Analysis Group of the Institute of Physics Conference on), 121, *erratum*, 314
Non-Destructive Testing : Physics of some New Aspects of (Non-Destructive Group of the Institute of Physics Summer Meeting on), 1113
Non-Destructive Testing of Materials and Structures . Proceedings of the International Symposium on (International Union of Testing and Research Laboratories for Materials and Structures), 468
Non-Euclidean Geometry : Lobachevski and, 312
Non-metallic Fungicides (G. N. Mahapatra), 938
'Nor' : The Prefix, in Chemical Nomenclature (Dr. A. M. Woolman), 1046 ; (Prof. J. H Gaddum), 1046
Noradrenaline in Submicroscopic Structures of Adrenergic Axons : Evidence for the Presence of (Prof. U. S. von Euler and N.-Å. Hillarp), 44
Normal Levels : Reduction to, of the High Erythrocyte Sedimentation-Rates in Apparently Healthy South African Bantu Men (A R. P. Walker, D. C. Fletcher, P. A. Reynolds, I. Bersohn and E. D. Sonnenfeld), 480
Normal Resistance-levels of *Anopheles gambiae* to various Insecticides (Dr. J. R. Busvine), 533
Normal and Homologous Tumour Cells : Differences between the Electrical Charge carried by (Dr. E. J. Ambrose, A. M. James and J. H. B. Lowick), 576
Normal and Iron-deficient Plants of *Hibiscus esculentus* L. : Chromatographic Detection of Free Amino-acids in (S. D. Démétriadès), 95
Normand, Dr. C. E. . Production and Utilization of Electromagnetically Enriched Isotopes, 157
North, Dr. F. J : An Illustrated History of Science, *review*, 107
North African Prehistory, *review* by M. C. Burkitt, 1006
North America : A Manual of the Dragonflies of (Anisoptera), (Prof. James G. Needham and Prof. Minter J. Westfall, Jr.), *review* by D. E Kimmins, 450
    Mosquitoes of, (North of Mexico), (Stanley J. Carpenter and Walter J. La Casse), *review*, 56
North American Indians and in Japanese : The Blood Group Antigen *Diego* in (Marion Lewis, Hiroko Ayukawa, Dr. Bruce Chown and Dr. Philip Levine), 1084
North American Mosquitoes, *review*, 56
North-American Plant Taxonomy, *review* by Prof. T. G. Tutin, 546
North Atlantic Treaty Organization (Aeromedical Panel of the Advisory Group for Aeronautical Research and Development) : Anthropometry and Human Engineering, a Symposium on Anthropometry, Human Engineering and Related Subjects on May 3–4, 1954, in Scheveningen, The Netherlands, *review* by Wing-Comdr. F. Latham, 350
North-Eastern Africa (Eastern and) : Birds of (C. W. Mackworth-Praëd and C. H. B. Grant), *review* by Sir Landsborough Thomson, 203
North-West American Forests in relation to Sylviculture in Great Britain : Studies of (R. F. Wood), 1207
Northampton Polytechnic, London : Extension to be opened by Sir David Eccles, 736
    Opening of Extension, 969
Northern Advisory Council for Further Education : Eighth Annual Report, 1112
Northern Ireland : Distribution of Physiological Races of *Phytophthora infestans* (Mont.) de Bary in (D. A. Doling), 230
Northern Ireland, Universities of Great Britain and : Conference on the Age-Group Bulge and its Possible Effect on University Policy, 115
Northumberland National Park, 1156
Northwestern University Technological Institute : Proceedings of the Ninth Annual Conference on the Administration of Research, 676
Norval, J., and others : Leptospirosis in Piggery Workers, 1042
Norwood, Sir Cyril : *Obituary*, 688
Notation (Logarithmic) : Use of, in Science and Engineering (Prof. S. Devons), 373
Noyes, Prof. W. A. : Documentation of Applied Chemistry, 169
Nuclear Energy : Industrial Uses of, in Britain, 461
    The Place of, in United Kingdom Power Development (V. A Pask and J. C. Duckworth), 204
    Possibilities of Action in the Field of (Working Party on Nuclear Energy), (Organization for European Economic Co-operation), 380
Nuclear Energy Conference, British : Inaugural Meeting, 204
Nuclear Energy Conference, British (Institute of Physics in conjunction with the) : Conference on the Physics of Nuclear Reactors, 831
Nuclear Engineering, Vol. I, No. I, 829
Nuclear Engineering: Autumn Course in (Queen Mary College, London), 653
    Undergraduate Course in (University of Glasgow), 508
Nuclear Explosions : Genetical Effects of Radiations from Products of (Prof F. W. Spiers), 226 ; (Prof. J. B. S Haldane), 227
Nuclear Moments (Prof. Norman F. Ramsey), *review* by Dr. B. H. Flowers, 497
    Measurement and Application of, *review* by Dr. B. H. Flowers, 497
Nuclear Physics, Vol. I, No. I, 413
Nuclear Physics : Numerical Tables for (Charles Noel Martin), *review* by J. S. Story, 57
    Progress in (edited by Prof. O. R. Frisch), Vol. 4, *review* by Dr. E. Bretscher, 54

Nuclear Power, Vol. I, No. I, 919
Nuclear Power in Britain : Industry and, 362
Nuclear Power and its Development in Britain, 857
Nuclear Power Development : The Use of Research Reactors in (H J. Grout), 205
Nuclear Power Industry Health and Safety in a (A S McLean and W. G. Marley), 205
Nuclear Reactions International Conference on (Nederlandsche Natuurkundige Vereniging), 693
Nuclear Reactors . Physics of (Institute of Physics in conjunction with the British Nuclear Energy Conference, Conference on), 831
Nuclear Research : European Co-operation in (Unesco and its Programme, No 11), 397
Nuclear Research, European Organization for : Scheme of Guest Professorships, 117
  Election of Officers, 117
  Symposium on High-Energy Physics, 117, 1065
Nuclear Science Recent Advances in, *review* by Dr E. Bretscher, 54
Nuclear Vacuolation in the Liver Cells of Depancreatized Baboons (Prof. Joseph Gillman and Christine Gilbert), 656
Nuclear Weapons (Manual of Civil Defence, Vol I, Pamphlet No. I), (Home Office and Scottish Home Department), 262
  International Control of, 17
Nuclear and Cytoplasmic Volumes in the Hepatic Cells of the Fœtal Sheep (D. A. T. Dick), 236
Nuclear and Meson Physics : Proceedings of the 1954 Glasgow Conference on (edited by E. H. Bellamy and R. G Moorhouse), *review* by Dr. J. C. Bower, 154
Nuclear Quadrupole Interaction Frequencies : Correlation of, with Polarographic Half-Wave Potentials (Dr T. Iredale), 36
Nuclei Artificial Ice-forming (B. J. Mason and J. Hallett), 681
Nuclei of Neurones : Changes in the Dimensions of, with Activity (Dr. M R. A Chance, A. J. Lucas and Dr. J 'A. H. Waterhouse), 1081
Nuclei of Plants Grown at Different Temperatures Variations in the Amount of Feulgen Stain in (Dr. L. F. LaCour, Dr. E. M. Deeley and Dr. J. Chayen), 272
Nuclei (Condensation) : Proceedings of the First International Symposium on, at Dublin, April 1955 (edited by Mario Bossolasco), *review* by B. J. Mason, 1008
  Second International Symposium on, 877
Nucleic Acid Content and Distribution of Chromosome Number in Original and Sublines of Two Mouse Ascites Tumours (Dr. John S. Colter, Harris H. Bird, Hilary Koprowski and Hilda B Ritter), 993
Nucleic Acids and their Role in Protein Synthesis : The Structure of (Biochemical Society Symposium on), 602
Nucleic Acids of *Bacillus cereus* : Distribution of 8-Azaguanine in the (Dr. R. E. F. Matthews and Dr J D. Smith), 271
Nucleic Acids in Cyanophyceae : Chemical Nature of (B. B. Biswas), 95
Nucleus and Spindle of *Bacillus megatherium* in Fission and Sporulation (Dr. Akira Yuasa), 386 , (M. H. Jeynes), 849
Nuffield Foundation : Annual Report for 1954–55, 315
  Fellowships, Scholarships and Bursaries in Dentistry, Biology and the Social Sciences, 361
Nuffield Foundation (Royal Society and): Commonwealth Bursaries Scheme Awards, 165
Numbers : An Introduction to the Theory of (G. H. Hardy and E. M. Wright), third edition, *review*, 301
Numbers of Man and Animals (edited by J. B. Cragg and N. W. Pirie), *review*, 300
Numbers of *Nitrosomonas* in Soil and Culture : Estimation of (J. W. Millbank), 848
Numbers (Future), of University Students—the Desperate Need for Technologists (Lord Simon of Wythenshawe), 1214
Numerical Analysis (Prof. Zdenek Kopal), *review* by Dr. J. C. P. Miller, 953
Numerical Tables for Nuclear Physics (Charles Noel Martin), *review* by J S. Story, 57
Nunn, W. E. . Appointed veterinary officer, Uganda, 561
Nursten, Dr. H. E (Burton, Prof. D., and) Vegetable Tannins, 880
Nutation (Earth's Free) : Damping of the (Prof. B. Gutenberg), 887
Nutrition : Food Technology and, 1199
  Iodine and Fluorine in (Nutrition Panel of the Food Group of the Society of Chemical Industry Discussion on), 562, 912
Nutrition of Man and Animals . The Impact of Food Technology on the (Scottish Group of the Nutrition Society Discussion on), 1199
Nutrition (Crop) Chemistry and (Sir William Ogg), 208
Nutrition Society . Symposium on Diet and Anæmia, 878
  Symposium on Grassland and the Feeding of Livestock, 1113
Nutrition Society (Scottish Group) . Discussion on the Impact of Food Technology on the Nutrition of Man and Animals, 1199
Nutritional Aspects of *Mortierella hygrophila* Linn. (R H. Thornton) 662
Nutritional Requirements and Food Fortification (Nutritional Panel of the Food Group of the Society of Chemical Industry fourth and final meeting on), (Iodine and Fluorine in Nutrition), 562, 912
Nutritive Value of Flour : Report of the Panel on Composition and, 1150
Nutting, Dr. J. Mechanism of Phase Transformations in Metals, 419
Nyholm, Prof. R. S. : Awarded the H. G Smith Memorial Medal for 1955 of the Royal Australian Chemical Institute, 919
Nyholm, Prof. R. S., and others Some New Stereochemical Arrangements of Divalent Palladium and Platinum, 1127
Nylon 6 and 6 6 Polymers Cyclic Polyamides from—Constitution of the Cyclic Polyamides isolated from Nylon 6 Polymers (Dr. P. H. Hermans), 126 , Intramolecular Hydrogen Bonds in certain Cyclic Polyamides (Dr P. H Hermans), 127 ; Constitution of the Cyclic Polyamides isolated from Nylon 66 Polymer (C J. Brown, A. Hill and P V. Youle), 128 ; Synthesis of 1 : 8-Diaza*cyclo*-tetradecane (M. A. Thorold Rogers), 128

OAKLEY, Dr. K P. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 220 ; work of, 220
Oates, David . Awarded the Cuthbert Peek Grant for 1956 of the Royal Geographical Society, 606
Oats Virulent Attacks of Eyespot on (Prof R. McKay, J. B. Loughnane and T. Kavanagh), 193
Obese-Hyperglycæmic Mice : Effects of Pituitary Growth Hormone on the Insulin and Hyperglycæmic-glycogenolytic Factor extractable from the Pancreas of (Dr. D. W Clarke, Dr. G. A. Wrenshall and Dr. J Mayer), 1235
Observations in the Older Branches of Astronomy, especially Double Stars . The Need for (Dr. J Jackson), 975
Observatory (Commonwealth), Mount Stromlo, Canberra : The 74-in. Reflector of the, 357
Occurrence and Nature of an Amœba Excystment Factor produced by *Aerobacter* sp. (Dr. B N. Singh, Miss S. Mathew and M Sreenivasaya), 621
Ocean Turbulence in the Atmosphere and in the (H Charnock), 13
Ocean (Antarctic) : Phytoplankton and Hydrography of the Pacific Part of the (Grethe Rytter Hasle), 616
Ocean (Arctic) : Researches in the (Prof. G. E. MacGinitie), 1215
Ocean Floor (Hans Pettersson), *review* by Dr. J. D. H Wiseman, 450
Oceanographic Council, National : Annual Report for 1954–55, 1025
Oceanography . Grants for Research in Marine Biology or (Challenger Society), 1018
Ochoa, Prof. S., and Grunberg-Manago, Mme. M : Awarded the Charles Mayer Prize for 1955 of the Société de Chimie Biologique, 17
O Coinneáin, A. . Appointed chairman of the Irish National Committee for Geodesy and Geophysics, 877
Octanoic Acid . Oxidation of, by Cell-free Bacterial Extracts (S. Dagley), 1131
Odell, Prof. N. E. So-called 'Glacier-Worms' in New Zealand, 534
O'Donoghue, Prof C H *Obituary* of Dr. Sunder Lal Hora, 358
Oertel, Prof. H. : *Obituary* by Prof G. Payling Wright, 458
Oeser, O. A. (edited by) : Teacher, Pupil and Task, *review*, 250
Œstrous Cycle : Levels of Thyroid and Thyrotrophic Hormones in the Blood of Rats at various Stages of the (Dr. Fouad A. Soliman and Helmy M. Badawi), 235
Officers for the Oversea Civil Service . Central Pool of, 1017
Ogg, Sir William : Documentation of Applied Chemistry, 169
  Chemistry and Crop Nutrition (Ninth Dalton Memorial Lecture of the Royal Institute of Chemistry), 208
  The Place of Science and the Humanities in Education, 960
Ohio State University Symposium on Molecular Structure and Spectroscopy, 693
Oidium Infection : Zinc-deficiency of *Hevea brasiliensis* as a Predisposing Factor to (E. W. Bolle-Jones and R. N. Hilton), 619
Oil in the Karroo Series South Africa (Geological Survey of South Africa, Memoir 45), 830
Oil and Colour Chemists' Association : Eighth Technical Exhibition, 263
Oilfield Reservoir Engineering : Summer Course on (University of Birmingham), 1065
Okada, S. (Bruns, F , and) : Thermodynamic Aspects of the Action of Phosphohexoseisomerase, 87
O'Kane, B. J. . Electrical Equipment of Aircraft, 1211
Older Branches of Astronomy, especially Double Stars : The Need for Observations in the (Dr. J. Jackson), 975
Oldfield, Prof. R C. Appointed to the chair of psychology in the University of Oxford, 1109 ; work of, 1109
Olefin Complexes of Rhodium (Dr. J. Chatt and L M Venanzi), 852
Oligosaccharides . Ionophoresis of, as N-Benzylglycosylammonium Ions (Dr. S. A. Barker, Dr. E. J. Bourne, P. M. Grant and Prof M. Stacey), 1125
Oliver Memorial Fund : The 1955 Award given to Dr. W. d'A. Maycock, 119
Olley, Dr. June Phospholipids in Foods, 565
One Direction : Latin-Square Designs with Individual Gradients in (C P. Cox), 1092
O'Neill, Dr. L. A., and Cole, C. P : Epoxide Resins, 963
Onitiri, H. M. A. Awarded a Commonwealth Fund General Fellowship, 735
Opacity on Serum Agar Plates : Production of, by some Strains of *Staphylococcus aureus* (A. J H. Tomlinson and M. T. Parker), 895
Operational Calculus based on the Two-sided Laplace Integral (Dr. Balth van der Pol and Dr. H. Bremmer), second edition, *review* by Prof. L. M Milne-Thomson, 954
Ophiostoma multiannulatum : Synthesis of β-Galactosidase in, and some Properties of the Enzyme (Dr. B. v. Hofsten), 844
Opik, Dr. E. J. Density of the Lunar Atmosphere, 123
Oppenheim, Dr. A Elected a Fellow of the Royal Society of Edinburgh, 507
Optical Changes during Contraction . A New Muscle Preparation for the Study of (Dr. B. C Abbott and Dr. J. Lowy), 788
Optical Emission Nebula *NGC* 6357 : Absorption of 3·5-m. Radiation in the (B. Y. Mills, A. G. Little and K. V. Sheridan), 178
Optical Instrumentation (edited by Prof. George S. Monk and W. H. McCorkle), *review* by G. W. Hamstead, 450
Optical Investigation of Diamond Surfaces, *review* by Dr J. W. Mitchell, 1193
Optical Methods : Testing of Metals by, 564
Optical Properties of Thin Solid Films (Dr. O. S. Heavens), *review*, 550
Optics, International Commission for : Symposium on Frontiers in Physical Optics, 263
Optics (Physical) : Frontiers in (International Commission for Optics Symposium on), 263
Optimal Span of Working Life, *review* by Prof. John Cohen, 449
Orcinol—Sulphuric Acid Reaction . Use of the, in the Positive Identification of certain Monosaccharides from a Salivary Mucoid (Dr. M Irwin and Dr. A. G. Leaver), 1126
Order : Beauty and, 1157
Organic Acids and Sugars in Freeze-dried Apricots : Reactions between Amino-Acids, (E. F. L. J. Anet and T. M Reynolds), 1082
Organic Analysis (edited by John Mitchell, Jr., I. M. Kolthoff, E. S. Proskauer and A. Weissberger), Vol. 2, *review* by Dr. G. M. Bennett, 546
  Newer Techniques in, *review* by Dr. G. M. Bennett, 546
Organic Binding of Iodine in the Endostyle of *Ciona intestinalis* (Prof. E. J. W. Barrington and L. L. Franchi), 432
Organic Chemist : Physics for the, *review* by Dr. W. A. Waters, 721

Organic Chemistry (Dr. I. L. Finar), second edition, *review* by G. F., 1101
Organic Chemistry (Prof. Lewis F. Hatch), *review* by G. Fowles, 1194
Organic Chemistry : Ciba Research Scholarship in the Techniques of (University of Birmingham), 693
  The Development of, since Perkin's Discovery (Sir Alexander Todd), 1099
  Technique of (edited by Arnold Weissberger), Vol. 7, Organic Solvents, completely revised second edition by John A. Riddick and Emory E. Toops, Jr., *review*, 639
Organic Compounds : Handbook of, *review*, 639
Organic Peroxides (Arthur V. Tobolsky and Robert B. Mesrobian), *review* by Dr. G. M. Bennett, 814
Organic Peroxides and Mutagenic Effects in *Drosophila* (Dr. F. H. Sobels), 979
Organic Preparations : Semi-Micro (Dr. J. H. Wilkinson), *review* by G. Fowles, 957
Organic Process Invagination as an (Prof. R. Ruggles Gates), 1184
Organic Radicals in Plant Materials : Microwave Detection of Metallic Ions and (Howard Shields, William B. Ard and Prof. Walter Gordy), 984
Organic Reactions (edited by Roger Adams, A. H. Blatt, Arthur C Cope, David Y. Curtin, Frank C. McGrew and Carl Niemann), Vols. 7 and 8, *review* by Prof. John Read, 249
Organic Solvents (on the basis of the first edition by Arnold Weissberger and Eric S. Proskauer), completely revised second edition by John A. Riddick and Emory E. Toops, Jr , *review*, 639
  Ultra-Violet Absorption of Oxygen in (Allan U. Munck and Dr. Jesse F. Scott), 587
Organic Structures : Determination of, by Physical Methods (edited by E. A. Braude and F. C. Nachod), *review* by Dr. W. A. Waters, 721
Organic Syntheses (edited by William S. Johnson), Vol. 34, 1954, *review* by Prof. John Read, 301
Organism (Coliform) (*Escherichia*) · Effect of a, on the Second Ecdysis of Nematode Larvæ parasitic in the Horse (D. Poynter), 481
Organization of Defence Research in Britain (Chapman Pincher), 251
Organization for European Economic Co-operation : Possibilities of Action in the Field of Nuclear Energy (Working Party on Nuclear Energy), 398
Organization for European Economic Co-operation (European Productivity Agency of the) : Report on Technical Information Services in Europe, 695
Orhan, A. M. : Appointed veterinary officer, class I, Cyprus, 1207
Oriel, John A. : Automatic Control in the Process Industries, 253
  The Technological Awakening, 873
Orientation (Crystallite), in the Tooth Dentine of *Macropus* (Dr. D. F. G. Poole), 485
Origin of the Earth · Kelvin on the (D. W. Allan), 801 ; (T. Gold), 802
Origin of Vertebrates (Prof. N. J. Berrill), *review* by Prof. J. Z. Young, 764
Origin and Development of the Civil Service : A History of Red Tape, an Account of the (Sir John Craig), *review* by R. B., 154
Original : Image and, *review* by Prof. L. M. Milne-Thomson, 954
Original and Sublines of Two Mouse Ascites Tumours : Nucleic Acid Content and Distribution of Chromosome Number in (Dr. John S. Colter, Harris H. Bird, Hilary Koprowski and Hilda B. Ritter), 993
Origins of Cultivated Bananas : Taxonomy and (N. W. Simmonds and K. Shepherd), 1111
Origins of Education, *review* by A. C. F. Beales, 296
Origins of Intellect, *review* by Prof. O L. Zangwill, 907
Orobanchaceae : Further Chromosome Counts in (David J. Hambler), 438
Orotic Acid as a Survival Factor in Rats Deficient in the Animal Protein Factors of Casein (A. Rabbi, M. Marchetti, R. Viviani and Prof. G. Moruzzi), 757
O'Rourke, Prof. Fergus J. : Observations on Pool and Capillary Feeding in *Aedes aegypti* (L.), 1087
Orr, Joseph L. : Appointed liaison officer of the Food and Agriculture Organization at the United Nations Headquarters, 70
Orthoptera (South American) : Cytogenetics of (Dr. Francisco A. Saez), 490
Orthoptères ; Colloque sur l'Acoustique des, Jouy-en-Josas, 5–8 Avril 1954 (Annales de l'Institut National de la Recherche Agronomique, Série C, Annales des Épiphyties), (René-Guy Busnel), *review* by Dr. P. T. Haskell, 403
Osberghaus, Dr. O. : Production and Utilization of Electromagnetically Enriched Isotopes, 160
Osborne, Dr. Robert · Awarded the Neill Prize for 1953–55 of the Royal Society of Edinburgh, 507
Osborne, R. E. : Appointed chief agricultural officer, Jamaica, 1207
Oster, L. . Electron Microscopy of Fibres, 318
Otariids · Scent of (J. E. Hamilton), 900
Othmer, Donald F. (edited by Kirk, Raymond E , and) : Encyclopedia of Chemical Technology, Vol. 11, Polyols to Rutin ; Vol. 12, Sabadine to Stilbestrol , Vol 13, Stilbite to Thermochemistry , Vol 14, Thermodynamics to Waterproofing, *review* by Sir Alfred Egerton, 861
Ott, Emil, and others (edited by) · Cellulose and Cellulose Derivatives, second edition, *review* by Prof. E L. Hirst, 677
Ottensooser, F., and others : The *Diego* Blood Factor in Brazilian Indians, 41
Our Time · Academic Freedom in (Prof. Robert M. MacIver), *review* by R. Brightman, 1190
Ourisson, G. · Chemistry of Oxygenated Heterocyclic Compounds, 1116
Outbreeding in Field Beans (*Vicia faba*) : Regulation of (Jean M Drayner), 489
Outlook · Further (F. H. Ludlam and R. S. Scorer), *review* by James Paton, 641
Outlook for Man, *review* by R. Brightman, 3
Ova (Tubal Mouse) : Culture of (W. K. Whitten), 96
Ovary-inhibiting Hormone of Crustaceans · The 'Queen-Substance' of Honeybees and the (Dr. David B. Carlisle and Dr. Colin G. Butler), 276
Ovenall, D. W., and others : Aggregation of Spherical Particles, 1091
Oversea Civil Service : Central Pool of Officers for the, 1017
Overseas Food Corporation : Annual Report for 1954–55, 1165
Ovotestis of *Cepea nemoralis* L. : Influence of Temperature on the Histological Evolution of the (J. Bouillon), 142
Ovulation during Delayed Implantation and other Reproductive Phenomena in the Badger (*Meles meles* L.), (Prof. R. J. Harrison and E. G. Neal), 977
Owen, L. E., and Manning, D. C. : Spectroscopy, 737
Owen, Dr. L. N. : *Obituary* of Dr. M. A. Whiteley, 1202
Owen, M. E., and Mortimer, R. K. : Dominant Lethality induced by X-Rays in Haploid and Diploid *Saccharomyces cerevisiae*, 625
Owen, P. C., and Watson, Dr. D. J. : Effect on Crop Growth of Rain after Prolonged Drought, 847
Owen, P. R. : Appointed professor of the mechanics of fluid motion in the University of Manchester, 562
Owen, R. D. : Immunological Tolerance, 869
Owens, Harry L. (Coblenz, Abraham, and) : Transistors, *review* by J. R. T., 301
Own · My Time is My—an Irishman at the B.B.C. (John Irwin), 102
Oxalis : Chromosome Numbers in (G. E. Marks), 735
Oxalis ('Genus') · Two Modes of Inheritance of the Short-styled Form in the (Mrs. V. C. Fyfe), 942
Oxidation of D-Amino-Acid in the Diencephalon Part of the Brain : Inhibitory Action of Chlorpromazine on the (Dr. Kunio Yagi, Toshiharu Nagatsu and Takayuki Ozawa), 891
Oxidation of *p*-Hydroxyphenylpyruvic Acid to Homogentisic Acid : A Requirement for Catalase in Tyrosine Metabolism—the (Dr. Bert N. La Du and Vincent G. Zannoni), 574
Oxidation of Octanoic Acid by Cell-free Bacterial Extracts (S. Dagley), 1131
Oxidation as a Source of 'Anomalies' in Amylose (H. Baum, Dr. G. A. Gilbert and N. D. Scott), 889
Oxidation (Aerobic), of Unsaturated Fatty Acids : Metal Ion Catalysis and Polarity of Environment in the (Dr. N. Uri), 1177
Oxidation (Coupled), of Keto-Acids with Glutathione (D. Cavallini, G. F. Azzone and F. Stirpe), 1232
Oxidation (Hydrocarbon) : Potassium Ion Stimulation of, by a Soil *Corynebacterium* sp. (J. N. Ladd), 939
Oxidation (Photochemical), of Alcohols by Dichromate (Dr. E. J. Bowen), 889
Oxidation Intermediates of Cysteine : Separation of Unstable (Dr. G. Toennies and J. J. Kolb), 281
Oxidation-Reduction Potential of Modified Cytochrome c (R. W. Henderson and W. A. Rawlinson), 1180
Oxidative Phosphorylation of Liver and Brain Mitochondria : Action of Chlorpromazine on (Magdalena Berger, H. J. Strecker and Prof. H. Waelsch), 1234
Oxide Films on Metals : Use of Capacity Measurements for the Study of (J. N. Wanklyn), 849
Oxygen in Organic Solvents : Ultra-Violet Absorption of (Allan U. Munck and Dr. Jesse F. Scott), 587
Oxygen (Dissolved) : Galvanic Measurement of (A. G. Dowson and I. J. Buckland), 712
Oxygen Concentration (Inspired) : Simultaneous Recording of, and Peripheral Tissue Oxygenation (Dr. R. H. Kay and Dr. R. V. Coxon), 45
Oxygen Consumption and Active Transport of Sodium in the Isolated, Short-circuited Frog Skin (Dr. K. Zerahn), 937
Oxygenated Heterocyclic Compounds : Chemistry of—International Colloquium at Lyons, 1116
Oxygenation (Peripheral Tissue) : Simultaneous Recording of Inspired Oxygen Concentration and (Dr. R. H. Kay and Dr. R. V. Coxon), 45
Oxytocin as Stimulator for the Release of Prolactin from the Anterior Pituitary (G. K. Benson and Dr. S. J. Folley), 700
Ozawa, Takayuki, and others : Inhibitory Action of Chlorpromazine on the Oxidation of D-Amino-Acid in the Diencephalon Part of the Brain, 891
Ozone Layer : Turbulence above the (Alan E. Slater), 1207

PACIFIC Area : Marine Science in the (Dr. G. E. R. Deacon), 353
Pacific Part of the Antarctic Ocean : Phytoplankton and Hydrography of the (Grethe Rytter Hasle), 616
Packaging and Storage : Corrosion Prevention in (Corrosion Group and the Birmingham and Midland Section of the Society of Chemical Industry Symposium on), 511
Packham, Angus (Jarrett, I. G. and): Response of the Sheep to Sublethal Doses of Fluoroacetate, 580
Packter, Dr. A. · Yield Stress of Clay-Water Systems, 144
Padget, Dr. P. . Appointed Oppenheimer Geological Fellow in the Institute of African Geology of the University of Leeds, 609
Page, D. H. : Fibre Microscopy, 515
Page, Irvine H., and others (edited by) : Neurochemistry, *review* by Prof. J. N. Davidson, 811
Page, R S. (Millen, T. S., and) : Fibre Microscopy, 516
Paget (Stephen) Memorial Lecture of the Research Defence Society (Sir Henry Dale), 362
Paice, E S. : Epoxide Resins, 963
Pain, J. F · Fellowship of the City and Guilds of London Institute conferred on, 363
Paine, Clifford : Development of the Dyestuffs Industry, 1009
Paintings and Engravings (Rock), in Hyderabad (Colonel D. H. Gordon and Dr. F. R. Allchin), 1063
Paiva, Djalma, and others : Carioazulene, Natural and Synthetic, derived from Caryophillene, 145
Pakistan : Geophysical Research in (Meteorological Service of Pakistan, Geophysical Review, Part 4, Technical Progress No. 7), 1158

Palladium and Platinum (Divalent) : Some New Stereochemical Arrangements of (Dr. C. M. Harris, Prof. R. S. Nyholm and N. C. Stephenson), 1127
Palmer, H G. : Production and Utilization of Electromagnetically Enriched Isotopes, 160
Palmer, Dr. W. G. : Experimental Inorganic Chemistry, *review*, 499

Pancreas of Obese-Hyperglycæmic Mice : Effects of Pituitary Growth Hormone on the Insulin and Hyperglycæmic-glycogenolytic Factor extractable from the (Dr. D. W. Clarke, Dr. G. A. Wrenshall and Dr. J. Mayer), 1235
Pancreas (Mouse) · Zymogen Formation in the (N. Xeros), 843
Paneth, Prof F. A. · Extension of Microchemistry, *review*, 953
Pankhurst, Dr. Kenneth : The Presentation of Science to the Public, 1066
Pannekoek, A., and others (edited by) The Principal Works of Simon Stevin, Vol. I, General Introduction, Mechanics, *review* by Prof. E. N da C. Andrade, 3
Panov, Dr. U. V. : Documentation of Applied Chemistry, 168
Pantin, Dr C. F. A. : Sources of Animal Behaviour, 372
Papers on Metallurgy · Capper Pass Awards for (Institution of Mining and Metallurgy and the Institute of Metals), 68, 363
Papers in Review Articles Quotation of Titles of (Dr. Charity Waymouth), 98 ; (N. W. Pirie), 440 , (Dr. Kenneth M. Smith), 464
Papers (Scientific), and Scientific Language, 1
Parabiotic Rats . Fæcal Micro-organisms of (Dr. Helen R. White), 751
Paradox : The Langmuir, in Discharge Plasmas (Dr. H. Martin and Prof. K. G. Emeléus), 943
Paramagnetic Resonance · Analysis of Crystalline Hæmoglobin Derivatives by (J. E. Bennett and Dr. D. J. E. Ingram), 275
Paramagnetism as a Reduction Product of Vitamin B_{12} (Dr. F. Grun and R. Haas), 378
Paramecium : Arresting (Dr. C. Ellenby), 98
Parasites of Man : Introduction to Parasitology, with Special Reference to the (Prof. Asa C. Chandler), ninth edition, *review* by Dr. G. Lapage, 55
Parasites (Seed-borne), in Seeds : Detection of (Prof. A. E. Muskett and Dr. J P. Malone), 465
Parasitism (Fungal) : Physiology of, 738
Parasitology : Introduction to, with Special Reference to the Parasites of Man (Prof. Asa C. Chandler), ninth edition, *review* by Dr. G. Lapage, 55
  Outline of, *review* by Dr. G. Lapage, 55
Parbrook, Dr. H. D : Technology of Sound, *review*, 4
Parbrook, Dr. H. D (Tempest, W., and) : Absorption of Ultrasound in Light Gases, 181
Paris Academy of Sciences : Election of Prof. Léon Binet as vice-president for 1956, 119
  Election of Prof. J Piveteau as a member of the Geology Section, 364
  Election of Prof. C. Bressou as a member of the Rural Economy Section, 511
  Election of Prof. F. van den Dungen as *correspondant* for the Mechanics Section, 511
  Election of Prof P. Tardi as a member of the Geography and Navigation Sections, 918
  Election of Prof. A. Vandel as a non-resident member, 918
  Election of Prof H Lundegardh as a *correspondant* for the Rural Economy Section, 918
  Election of Prof. E. Schmidt as a *correspondant* for the Geometry Section, 918
  Election of Prof. C. Killian and Prof. F. W. Went as *correspondants* for the Botany Section, 918
  Election of Prof M. Fréchet as a member of the Geometry Section, 1062
  Election of Prof. H Milloux, Prof. C L. Siegel and Prof. Marston Morse as *correspondants* for the Geometry Section, 1062

Pest Control (Geigy) Fifteen Years of (Geigy Co., Ltd), 652
Pesticides (Commercial) : Modern Development of, 652
Petal (Green) Disease in Strawberry : Leaf-hopper Transmission of a Clover Virus causing (N. W. Frazier and A. F. Posnette), 1040
Peters, A. J. · Detection and Development of Scientific Ability, 824
Peters, Sir Rudolph : Hormones and the Cytoskeleton, 426
Peters, Prof. R. H., and Atherton, R. : Recent Advances in the Chemistry of Colouring Matters, 646
Pethica, Dr. B. A. . Phospholipids in Foods, 565
Petrels : Moult Adaptation in relation to Long-distance Migration in (Dr. A. J. Marshall and D. L. Serventy), 943
Petroleum · Hydrocarbons from (Prof. Frederick D. Rossini, Beveridge J. Mair and Anton J. Streiff), *review*, 401
Petroleum, Institute of : Election of Officers for 1956–57, 876
Petroleum, Institute of (Hydrocarbon Research Group) · Symposium on Vapour Phase Chromatography, 968
Petroleum Ether (80°–100° C.) used as a Dispersing Agent for the Examination of Particulate Matter by Electron Microscopy and Electron Diffraction (E. H. Boult), 484
Petroleum Geology : Some Fundamentals of (Dr. G. D. Hobson), *review* by H. B. Milner, 6
Pettersson, Prof Hans : The Ocean Floor (Silliman Memorial Lectures), *review* by Dr J. D. H. Wiseman, 450
  Elected a Foreign Member of the Royal Society, 827, 918 , work of, 918
Pettersson, Hjalmar, and others : Propagation of an Air-transmitted Shock Wave in Muscular Tissue, 380
Pettersson, Max : Diffusion of a New Habit among Greenfinches, 709
Pettingell, W. W. : Appointed a member of the Advisory Council of the Commonwealth Scientific and Industrial Research Organization, 734
Pfeister, Kathryn, and others : Immunological Studies with Protein Fractions isolated from Ehrlich Ascites Carcinoma Cells, 994
Pflanzlicher Nahrungs- und Genussmittel . Mikroskopische Untersuchung (Dr. Gustav Gassner), dritte Auflage, *review* by C. R. Metcalfe, 863
Pharmacological Action of Rauwolscine (J D. Kohli and N N. De), 1182
Pharmacology of Thioctic Acid : Chemistry, Biochemistry and (Symposium at the University of Naples), 75
Pharmacopœia The Extra (Martindale), Vol. 2, twenty-third edition, *review* by Prof. J. H. Gaddum, 350
Phase Rule · Crystallography and the (Prof. A. R Ubbelohde), 123
Phase Transformations in Metals Mechanism of (Metal Physics Committee of the Institute of Metals Symposium on), 419
Phase Transition in Collagen—Diluent Mixtures . Evidence for a Reversible First-Order (R. R. Garrett and Prof. P. J. Flory), 176
Phelps, S R. : Awarded an Ablett Prize for 1955 of the Iron and Steel Institute, 919
2-Phenacylpyridine Derivatives . Infra-Red Spectra of Chelating Agents—(R F Branch), 671
Phenolase Complex Structures and Functions of the (Dr. H. S. Mason), 79
Phenomenological Considerations of the Interruption Theory of Line Broadening (Dr. Robert G. Breene, jun.), 922
Phenyl *Iso*thiocyanate Degradation of Peptides Mechanism of the (Pehr Edman), 667
Phenylalanine : Conversion of, into Tyrosine in the Silkworm Larva (*Bombyx mori*), (T. Fukuda), 429
L-Phenylalanine : Utilization of the Carboxyl Carbon of, for the Synthesis of the Amino-acids of Silk by *Bombyx mori* (S. Bricteux-Grégoire, W. G. Verly and Prof. M. Florkin), 1237
Philbin, Mrs. E. M. : Vegetable Tannins, 880
  Chemistry of Oxygenated Heterocyclic Compounds, 1116
Philipp, W., and others : Electrical Equipment of Aircraft, 1211
Phillimore, Colonel R. H. (collected and compiled by) : Historical Records of the Survey of India, Vol. 3, 1815 to 1830, *review* by Brigadier G. F. Heaney, 444
Phillips, A. E. H. : Appointed technical publications officer (agriculture), Federation of Nigeria, 1112
Phillips, Prof John : Agriculture in the University College of the Gold Coast, 610
Phillips, Dr. Norman A. : Awarded the Napier Shaw Memorial Prize of the Royal Meteorological Society, 1203
Phillips, T. A : Appointed deputy director of agriculture, Eastern Region, Nigeria, 561
Philosophy : Physics and (Lord Cherwell), 214
Philosophy (Experimental), at Oxford, 1155
Philpot, A. J. : Retirement from the directorship of the British Scientific Instrument Research Association, 827 ; work of, 827
Phonation : Action Potentials from Internal Laryngeal Muscles during (K. Faaborg-Andersen and Dr. Fritz Buchthal), 340
Phosphatase (Alkaline) · Histochemical Techniques for Electron Microscopy—(Dr. D. Brandes, H. Zetterqvist, and H. Sheldon), 382
Phosphatase (Alkaline), in the Cell Wall of *Chlorella vulgaris* · An Electron Microscopical Study of the Histochemical Localization of (Dr. D. Brandes and Dr. R. N. Elston), 274
Phosphatase (Alkaline), in Madreporaria : Histochemistry of Mucopolysaccharide-like Substances and (Thomas Goreau), 1029
Phosphohexoseisomerase : Thermodynamic Aspects of the Action of (F. Bruns and S Okada), 87
Phospholipid Metabolism of Skin (W. K. Berry), 789
Phospholipids (Biochemistry Division of the Chemical Institute of Canada Symposium on), 21
Phospholipids in Foods : (Food Group and the Oils and Fats Group of the Society of Chemical Industry Conference on), 119, 565
Phospholipids (Egg) . Composition of (Dr. D. N. Rhodes and Dr. C. H. Lea), 1129
Phosphorus in Iodine : Radioactivation Analysis of (J. A. James and D. H. Richards), 1230
Phosphorus Content of Rachitic Rat Cartilage : Effect of Vitamin D on the (J. G. Joshi and P. K. Dikshit), 625
Phosphorus (Radioactive) : Uptake of, by Larvæ and Adults of Mosquitoes (L J. Bruce-Chwatt and Dr. J. Hayward), 661
Phosphorylation as a Possible Factor in the Pasteur Effect in Plants (Dr. K. S. Rowan, Dr. D. E. Seaman and Prof. J. S Turner), 333
Phosphorylation (Oxidative), of Liver and Brain Mitochondria : Action of Chlorpromazine on (Magdalena Berger, H. J. Strecker and Prof. H. Waelsch), 1234
Photochemical Oxidation of Alcohols by Dichromate (Dr. E. J. Bowen), 889
Photoelectric Phenomena with Copper Phthalocyanine (Hiroaki Baba, Kazuo Chitoku and Keijiro Nitta), 672
Photoelectric Photometry : Astronomical (edited by Frank Bradshaw Wood), *review* by Dr. A. H. Jarrett, 814
Photogrammetry (Aerial) · Theory and Practice of (French National School for Geographical Sciences, Course on), 831
Photographic Method : Radioactivity of Iron Meteorites by the (S. Deutsch, Dr. E. Picciotto and Prof. F. G. Houtermans), 885
Photographic Method for the Study of Insect Migration (H. J. Sayer), 226
Photographic Science, 360
Photographic Society, Royal : Silver Progress Medal awarded to Dr. J. D. Kendall, 361
Photographic Society, Royal (Scientific and Technical Group) : Conference on the Science and Technique of Photography, 736
Photographische Methoden in der Radiochemie (Dr. H. Lauda), *review* by Prof. F. A. Paneth, 953
Photography : Science and Technique of (Scientific and Technical Group of the Royal Photographic Society Conference on), 736
Photography (High-speed) : Third International Congress on (Department of Scientific and Industrial Research), 876
Photo-Inhibition : Kinetics of Photosynthesis and (Dr. B. Kok and J. A. Businger), 135
Photolysis of Lead Tetramethyl : Absorption Spectra arising from the (Dr. C. L. Cook and J. G. Clouston), 1178
Photolysis (Flash), of Rhodopsin in the Retina (Dr. W. A. Hagins), 989
Photometry : Astronomical Photoelectric (edited by Frank Bradshaw Wood), *review* by Dr. A. H. Jarrett, 814
Photons in Two Coherent Beams of Light : Correlation between (R. Hanbury Brown and R. Q. Twiss), 27
Photoperiodism : Leaf Movements and the *Tagesrhythmik* Explanation of (Dr. M. Holdsworth), 845
Photo Radiations . Emission of, by the Impact of Positive Ions of Helium on Nickel (Prof. Rafi M. Chaudhri, Mustafa Yar Khan and Abdul Latif Taseer), 1226
Photostimulation of an Equatorial Bird (*Quelea quelea*, Linnaeus), (Dr. A. J . Marshall and H. J. de S. Disney), 143
Photosynthesis and a Homogeneous Protein Component of Plant Cytoplasm : Relationship between (Dr. J. W. Lyttleton), 283
Photosynthesis and Photo-Inhibition : Kinetics of (Dr. B. Kok and J. A. Businger), 135
Phototransistor, type *OCP71* : New Germanium (Mullard, Ltd), 830
Phoxinus laevis : Occurrence of Triple and Quadruple Cones in the Retina of the Minnow (Miss A. H. Lyall), 1086
Phthalocyanine (Copper) : Photoelectric Phenomena with (Hiroaki Baba, Kazuo Chitoku and Keijiro Nitta), 672
'Phyllosphere' : Occurrence of *Beijerinckia* Species in the (Dr. J. Ruinen), 220
Phylum Brachiopoda : A History of the Classification of the (Dr. Helen Marguerite Muir-Wood), *review*, 642
Physical Chemistry · Practical (Prof. Alexander Findlay), revised and edited by Dr. J. A. Kitchener, eighth edition, *review*, 203
Physical Chemistry in Queen Mary College, London, 68

Physical Constants for Alkali Halides : Empirical Relationship between the Excitation Energy of the *F*-band and (M. Levy), 241
Physical Metallurgy at the Imperial College, London, 559
Physical Methods : Determination of Organic Structures by (edited by E. A. Braude and F C. Nachod), *review* by Dr. W. A. Waters, 721
Physical Optics : Frontiers in (International Commission for Optics Symposium on), 263
Physical Procedures : Fractionation of Deoxyribonucleic Acid by (Dr K. V. Shooter and Prof J. A. V. Butler), 1033
Physical Review : Will no longer reprint the programmes and abstracts of papers contained in the *Bulletin* of the American Physical Society, 511
Physical Society : Discontinuance of the Reprint Scheme, 511
  Annual Exhibition of Scientific Instruments and Apparatus, 653
  Handbook of Scientific Instruments and Apparatus, 1956 Exhibition, 874
  Year Book for 1955, 1064
  Summer Meeting (The Physics of Gas Flow at Very High Speeds), 1064
Physical Society (Low Temperature Group), (X-Ray Analysis Group of the Institute of Physics and the) : Conference on Low-Temperature Crystallography, 511, 1067
Physical Society and the Royal Meteorological Society : Conference on Cloud Physics, 320
Physics : Cloud (Physical Society and the Royal Meteorological Society Conference on), 320
  Education through (Prof F. A. Vick), 1158
  Enrico Fermi and his Contributions to, 781
  General (Prof. Oswald Blackwood and Prof William Kelly), second edition, *review* by G. R. Noakes, 767
  High-Energy (European Organization for Nuclear Research International Symposium on), 117, 1065
  Introductory Applied (Norman C. Harris and Edwin M. Hemmerling), *review* by G. R Noakes, 767
  Principles and Applications of (Dr. Otto Bluh, in collaboration with Joseph Denison Elder), review by G. R. Noakes, 1051
  Radio-Frequency—Conference in Geneva (Dr. J. G Powles), 1022
  Theoretical—Symposium at St Andrews (Prof. J. F. Allen), 268
  University (Francis Weston Sears and Mark W. Zemansky), second edition, *review*, 957
Physics at Bedford College, London, 311
Physics at Exeter, 1062
Physics at Newcastle-upon-Tyne, 411
Physics for the Organic Chemist, *review* by Dr. W A. Waters, 721
Physics, Institute of : Annual Conference of the Education Group (G R. Noakes), 780
Physics, Institute of (Electron Microscopy Group) : Conference on the Electron Microscopy of Fibres, 318
  Annual Conference, 736
Physics, Institute of (Electronics Group) : Symposium on Some Recent Developments in Magnetism, 517
Physics, Institute of (Non-Destructive Testing Group) : Symposium on the Possible Uses of Surface Methods as a Means of Testing Metals (with Special Reference to Optical Methods), 564
  Summer Meeting on Physics of some New Aspects of Non-Destructive Testing, 1113
Physics, Institute of (Stress Analysis Group) : Summarized Proceedings of the Ninth Annual Conference, 561
Physics, Institute of (X-Ray Analysis Group) : Conference on Semi- and Non-Crystalline Materials, 121, *erratum*, 314
  Discussion on the Collection and Classification of Crystallographic Data, 1069
Physics, Institute of (X-Ray Analysis Group), and the Low Temperature Group of the Physical Society : Conference on Low-Temperature Crystallography, 511, 1067
Physics, Institute of, in conjunction with the British Nuclear Energy Conference : Conference on the Physics of Nuclear Reactors, 831
Physics, Institute of, and others Symposium on the Presentation of Science to the Public, 415, 1066
Physics Congress : Eleventh Annual (Canadian Association of Physicists), 1018
Physics of Atmospheric Clouds (F. H. Ludlam), 320
Physics of Gas Flow at Very High Speeds (Physical Society Summer Meeting on), 1064
Physics of Matter : Thermodynamics and (edited by Frederick D. Rossini), *review* by Prof L. Rosenhead, 400
Physics of some New Aspects of Non-Destructive Testing (Non-Destructive Testing Group of the Institute of Physics Summer Meeting on), 1113
Physics of Nuclear Reactors (Institute of Physics in conjunction with the British Nuclear Energy Conference, Conference on), 831
Physics of Stellar Atmospheres, *review* by Dr. Arthur Beer, 1191
Physics of the Seventeenth and Eighteenth Centuries : Evolution of a Scientific View of the Universe in the (B G. Kuznetsov), (in Russian), *review* by Dr. R. Eisenschitz, 1194
Physics, Nuclear, Vol 1, No. 1, 413
Physics (Nuclear) Numerical Tables for (Charles Noel Martin), *review* by J. S Story, 57
  Progress in (edited by Prof. O. R. Frisch), Vol. 4, *review* by Dr. E. Bretscher, 54
Physics (Nuclear and Meson) . Proceedings of the 1954 Glasgow Conference on (edited by E H. Bellamy and R. G. Moorhouse), *review* by Dr. J. C. Bower, 154
Physics (Pure and Applied), International Union of : Proceedings of the 1954 Glasgow Conference on Nuclear and Meson Physics (edited by E. H Bellamy and R. G. Moorhouse), *review* by Dr. J. C. Bower, 154
  Symposium on X-Ray Microscopy and Microradiography, 1065
Physics (Pure and Applied), International Union of (Joint Commission on Spectroscopy) : Meeting at Ohio State University, 693
Physics (Theoretical) : An Intelligent Man's Guide to, *review* by Prof. R. W. Ditchburn, 151
  Proceedings of the International Conference on, Kyoto and Tokyo, September 1953 (organized by the Science Council of Japan, with the collaboration of Kyoto University and the Physical Society of Japan), *review*, 1053
Physics (Theoretical), in the Australian National University, 116
Physics and Philosophy (Lord Cherwell), 214
Physik der Sternatmosphären, mit besonderer Berucksichtigung der Sonne (Prof. A. Unsold), zweite Auflage, *review* by Dr. Arthur Beer, 1191
Physiological Congress : Twentieth International, 779
Physiological Control of Population Growth (Sir Solly Zuckerman), 58
Physiological Races of *Phytophthora infestans* (Mont) de Bary in Northern Ireland : Distribution of (D A. Doling), 230
Physiological Reviews : Certain volumes to be reproduced by the Johnson Reprint Corporation, New York, by permission of the American Physiological Society, 877
Physiologically Inactive Beta-Prothromboplastin : Anticoagulant Specificity and (Dr. P. Fantl and Dr R. J Sawers), 1233
Physiologie der Zelle (Dr Johannes Haas), *review* by Dr. Laurence Picken, 1146
Physiology of Diapause in Arthropods (Dr. A D Lees), *review*, 907
Physiology of Fungal Parasitism, 738
Physiology of the Locomotory Muscles in the Cockroach (G Becht and Dr. D. Dresden), 336
Physiology of Phospholipids Chemistry and—Symposium in Ontario (Dr James F. Berry), 21
Phytiatrie : Phytopharmacie et de (Eighth Symposium on, at the State Agricultural College, Ghent), 779
Phytopharmacie et de Phytiatrie : Eighth Symposium on (State Agricultural College, Ghent), 779
Phytophthora infestans : Field Resistance to Potato Blight (M. J. Deshmukh and H W. Howard), 794
Phytophthora infestans (Mont.) de Bary in Northern Ireland Distribution of Physiological Races of (D. A. Doling), 230
Phytoplancton Le (L. van Meel), 520
Phytoplankton of Lake Tanganyika (Dr Kathleen M. Drew), 520
Phytoplankton Elements : Importance of Smaller (E. J. Ferguson Wood and Peter S Davis) 433
Phytoplankton Outburst in the English Channel : Factors Affecting the Vernal (Dr W. R. G. Atkins and Pamela G. Jenkins), 1218
Phytoplankton and Hydrography of the Pacific Part of the Antarctic Ocean (Grethe Rytter Hasle), 616
Piaget, Prof Jean . The Child's Construction of Reality (translated from the French by Margaret Cook), *review* by Prof. O L. Zangwill, 907
Picciotto, Dr. E., and others : Radioactivity of Iron Meteorites by the Photographic Method, 885
Picken, Dr. Laurence Towards the New Cytology, *review*, 1146
Pickering, F. B : Mechanism of Phase Transformations in Metals, 420
Pickford, Dr Mary : The Neurohypophysis, 1020
Pickman, D. O., and others . Given a Capper Pass Award by the Institution of Mining and Metallurgy and the Institute of Metals, 68
Picton, Harold : *Obituary* by Dr. G. M Bennett, 872
Picture (Motion) . The Theory of Stereoscopic Transmission and its Application to the (Raymond and Nigel Spottiswoode), *review* by Prof. W. D. Wright, 202
Pidgeon (Daniel) Fund for 1956 of the Geological Society of London awarded to Dr. K A. Joysey 1065
Pietsch, Dr. E. : Documentation of Applied Chemistry, 169
Piggery Workers : Leptospirosis in (Dr. H. E. Seiler, J. Norval and Dr. Joyce D Coghlan), 1042
Pigment Spots (Terminal) Role of the, of the Starfish, *Asterias forbesi*, in Light Orientation (Prof. M. Rockstein), 341
Pigment Trichosiderin. The, from Human Red Hair (Dr. N. A. Barnicot), 528
Pigments : The Chemistry of Synthetic Dyes and (edited by H A Lubs), *review* by Dr. S. Coffey, 498
Pigments (Bacterial) . Staining of Wool by (I. E. B. Fraser and A P. Mulcock), 628
Pigments (Red Eye) A Mutant of *Drosophila* without *Iso*xanthopterina which is Non-Autonomous for the (Prof. Ernst Hadorn and Ilse Schwinck), 940
Pigments (White) Effect of some, on the Actinic Degradation of Cotton (W. R Hindson and P. G. Kelly), 1241
Pilcher Memorial Prize of the Royal Aeronautical Society awarded to H. Caplan, 919
Pilot Whale, *Globicephala melaena* : The Carotid Body of the (L. L. de Kock), 1084
Pimblett, A. : Fibre Microscopy, 516
Pincher, Chapman : Organization of Defence Research in Britain, 251
Pincherle, Dr. L. . Appointed to the University of London readership in physics at Bedford College, 415
Pinealectomy : Effect of, on the Rat Pituitary (R. L Holmes), 791
Pinpoint Radiation Counter Diamond as a (W. F. Cotty), 1075
Pinus radiata : Mycelial Aggregation of Sand Soil under (R. H. Thornton, J. D. Cowie and D. C McDonald), 231
Pippard, Dr. A B. : Elected a Fellow of the Royal Society, 559
Pirie, N. W. . Quotation of Titles of Papers in Review Articles, 440
  The Structure of Nucleic Acids and their Role in Protein Synthesis, 602
  The Impact of Food Technology on the Nutrition of Man and Animals, 1200
Pirie, N. W. (edited by Cragg, J. B., and) : The Numbers of Man and Animals, *review*, 300
Pish, G. (Hunt, D J., and) : Spectroscopy, 737
Pitcher, Dr. W. S. . Awarded a moiety of the Lyell Fund for 1956 of the Geological Society of London, 165
Pitressin . An Extrarenal Effect of (Prof Sydney M Friedman, Constance L. Friedman and Miyoshi Nakashima), 1079
Pitt, Frances : Birds and Mammals of Shetland, *review*, 451
  Fifty Years of Birdwatching, *review*, 722
  Rufiji, *review*, 1194
Pitts, Prof. R. F. Elected a Member of the National Academy of Sciences, Washington, 926
Pituitary (Anterior) : Oxytocin as Stimulator for the Release of Prolactin from the (G. K. Benson and Dr. S. J. Folley), 700
Pituitary (Rat) : Effect of Pinealectomy on the (R. L. Holmes), 791
Pituitary Extracts : Inactivation of the Adrenal Ascorbic Acid-depleting Activity of, by Ascorbic Acid (Dr. Marg. Holzbauer and K. Walter), 379

Pituitary Growth Hormone · Effects of, on the Insulin and Hyperglycæmic-glycogenolytic Factor extractable from the Pancreas of Obese-Hyperglycæmic Mice (Dr. D. W. Clarke, Dr. G. A. Wrenshall and Dr. J. Mayer), 1235
Piveteau, Prof. J. : Elected a member of the Geology Section of the Paris Academy of Sciences, 364
Placenta The Mammalian (Prof. J · D. Boyd), 609
Plant . Amino-Acid Metabolism of *Nicotiana* Leaves after Removal from (Shri Ranjan and M. M. Laloraya), 235
Plant Breeders' Conference (Agricultural Research Council), 1113
Plant Cells · A Stimulatory Action of Indole-3-Acetic Acid on the Uptake of Amino-Acids by (Leonora Reinhold and R. G. Powell), 658
Plant Cells (Animal and) : Cultivation of (Dr. Philip R. White), *review* by Prof. R J. Gautheret, 719
Plant Cytoplasm : Relationship between Photosynthesis and a Homogeneous Protein Component of (Dr. J. W. Lyttleton), 283
Plant Growth Auxins and (Prof. A. Carl Leopold), *review* by Prof. L J. Audus, 809
Plant Growth Substances : Chelating Agents as—a Possible Clue to the Mode of Action of Auxin (Dr. O. V. S. Heath and Miss J. E. Clark), 1118
Plant Host Cell : Sporulation of Fungi inside the (Hussein M. Elarosi), 665
Plant Materials Microwave Detection of Metallic Ions and Organic Radicals in (Howard Shields, William B. Ard and Prof. Walter Gordy), 984
Plant Nematodes : 'Solubilized' Chemicals for the Control of (L. N. Staniland), 97
Plant Protection : Bibliography of, 1951 (Biologische Bundersanstalt fur Land- und Forstwirtschaft, Berlin-Dahlem), 1017
Plant Taxonomy : Immunological Methods in (P. G. H. Gell, S. T. C. Wright and Dr. J G. Hawkes), 573
  An Introduction to (George H. M. Lawrence), *review* by Prof. T. G. Tutin, 546
  North-American, *review* by Prof. T. G. Tutin, 546
Plant Tissue Initial Absorption of Ions by (Dr. A. B. Hope and Dr. R. N. Robertson), 43
Plant and Animal Tissue Culture, *review* by Prof. R. J. Gautheret, 719
Plants Fixity in Chromosome Number of (Arun Kumar Sharma and Archana Sharma (*nee* Mookerjea)), 335
  Incorporation of Carbon-14 into the Complex Polysaccharides of (Dr. L Hough and Dr. J B. Pridham), 1039
  Phosphorylation as a Possible Factor in the Pasteur Effect in (Dr. K S. Rowan, Dr. D. E. Seaman and Prof. J. S Turner), 333
  Preservation of Animals and, by Drying from the Frozen State (Dr. D A. L. Davies and V S. G. Baugh), 657
  Some Problems associated with Determining Iron in (Dr. D. J D. Nicholas, C. P. Lloyd-Jones and D. J. Fisher), 336
Plants of *Hibiscus esculentus* L. . Chromatographic Detection of Free Amino-acids in Normal and Iron-deficient (S. D. Démétriadès), 95
Plants Grown at Different Temperatures : Variations in the Amount of Feulgen Stain in Nuclei of (Dr. L. F. LaCour, Dr. E. M. Deeley and Dr. J. Chayen), 272
Plants (Dicotyledonous) : Chromatographic and Spectroscopic Properties of Ellagic Acid, and its Occurrence in (Dr. D. E. Hathway), 747
Plants (Fossil), of the Carboniferous Rocks of Great Britain (Dr. Robert Crookall), (Memoirs of the Geological Survey of Great Britain, Palæontology, Vol. 4, Part 1), *review* by Prof. J Walton, 152
Plasma (Blood), in a Cystinuric Labrador Dog : Amino-Acid Patterns of Urine and (C. W. Crane and A. W Turner), 237
Plasma (Rat and Mouse) : An Erythrocyte Sphering Factor in (Dr. R. Barer and F. M. Gaffney), 277
Plasma Factor(s) influencing Red Cell Production (L. O. Jacobson, L. Plzak, W. Fried and E. Goldwasser), 1240
Plasma Protein as a Precursor of Rat Liver and Hepatoma Protein (Dr. P. N. Campbell, H. E. H. Jones and Nancy E. Stone), 138
Plasmas (Discharge) : The Langmuir Paradox in (Dr. H Martin and Prof. K. G. Emeléus), 943
Plastic Theory of Structures (Symposium at the University of Cambridge), 1208
Platinum (Divalent Palladium and) Some New Stereochemical Arrangements of (Dr. C M. Harris, Prof. R. S. Nyholm and N. C. Stephenson), 1127
Platinum Medal (1956) of the Institute of Metals awarded to Prof. G. L. Chaudron, 16
Platt, Prof. B. S. (Pellett, P. L , and) : A Dietary Defect in Maize developed during Treatment with Lime, 422
Platt, Prof B. S (Wadsworth, Dr G. R , and) · Diet and Anæmia, 878
Platt, G H. . Electrical Supply Systems in the United States, *review*, 297
  Electric Traction Engineering, *review*, 401
  New System of Electrification for British Railways, 867
Platzman, R L. (Miller, W. F., and) : Spectroscopy, 738
Plaut, Walter, and Rustad, Ronald C. : Uptake of Adenine-8-^{14}C by Whole and Fractional Amœbæ, 89
Plotkin, H. H. . Spectroscopy, 737
Plzak, L., and others : Plasma Factor(s) influencing Red Cell Production, 1240
Poetry : Polynesian Tales in, *review* by M. C. Burkitt, 1100
Pohl, Dr. Robert . *Obituary* by Prof. John Greig, 688
Point Source of Cosmic Rays Search for (Y. Sekido, S. Yoshida and Y. Kamiya), 35
Polar Wandering, a Marathon of Errors (Dr. W. H. Munk), 551, *erratum*, 609
Polarity of Environment in the Aerobic Oxidation of Unsaturated Fatty Acids : Metal Ion Catalysis and (Dr. N. Uri), 1177
Polarograph : The Development of the (Prof. J. Heyrovsky), 266
Polarographic Half-Wave Potentials · Correlation of Nuclear Quadrupole Interaction Frequencies with (Dr. T. Iredale), 36
Polarographic Society : Presidential Address (Prof. J. Heyrovsky, The Development of the Polarograph), 266
Polarographically . Formation and Reduction of Zero-Valent Metal Complexes studied (Dr. A. A. Vlček), 1043
Policy on Bread in Great Britain : Revision of the (Miss M. W. Grant), 1150
Policy (University) : The Age-Group Bulge and its Possible Effect on (Universities of Great Britain and Northern Ireland Conference on), 115
Poliomyelitis : The Pathogenesis of (Prof. Harold K. Faber), *review* by Prof. J. M. Yoffey, 450
Polish Academy of Science . Studies and Materials from the History of Polish Science, Vol. 2, 652
Polish Science : Studies and Materials from the History of (Polish Academy of Science), Vol. 2, 652
Political and Economic Planning : British Trade Unionism, new edition *review*, 642
  Broadsheet No. 383, Industrial Trade Associations in Great Britain 1110
  Broadsheet No. 387, Graduates' Jobs, 569
  Broadsheet No. 389, European Coal and Steel Community, 1205
  World Population and Resources, *review* by Maurice Kirk, 5
Politics and Science (William Esslinger), 293
Pollard, Dr. F. H., and Holbrook, K. A. : Reaction between Formic Acid and Nitrogen Dioxide, 799
Pollen . Living and Fossil, from Macquarie Island (John Bunt), 339
Pollen Grains of the *Ephedra* Type in Australian Tertiary Deposits (Dr. Isabel C. Cookson), 47
Pollen Profiles : Refugia Indicated by (C. H. Heusser), 561
Polonium from Nitric Acid Solutions : Solvent Extraction of (J. Danon and A. A. L. Zamith), 746
Polonsky, Mme. Chemistry of Oxygenated Heterocyclic Compounds, 1117
Polska Akademia Nauk : Studia i Materjaly z Dziejów Nauki Polskiej, Tom 2, 652
Polyamides (Cyclic), from Nylon 6 and 6 6 Polymers—Constitution of the Cyclic Polyamides isolated from Nylon 6 Polymers (Dr. P H. Hermans), 126 ; Intramolecular Hydrogen Bonds in certain Cyclic Polyamides (Dr P. H. Hermans), 127 ; Constitution of the Cyclic Polyamides isolated from Nylon 66 Polymer (C. J. Brown, A Hill and P. V. Youle), 128 ; Synthesis of 1 : 8-Diaza*cyclo*-tetradecane (M. A Thorold Rogers), 128
Polycrystalline Metals : Relation between the Initial Instantaneous Extension in Creep and the Yield Stress and Coefficient of Work-hardening in (Dr. Paul Feltham), 632
Polyembryony in *Cassia* (D E. Symon), 191
Polyglycine : Dimorphism of (Dr. A. B. Meggy and Dr. J Sikorski), 326
Polymer (High) Forum : Seventh Canadian (National Research Council of Canada and the Chemical Institute of Canada), 1208
Polymerization . Emulsion (Frank A. Bovey, I. M. Kolthoff, A. I. Medalia and E. J. Meehan), *review* by Prof. G. Gee, 297
Polymerization (Vinyl) Determination of the Rate of Initiation in (Dr. C. H. Bamford, A. D. Jenkins and R. Johnston), 992
  Termination of Chains in, by Metal Salts (Dr. E Collinson and Prof. F S. Dainton), 1224
Polymers (High) : Some Aspects of the Crystallization of (G. Schuur), *review* by Prof H W. Melville, 640
Polymers (Nylon 6 and 6 6) . Cyclic Polyamides from—Constitution of the Cyclic Polyamides isolated from Nylon 6 Polymers (Dr P H. Hermans), 126 ; Intramolecular Hydrogen Bonds in certain Cyclic Polyamides (Dr. P. H. Hermans), 127 ; Constitution of the Cyclic Polyamides isolated from Nylon 66 Polymer (C. J. Brown, A. Hill and P. V. Youle), 128 ; Synthesis of 1 : 8-Diaza*cyclo*-tetradecane (M. A Thorold Rogers), 128
Polymers, Biocolloids and Polyelectrolytes in Solution (Commission on Macromolecules of the International Union of Pure and Applied Chemistry and the Weizmann Institute of Science International Symposium on), 562, 1161
Polymorphism of Alkyl Sulphate Soaps (Prof. J. A Prins and W. Prins), 535
Polymorphism (Chromosomal), in a Bark Weevil (Dr. Stanley G. Smith), 386
Polymorphism and Parthenogenesis in a Ptinid Beetle (Dr. B P. Moore, G. E. Woodroffe and Dr. Ann R. Sanderson), 847
Polynesian Tales in Poetry, *review* by M. C. Burkitt, 1100
Polynucleotide from Adenosine Diphosphate · Enzymic Synthesis and Properties of a (Dr. Roland F. Beers, jun.), 790
Polysaccharides (Complex), of Plants . Incorporation of Carbon-14 into the (Dr. L. Hough and Dr. J. B. Pridham), 1039
Polytechnic Management Association : New Development Series, No 1, New Developments in Industrial Leadership in Great Britain, the United States, Germany and France, 1001
Pomey, Dr. G. Mechanism of Phase Transformations in Metals, 420
Pool and Capillary Feeding in *Aedes aegypti* (L.) : Observations on (Prof Fergus J. O'Rourke), 1087
Poole, Dr. D. F G : Crystallite Orientation in the Tooth Dentine of *Macropus*, 485
Poole, Prof. Granville . *Obituary* of Sir Richard Redmayne, 310
Pope, Elizabeth C · Australian Earthworms, 875
Popper, Prof. K. R. : The Arrow of Time, 538
Population of British Universities in the 1960's—The Age-Group Bulge (Prof R. G D Allen), 115
Population and Resources : World (A Report by P E P), *review* by Maurice Kirk, 5
Population Growth : Physiological Control of (Sir Solly Zuckerman), 58
Population Structure in Salt-Marsh Song Sparrows (Richard F. Johnston), 1157
Populations of House-Mice (R. L. Strecker and John T. Emlen, jun.), 692
Populations (Animal) : Insecticides and the Balance of (Dr. H E. Hinton), 123
Portal Vein (Hepatic) : Flow of Viscous Liquids in Branched Tubes, with reference to the (Dr. C. H. Barnett and Dr. W. Cochrane), 740
Porter, Prof. A. · Guided Missiles, *review*, 1003
Porter, Dr. Helen K. : Elected a Fellow of the Royal Society, 559
Porton : Meteorological Research at (Dr F. Pasquill), 1148
Portuguese Man-of-War : Dimorphism in the (A K. Totton and G. O. Mackie), 290
Positive Contribution by Immigrants (Symposium prepared for Unesco by the International Sociological Association and the International Economic Association), 1164
Positive Identification of certain Monosaccharides from a Salivary Mucoid : Use of the Orcinol—Sulphuric Acid Reaction in the (Dr. M. Irwin and Dr. A. G. Leaver), 1126

Positive Ions of Helium on Nickel · Emission of Photo Radiations by the Impact of (Prof. Rafi M. Chaudhri, Mustafa Yar Khan and Abdul Latif Taseer), 1226
Posnette, A. F. (Frázier, N W., and) Leafhopper Transmission of a Clover Virus causing Green Petal Disease in Strawberry, 1040
Possible Carcinogenic Hydrocarbons from Cigarette Smoke . Assay of (M. J. Lyons), 630
Possible Factor in the Pasteur Effect in Plants . Phosphorylation as a (Dr. K S. Rowan, Dr D E. Seaman and Prof J S. Turner), 333
Possible Mode of Action of 2 . 4-Diamino-5-phenyl-thiazole Hydrochloride (Daptazole or Amiphenazole), (A. Shulman), 703
Possible Uses of Surface Methods as a Means of Testing Metals (with Special Reference to Optical Methods), (Non-Destructive Testing Group of the Institute of Physics Symposium on), 564
Post-doctoral Fellowships Senior (National Science Foundation), 1205
Postgraduate Scholarships in Agricultural Economics, Husbandry, Statistics and Agricultural and Dairy Engineering (Ministry of Agriculture, Fisheries and Food, and the Department of Agriculture for Scotland), 415
Post-Graduate Studies in the Australian Universities . The Place of the Australian University in the Community and (Australian Vice-Chancellors' Committee Symposium on), 1071
Potable Water in Britain · Fluoridation of, 1017
Potassium Ion Stimulation of Hydrocarbon Oxidation by a Soil *Corynebacterium* sp (J N Ladd), 939
Potato Blight (*Phytophthora infestans*) . Field Resistance to (M J. Deshmukh and H W Howard), 794
Potato Clamp : Reproduction of Potato Root Eelworm during the Winter in a (T. J. Legowski and E. B Brown), 287
Potato Leaf-roll Virus : Transmission of the, by Aphids (M. F. Day), 967
Potato Root Eelworm : Reproduction of, during the Winter in a Potato Clamp (T J. Legowski and E. B Brown), 287
Potatoes from Virus Y : Heat Treatment and Tissue Culture as a means of Freeing (A. D. Thomson), 709
Potentials (Polarographic Half-Wave) : Correlation of Nuclear Quadrupole Interaction Frequencies with (Dr. T. Iredale), 36
Potentials (Secretory), and Secretion in the Sublingual Gland of the Cat (Dr. Anders Lundberg), 1080
Potometer (A Simple), for Measuring Rate of Water Uptake by Small Seeds (Dr. Shimon Klein), 707
Potter, Dr. C. : Resistance of Insects to Insecticides, 355
Poulik, M. D. · Tests of Purity of Diphtheria Toxins by Electrophoresis in Starch Gel, 982
Poulik, M. D. (Smithies, Dr. O., and) Two-Dimensional Electrophoresis of Serum Proteins, 1033

Probability and Statistical Inference, *review* by Prof. M. G. Kendall, 679
Probine, M C. (Garvitch, Z. S , and) · Soil Thermometers, 1245
Problems (Human), of Industrial Communities within the British Commonwealth : Conference on, 1113
Problems (Human), of Industrial Leadership, 1001
Problems (Some), associated with Determining Iron in Plants (Dr. D. J. D. Nicholas, C P Lloyd-Jones and D. J. Fisher), 336
Process Industries : Automatic Control in the (Institution of Chemical Engineers and the Society of Instrument Technology Conference on), 252
Processes involved in the Uses of High Temperatures in Science and Industry : Methods, Materials and (Stanford Research Institute and the University of California Symposium on), 693
Product of the Human Blood Group *A* and *B* Genes in Individuals belonging to Group *AB* (Prof. W. T. J Morgan and Dr. Winifred M. Watkins), 521
Production of Gliotoxin in Soils (Joyce M. Wright), 896
Production of Opacity on Serum Agar Plates by some Strains of *Staphylococcus aureus* (A. J. H. Tomlinson and M. T Parker), 895
Production of Pectolytic Enzymes by *Pythium de baryanum* (S. C. Gupta), 739
Production of Self-Reversal of Thermoremanent Magnetism by Heat Treatment of Ferromagnetic Minerals (Prof T Nagata and S. Uyeda), 179
Production of Pure Water : Ion-Exchange Resins for the, 509
Production and Properties of the Pectic Enzymes secreted by *Fusarium moniliforme* (R. K. Singh and R. K S Wood), 738
Production and Utilization of Electromagnetically Enriched Isotopes (Atomic Energy Research Establishment Conference on), 157

Products of Nuclear Explosions : Genetical Effects of Radiations from (Prof F W. Spiers), 226 ; (Prof J B. S Haldane), 227
Professional Man-power Soviet (Nicholas De Witt), 51
Professional Manpower (Scientific and) : Proceedings of a Conference at Columbia University on the Utilization of (National Manpower Council), 675
Professorships . Guest (European Organization for Nuclear Research scheme of), 117
Proficiency (Industrial) : Psychological Tests for Accident Proneness and (E. G. Chambers), (Medical Research Council, Memorandum No 31), 313
Progesterone and 17α-Hydroxyprogesterone : Comparative Antiœstrogenic Potencies of (Dr. Elvira Mardones, Dusan Jadrijevic and Prof. A. Lipschutz), 478
Programme Design for Automatic Digital Computing Machines (Mathematical Laboratory of the University of Cambridge Summer School in), 922
Programmes of Social Development International Survey of (Bureau of Social Affairs of the United Nations Secretariat, in co-operation with the International Labour Office, Unesco, the Food and Agriculture Organization and the World Health Organization), 421
Progress in Biophysics and Biophysical Chemistry (edited by Prof J A. V. Butler and Prof J. T. Randall), Vol. 5, review by Prof F G. Young, 447
Progress in Stereochemistry (edited by Dr. W. Klyne), Vol. 1, *review* by Dr J. W Linnett, 811
Progress in the Study of the British Flora (Botanical Society of the British Isles Conference on), 1162
Progress Medal of the Royal Photographic Society awarded to Dr. J D. Kendall, 361
Prolactin from the Anterior Pituitary . Oxytocin as Stimulator for the Release of (G K. Benson and Dr S J Folley), 700
Proline : Characterization of an Enzyme reducing Pyrroline-5-Carboxylate to (Marion E. Smith and Prof David M. Greenberg), 1130
Prolonged Drought Effect on Crop Growth of Rain after (P. C. Owen and Dr. D J Watson), 847
Pronuclei (Labelled), in Mouse Eggs fertilized with Labelled Sperm (R. G. Edwards and J. L Sirlin), 429
Propagation of an Air-transmitted Shock Wave in Muscular Tissue (Carl-Johan Clemedson, Arne Jonsson and Hjalmar Pettersson), 380
Propagation of Audio-Frequency Radio Waves to Great Distances (Dr. F W. Chapman and R. C. V. Macario), 930
Properties of Diamonds Formation and, 608
Properties of the Enzyme : Synthesis of β-Galactosidase in *Ophiostoma multiannulatum* and some (Dr B v Hofsten), 844
Properties of the Pectic Enzymes secreted by *Fusarium moniliforme* : Production and (R K Singh and R. K S Wood), 738
Properties of a Polynucleotide from Adenosine Diphosphate : Enzymic Synthesis and (Dr. Roland F. Beers, jun), 790
Properties (Bulk Mechanical), of Water Modification of the, by Complex Formation in Dilute Solution (T Nash), 948
Properties (Chromatographic and Spectroscopic), of Ellagic Acid, and its Occurrence in Dicotyledonous Plants (Dr D E Hathway), 747
Properties (Elastic), of Cadmium Dependence of, on Temperature (S V. Subrahmanyam), 852
Properties (Magnetic), of Matter (Italian Physical Society Course on), 1018
Properties (Optical), of Thin Solid Films (Dr. O S. Heavens), *review*, 550
Properties and Distribution of Raw Cotton (Manchester and District Section of the Textile Institute Discussion on), 73
Prophylactic Activity of Suramin Complexes in Animal Trypanosomiasis (Dr J. Williamson and Dr. R. S Desowitz), 1074
Proportion of Fawns to Hinds in Red Deer (*Cervus elaphus*) from several New Zealand Environments Differences in (Thane Riney), 488
Proposed Terminology for Wool Follicles in Sheep (Dr Margaret H. Hardy and A G. Lyne), 705
Propulsion Problems in High-Speed Flight (H Constant), 1196
Proskauer, E S , and others (edited by) : Organic Analysis, Vol. 2, *review* by Dr G M Bennett, 546
Proskauer, E. S (Weissberger, Arnold, and) : Organic Solvents, completely revised second edition by John A. Riddick and Emory E. Toops, Jr., *review*, 639
Prospecting (Seismic) : Improvements in (Royal Astronomical Society Geophysical Discussion on), 1209
Protection against Corrosion Surface Treatment for the Improvement of Mechanical Properties and (Sixth International Mechanical Engineering Congress), 922
Protection of Nature, International Union for the *Bulletin*, Vol. 5, No. 1, Predator Control in America, 1157
Protection of Workers against Ionizing Radiations (International Labour Office), 212
Protection (Nature) : Hydro-Electricity and (prepared by the Rt. Hon. Lord Hurcomb), *review*, 107
Protection (Radiological) Elements of (Course at the Isotope School, Atomic Energy Research Establishment), 364
Protection Service : Radiological, 117
Protein (Hepatoma) : Plasma Protein as a Precursor of Rat Liver and (Dr. P. N. Campbell, H E H Jones and Nancy E. Stone), 138
Protein (Plasma), as a Precursor of Rat Liver and Hepatoma Protein (Dr. P. N Campbell, H E H Jones and Nancy E Stone), 138
Protein Chemistry : Advances in (edited by M L. Anson, Kenneth Bailey and John T. Edsall), Vol 9, *review* by Prof J A. V. Butler, 295
Protein Component (Homogeneous), of Plant Cytoplasm : Relationship between Photosynthesis and a (Dr. J W Lyttleton), 283
Protein Denaturation in Heavy Water (Robert H Maybury and Dr. Joseph J Katz), 629
Protein Factors (Animal), of Casein : Orotic Acid as a Survival Factor in Rats Deficient in the (A. Rabbi, M. Marchetti, R. Viviani and Prof. G. Moruzzi), 757
Protein Fractions isolated from Ehrlich Ascites Carcinoma Cells Immunological Studies with (Dr John S Colter, Hilary Koprowski, Harris H Bird and Kathryn Pfeister), 994
Protein Synthesis . Reticulocyte Enzymes and (Dr Drummond Ellis, C. Elizabeth Sewell and L. G. Skinner), 190
  The Structure of Nucleic Acids and their Role in (Biochemical Society Symposium on), 602
Protein-Sugar Interactions : Infra-Red Absorption Spectra and (J D. S. Goulden), 85
Proteins . Rheology of (British Society of Rheology Symposium on), 516
  The Structural Chemistry of (Prof. H. D. Springall), *review* by Prof. J A. V. Butler, 404
Proteins (Serum) : Two-Dimensional Electrophoresis of (Dr. O. Smithies and M D Poulik), 1033
β-Prothromboplastin (Physiologically Inactive) : Anticoagulant Specificity and (Dr P. Fantl and Dr R J. Sawers), 1233
Protobatrachus massinoti : Status of (I. Griffiths), 342
'Protoplasm' The Word (Dr. Garrett Hardin), 778
Protoplasts (Naked) Regeneration of Yeast Cells from (O. Nečas), 898
Protoxylem of *Cucurbita* . Electron Microscopic Observations on the Secondary Wall of the (C. E. L Hepton, Prof. R D. Preston and G W Ripley), 660
Pryce, Prof M H L. : Theoretical Physics, 269
Pryce-Jones, John . *Obituary* by Prof Paul G 'Espinasse and Prof. Brynmor Jones, 775
Pryor, E. J. An Introduction to Mineral Dressing, *review* by Prof S. G. Ward, 908
Pryor, L. D : Ectotrophic Mycorrhiza in Renantherous Species of *Eucalyptus*, 587
Pseudo-Cholinesterase in the Central Nervous System of the Frog (D. C. Hardwick and Dr Catherine Hebb), 667
Psychiatry, Institute of : Maudsley Monographs, No 1, Suicide in London, an Ecological Study (Peter Sainsbury), *review*, 404
Psychical Research, Society for : Prize for an Essay, 511
Psycho-Analysis and Contemporary Thought (British Psycho-Analytical Society's Lectures to commemorate the centenary of the birth of Sigmund Freud), 363
Psycho-Analytical Society, British : Lectures on Psycho-Analysis and Contemporary Thought, to commemorate the centenary of the birth of Sigmund Freud, 363
Psychological Tests for Accident Proneness and Industrial Proficiency (E. G Chambers), (Medical Research Council, Memorandum No. 31), 313
Psychology at Oxford, 1109
Psychology (Analytical), Journal of, Vol. 1, No 1 (Society of Analytical Psychology), 17
Psychology (Industrial), National Institute of : Vernon Prize for 1956 awarded to Dr. J S Weiner, 464
Psychology (Industrial), National Institute of (Institute of Personnel Management and the) : Course on the Use of Statistics in Personnel Management, 779
Psychology and Medicine : Research Films in Biology, Anthropology, (Anthony R. Michaelis), *review* by Prof G. E. H. Foxon, 298
Psychosomatic Research, Journal of, Vol. I, No. 1, 974
Psychosomatic Research and Behavioural Science (Dr. Clifford Allen), 974
Pteridophyta in the Gold Coast (C. D Adams and A. H. G Alston), 214
Ptinid Beetle : Polymorphism and Parthenogenesis in a (Dr. B. P. Moore, G E. Woodroffe and Dr. Ann R Sanderson), 847
Puberty : Biology of, *review* by Dr. J S Weiner, 860
Public : The Presentation of Science to the (Institute of Biology, the Royal Institute of Chemistry and the Institute of Physics Symposium on), 415, 1066
Public Health Fellowships in Medical Education and (Rockefeller Foundation Awards), 977
Publications (World List of Scientific) Fourth list of amendments to the third edition (Society of Chemical Industry), 1159
Pugh, Dr. J C : Appointed to the University of London readership in geography at King's College, 736
Pullman, Prof. and Mme. Bernard : Awarded the E.S.S.E C. Prize for 1956 for cancer studies by the Ligue Française contre le Cancer, 415
Pumphrey, Dr. W I (prepared by) Research into the Welding of Aluminium and its Alloys (Aluminium Development Association, Research Report No. 27), 568
Pupil and Task : Teacher, (edited by O. A. Oeser), *review*, 250
Pure Water : Ion-Exchange Resins for the Production of, 509
Pure and Applied Chemistry (Analytical Chemistry) . Fifteenth International Congress of, 653
Pure and Applied Chemistry, International Union of : First International Congress on Documentation of Applied Chemistry, 168
  Further Session of the Inorganic Nomenclature Commission, 464
Pure and Applied Chemistry, International Union of (Commission on Macromolecules), and the Weizmann Institute of Science . International Symposium on Macromolecular Chemistry (Polymers, Biocolloids and Polyelectrolytes in Solution), 562, 1161
Pure and Applied Physics, International Union of : Proceedings of the 1954 Glasgow Conference on Nuclear and Meson Physics (edited by E. H. Bellamy and R G. Moorhouse), *review* by Dr. J. C. Bower, 154
  Symposium on X-Ray Microscopy and Microradiography, 1065
Pure and Applied Physics, International Union of (Joint Commission on Spectroscopy) . Meeting at Ohio State University, 693
Pure to Applied Research : The Relation of, in Agriculture, 651
Purely Ionic System The 'Seebeck Effect' in a (H. J. V. Tyrrell, D A. Taylor and C. M Williams), 668
Puri, Dr. G S Appointed regional botanist-in-charge of the northern circle of the Botanical Survey of India, 650 , work of, 650
Purification of a Metal by Zone-refining one of its Salts (J L Richards), 182
Purine Compounds in Snake Venoms (Hazel M Doery), 381
Purity of Diphtheria Toxins Tests of, by Electrophoresis in Starch Gel (M. D Poulik), 982
Purkayastha, S K., and others Septate Fibres in Angiosperms and their Length, 1243
Pursey, Dr D L. : Theoretical Physics, 268
Pyke, Dr. Magnus : Elected a Fellow of the Royal Society of Edinburgh, 507
Pyrrolidone Carboxylic Acid from γ-Glutamyl Peptides : Enzymic Formation of (George E Connell and Prof. Charles S. Hanes), 377
Pyrroline-5-Carboxylate to Proline : Characterization of an Enzyme reducing (Marion E. Smith and Prof. David M. Greenberg), 1130
Pythium de baryanum : Production of Pectolytic Enzymes by (S. C. Gupta), 739

QUADRUPLE Cones in the Retina of the Minnow (*Phoxinus laevis*) : Occurrence of Triple and (Miss A. H. Lyall), 1086
Quadrupole Interaction Frequencies (Nuclear) Correlation of, with Polarographic Half-Wave Potentials (Dr. T. Iredale), 36
Qualitative Inorganic Analysis (Prof. G. Charlot), translated from the fourth French edition by Dr. R. C. Murray, *review* by Prof J. R. Partington, 498
  A New Scheme of, *review* by Prof. J R. Partington, 498
Quality Test in Wheat Breeding : A Small-scale (L. G. Copp), 756
Quantitative Biology : Twenty-first Cold Spring Harbor Symposium on (Genetic Mechanisms—Structure and Function), 877
Quantitative Determination of Acetylcholinesterase Activity in Individual Nerve Cells (Dr. Ezio Giacobini and Dr Joseph Zajicek), 185
Quantitative Method (A New), for Antigen-Antibody Titrations in Gels (Dr Joseph G Feinberg), 530
Quantitative Micro-Analysis · Methods of (collected and edited by Dr. R. F. Milton and Dr. W. A. Waters), second edition, *review* by E Q. Laws, 153
Quantitative Paper Chromatography of Sugars : A New Solvent for (Dr. Giovanni Giovannozzi-Sermanni), 586
Quantum Mechanics (Molecular) : Electronic Computers in, 362
Quantum Theory : Variational Principles in Dynamics and (Dr. Wolfgang Yourgrau and Stanley Madelstam), *review*, 1053
Quarrels . Virtuous, *review* by Dr. E. R Leach, 1098
Quastel, Prof J. H., and others (edited by) : Neurochemistry, *review* by Prof. J. N. Davidson, 811
Quastel, Prof. J. H. (Faulkner, Dr. P., and) : Anaerobic Deamination of D-Glucosamine by Bacterial and Brain Extracts, 1216
Quaternary Ammonium Salts · Effect of the Anion on *RF* Values of (Dr. Herbert Sheppard and Barbara Sachs D'Asara), 1089
Quaternary History of the British Flora (Dr. Harry Godwin), 215
Queen, H.M. the : Birthday Honours, 1061
Queen Mary College, London : Appointment of Dr. K. W. Sykes to the University of London chair of physical chemistry, 68
  Appointment of Dr. Walter Murgatroyd to the University of London chair of nuclear engineering, 70
  Autumn Course in Nuclear Engineering, 653
  Appointment of M. W. Humphrey Davies to the University of London chair of electrical engineering, 736
Queen's University, Belfast : Appointment of Prof. A. V. Stephens to the newly established chair of aeronautical engineering, 507
'Queen-Substance' of Honeybees and the Ovary-inhibiting Hormone of Crustaceans (Dr. David B Carlisle and Dr. Colin G. Butler), 276
Quelea quelea, Linnaeus : Photostimulation of an Equatorial Bird (Dr. A. J. Marshall and H J. de S Disney), 143
Quinn, Prof. David Beers (edited by) : The Roanoke Voyages, 1584–1590—Documents to illustrate the English Voyages to North America under the Patent granted to Walter Raleigh in 1584, *review* by Prof. Arthur Davies, 544
Quinones · Transfer of Hydrogen from Alcohols to (Dr. C. F. Wells), 483
Quirk, Randolph, and others : Studies in Communication contributed to the Communication Research Centre, University College, London, *review* by Prof. G Patrick Meredith, 446
Quotation of Titles of Papers in Review Articles (Dr. Charity Waymouth), 98 ; (N. W. Pirie), 440 ; (Dr. Kenneth M. Smith), 464

RABBI, A., and others : Orotic Acid as a Survival Factor in Rats Deficient in the Animal Protein Factors of Casein, 757
Rabbit Blastocysts · Chromosome Number in (Ole Venge), 384
Rabbit Serum · Effect of Reserpine on Serotonin in (Knut Naess and Mrs. Susan Schanche), 1130
Rabbits : Reciprocal Egg Transplantations to study the Embryo-Uterine Relationship in Heat-induced Failure of Pregnancy in (Dr. M. K. Shah), 1134
Rabbits' Skin Incomplete Wound Contracture and the Phenomenon of Hair Neogenesis in (Dr. R. E. Billingham and Dr P. S. Russell), 791
Racemic Diaminosuccinic Acid : Resolution by means of a Micro-organism of, and Determination of its Configuration (Sakaru Suzuki, Hisao Makishima and Noboru Suzuki), 280
Rachitic Rat Cartilage · Effect of Vitamin D on the Phosphorus Content of (J G. Joshi and P. K. Dikshit), 625
Radar A Textbook of (edited by Dr. E. G. Bowen), second edition, *review* by Dr. R. A. Smith, 202
Radar and Antennas · Elsevier's Dictionary of Television, in Six Languages (compiled and arranged on an English alphabetical base by W. E. Clason), *review* by Dr. R. L. Smith-Rose, 1099
Radcliffe, S. · The Training of University Teachers, 217
Radial Density Distribution in the Tobacco Mosaic Virus Particle : Structure of Tobacco Mosaic Virus— (Dr. D. L. D. Caspar), 928
3 5-m. Radiation : Absorption of, in the Optical Emission Nebula, *NGC* 6357 (B Y. Mills, A. G. Little and K. V. Sheridan), 178
Radiation Counter (Pinpoint) : Diamond as a (W. F. Cotty), 1075
Radiation Monitoring Service in Britain, 117
Radiation-Chimæras . Cytological Identification of (Dr. C. E. Ford, J. L. Hamerton, D W. H. Barnes and Dr. J. F. Loutit), 452
Radiation-induced Genetic Damage : Modification of (Dr. Alexander Hollaender and Dr. R F. Kimball), 726
Radiations from Products of Nuclear Explosions : Genetical Effects of (Prof F W. Spiers), 226 ; (Prof. J. B S. Haldane), 227
Radiations (Ionizing) Effect of Solute Concentration in the Irradiation of Aqueous Solutions by (Dr. G. R. A. Johnson, Dr. G. Scholes and Dr. J. Weiss), 883
  The Protection of Workers against (International Labour Office), 212
Radiations (Photo) . Emission of, by the Impact of Positive Ions of Helium on Nickel (Prof. Rafi M. Chaudhri, Mustafa Yar Khan and Abdul Latif Taseer), 1226
Radicals . Perfluoroalkoxy (D. A. Barr, W. C. Francis and Dr. R. N Haszeldine), 785
Radicals (Organic), in Plant Materials : Microwave Detection of Metallic Ions and (Howard Shields, William B. Ard and Prof. Walter Gordy), 984
Radio : Services' Text-Book of, *review* by C. R. Stoner, 1192
Radio (Continuous-Wave) : A Simple Method of Studying Winds in the Ionosphere by using (Dr. B. Ramachandra Rao and D. Satyanarayana Murty), 1222
Radio Astronomy (Dr J. L. Pawsey and Dr. R. N. Bracewell), *review* by Dr. J. S. Hey, 299
Radio Emission (Monochromatic), of Deuterium from the Galaxy · An Investigation of (G. J. Stanley and R. Price), 1221
Radio and Microwave Frequencies Spectroscopy at (Dr. D. J. E. Ingram), *review* by Dr. D. M. S Bagguley, 1099
Radio Engineers, Institute of, and others : Conference on Magnetism and Magnetic Materials 1065
Radio Noise of Terrestrial Origin (Report of Commission 4 of the International Scientific Radio Union), 652
Radio Telescope in Australia : Projected Giant, 607
Radio Waves (Audio-Frequency) : Propagation of, to Great Distances (Dr. F. W. Chapman and R. C. V. Macario), 930
Radioactivation Analysis of Phosphorus in Iodine (J. A. James and D. H. Richards), 1230
Radioactive Fission Products and Fallout : Relationship between Air Concentration of (I. H. Blifford, jun., L. B. Lockhart, jun., and R A. Baus), 990
Radioactive Fossil Fish from Thurso, Scotland : An Unusually (S. H. U. Bowie and D. Atkin), 487
Radioactive Isotopes in Industry and their Uses as Tracers : The Applications of (College of Technology, Bristol, in collaboration with the Regional Council for Further Education for the South West Course on), 1065
Radioactive Phosphorus : Uptake of, by Larvæ and Adults of Mosquitoes (L. J. Bruce-Chwatt and Dr. J. Hayward), 661
Radioactive Tracer Techniques in Biology, *review* by Dr. E. H. Belcher, 638
Radioactivity of Iron Meteorites by the Photographic Method (S. Deutsch, Dr. E Picciotto and Prof. F. G. Houtermans), 885
Radioactivity Standards : International Comparison of (Dr. A. V. Astin, Sir Edward Bullard and Dr. W. B Lewis), 12
Radioaktiver Strahlen in der Mikrochemie : Messung (Dr. T. Bernert, Dr. B. Karlik und Dr. K. Lintner), *review* by Prof. F. A. Paneth, 953
Radioaktivitat in der Mikrochemie : Verwendung der ; Radiochemische Methoden der Mikrochemie (Dr. E. Broda und Dr. T. Schonfeld), *review* by Prof. F. A. Paneth, 953
Radioautography : Electron Microscopy and, as Coupled Techniques in Tracer Experiments (Dr. J. Liquier-Milward), 619
Radiochemie · Photographische Methoden in der (Dr. H. Lauda), *review* by Prof. F. A. Paneth, 953
Radiochemische Methoden der Mikrochemie : Verwendung der Radioaktivitat in der Mikrochemie (Dr. E. Broda und Dr. T. Schonfeld), *review* by Prof. F. A. Paneth, 953
Radiochemistry (Bradford Chemical Society, the Department of Chemistry and Dyeing of the Technical College, Bradford, and the Yorkshire Council for Further Education, Symposium and Exhibition on), 167
Radio-Frequency Physics . Conference in Geneva (Dr. J. G. Powles), 1022
Radiographic Method for the Study of the Function of the Cow's Udder (Dr. J. Bilek and Dr. M. Janovsky), 582
Radioisotopes in Biology and Agriculture (C. L. Comar), *review* by Dr. E. H. Belcher, 638
Radiological Protection Elements of (Course at the Isotope School, Atomic Energy Research Establishment), 364
Radiological Protection Service, 117
Radiology, British Journal of : Diamond Jubilee Number, 976
Radiometer A Film, for Centimetre Wave-lengths (J A. Lane), 392
Raffinose Fermentation . Complementary Action of Melibiase and Galactozymase on (Prof. O. Winge and Dr. Catherine Roberts), 383
Railways (British) : New System of Electrification for (G H. Platt), 867
Rain after Prolonged Drought : Effect on Crop Growth of (P. C. Owen and Dr. D. J. Watson), 847
Rain-making in Tanganyika, 1204
Rain-making (Artificial), in India : Proceedings of the Symposium on (Atmospheric Research Committee of the Council of Scientific and Industrial Research and the India Meteorological Department), 362
Rainfall (British), during 1953 (Meteorological Office), 313
Raistrick, Prof. Harold · Retirement from the University of London chair of biochemistry in the London School of Hygiene and Tropical Medicine, 1108 ; work of, 1108
Raitt, Dr. R. : Improvements in Seismic Prospecting, 1209
Raleigh, Walter . The Roanoke Voyages, 1584–1590—Documents to illustrate the English Voyages to North America under the Patent granted to, in 1584 (edited by Prof. David Beers Quinn), *review* by Prof. Arthur Davies, 544
Raleigh's Attempted Colonization of Virginia, *review* by Prof Arthur Davies, 544
Ramachandran, Prof. G. N. : Structure of Collagen, 710
Ramakrishna, V. (Elliott R., and) . Insecticide Resistance in *Anopheles gambiae* Giles, 532
Ramakrishnan, Dr. C. V., and others : Spectrophotometric Method for the Estimation of Vitamin K_3, 276
Ramsauer, Prof. Carl *Obituary* by Prof. E. N da C. Andrade, 1154
Ramsay, Miss M. . Appointed a British Rayon Research Association Research Fellow in chemistry in the University of Birmingham, 215
Ramsay Memorial Fellowships for Chemical Research, 653
Ramsey, Prof. Norman F. : Nuclear Moments, *review* by Dr. B. H. Flowers, 497
Rana temporaria Failure of Enforced Hibernation to Inhibit Breeding in the Frog (Dr. Rhoda M Allison), 342
Ranby, B. G. : Electron Microscopy of Fibres, 319
Ranc, Dr. : Production and Utilization of Electromagnetically Enriched Isotopes, 158
Rand, M., and Stafford, Anne : A Method for Determining the Duration of Action of the Cardiac Glycosides, 278
Randall, Prof J. T. (edited by Butler, Prof. J. A. V., and) : Progress in Biophysics and Biophysical Chemistry, Vol. 5, *review* by Prof. F. G. Young, 447

Randall, Dr. William A. (Grove, Dr Donald C , and) : Assay Methods of Antibiotics, *review* by Dr N G Heatley, 496
Randell, P. C. : Appointed conservator of forests, Northern Region, Nigeria, 1112
Random Loads : Fatigue of Metals under (A. K. Head and F. H Hooke), 1176
Random Scatter of Spheres 'Pearl-String' Artefacts in a (J. H. Fessler), 439
Ranjan, Shri, and Laloraya, M M : Amino-Acid Metabolism of *Nicotiana* Leaves after Removal from Plant, 235
Rankine, Prof. A O : Memorial Service for, 167
Obituary by Prof. L. C. Martin, 408
Rao, Dr. B. Ramachandra, and Murty, D. Satyanarayana : A Simple Method of Studying Winds in the Ionosphere by using Continuous-Wave Radio, 1222
Rao, K. N (Nielsen, H. H., and) : Spectroscopy, 738
Raphael, Prof. R. A. : Chemistry of Carbon Compounds, *review*, 1101
Rapid Method for Permanent Aceto-Carmine Squash Preparations (Dr. J. A. Rattenbury), 1185
Rapid Reversible Equilibrium : Boundary Problems in the Sedimentation and Electrophoresis of Complex Systems in (Dr. G A. Gilbert and R. C. Ll Jenkins), 853
Rapid Variable-Temperature Micro- or Macro-Dialyser (Dr. H S Stegemann and Dr. G. Toennies), 440
Raspberry Canes : Effect of Environment upon the Growth and Development of (I. H Williams and Dr. J. P. Hudson), 798
Rat : Effect of Blocking the Reticulo-endothelial System on the Storage of Vitamin A Ester and Alcohol in the Liver of the (Dr S. Krishnamurthy and J Ganguly), 575
Environmental Factors influencing Gonadotrophin Assay in the (Dr. M. R. A. Chance), 228
Influence of Thyro-parathyroidectomy on the Hæmatological Changes induced by Cortisone in the (M. P. Brogi and Q Maggiore), 138
Rat Cartilage (Rachitic) : Effect of Vitamin D on the Phosphorus Content of (J. G. Joshi and P. K. Dikshit), 625
Rat Diaphragm : Length of the Muscle Fibres of the (J. A. B. Barstad, E. Gjone and A M Lovlie), 581
Rat Intestine : Absorption of Vitamin B_{12} from the (Dr. E. S. Holdsworth and M. E. Coates), 701
Rat-Liver Mitochondrial Respiration : Effect of *ββ*-Methylethyl Glutarimide and Amytal on (Prof O Jalling), 330
Rat Liver and Hepatoma Protein : Plasma Protein as a Precursor of (Dr. P. N. Campbell, H. E. H. Jones and Nancy E. Stone), 138
Rat Livers : Preparation of Cell Suspensions from (Dr. I. S. Longmuir and Mrs. Wendy ap Rees), 997
Rat Lymphocytic Leukæmia 8 : Remission of, following Intravenous Administration of 4-(*p*-Diethylaminostyryl)quinoline Dihydrochloride, (Dr. Boland Hughes, Margaret Reed Lewis and Aubrey L. Bates), 331
Rat Pituitary : Effect of Pinealectomy on the (R. L. Holmes), 791
Rat and Mouse Plasma An Erythrocyte Sphering Factor in (Dr. R. Barer and F. M Gaffney), 277
Ratcliffe, J A : Movements in the Ionosphere, 307
Adequacy of the Advanced Level Examinations of the General Certificate of Education as a guide to University Selection, 780
The Place of Science and the Humanities in Education, 962
Rate of Dewfall Measurement of (Dr. G. Hoffmann), 118
Rate of Initiation in Vinyl Polymerization : Determination of the (Dr. C. H. Bamford, A. D. Jenkins and R. Johnston), 992
Rate of Water Uptake by Small Seeds : A Simple Potometer for Measuring (Dr Shimon Klein), 707
Rational Approach to Chemical Principles (Dr. John A. Cranston), second edition, *review* by J. A. V. B., 597
Rats : Effect of Vitamin B_1 Deficiency on Liver Dehydrogenase Activity in (V. Sreenivasa Murthy, H. S. R. Desikachar and M. Swaminathan), 750
Rats Deficient in the Animal Protein Factors of Casein Orotic Acid as a Survival Factor in (A Rabbi, M. Marchetti, R. Viviani and Prof. G. Moruzzi), 757
Rats at various Stages of the Œstrous Cycle Levels of Thyroid and Thyrotrophic Hormones in the Blood of (Dr Fouad A. Soliman and Helmy M Badawi), 235
Rats (Parabiotic) : Fæcal Micro-organisms of (Dr. Helen R. White), 751
Rattenbury, Dr. J. A. A Rapid Method for Permanent Aceto-Carmine Squash Preparations, 1185
Rausch, Prof F. : Chemistry, Biochemistry and Pharmacology of Thioctic Acid, 75
Rauwolscine : Pharmacological Action of (J. D. Kohli and N. N De), 1182
Raven, Canon C. E. : Progress in the Study of the British Flora, 1162
Raw Cotton Properties and Distribution of (Manchester and District Section of the Textile Institute Discussion on), 73
Rawlins, F I G. : Michelangelo, *review*, 451
Parva Naturalia, *review*, 550
Boole's 'The Laws of Thought', 554
Rawlinson, W. A. (Henderson, R W , and) : Oxidation-Reduction Potential of Modified Cytochrome c, 1180
Ray, B. C., and others : Viscosity of Liquids and Ultrasonic Studies, 1227
Raychaudhuri, Dr. S. P. : Soil Science in India (Presidential Address to the Section of Agricultural Sciences of the Indian Science Congress), 1063
Rayon Research Association, British : Open Days, 779, 1160
Rays (Cosmic) Search for Point Source of (Y. Sekido, S. Yoshida and Y. Kamiya), 35
Re-development of the British Museum Library, 734
Reacting (Directly) Form of Bilirubin in Serum : Di- and Mono-Taurobilirubin similar to a (Dr. M. Jirsa, B. Večerek and M. Ledvina), 895
Reaction between Formic Acid and Nitrogen Dioxide (Dr. F. H. Pollard and K. A Holbrook), 799
Reaction (Chain) : Irradiation of Thiourea—Effect of Dose-rate upon the (Dr. W. M Dale), 531
Reaction (Orcinol—Sulphuric Acid) Use of the, in the Positive Identification of certain Monosaccharides from a Salivary Mucoid (Dr. M. Irwin and Dr. A G. Leaver), 1126
Reactions : Organic (edited by Roger Adams, A H Blatt, Arthur C. Cope, David Y Curtin, Frank C. McGrew and Carl Niemann), Vols. 7 and 8, *review* by Prof. John Read, 249
Reactions between Amino-Acids, Organic Acids and Sugars in Freeze-dried Apricots (E F. L. J. Anet and T. M Reynolds), 1082
Reactions (Nuclear) International Conference on (Nederlandsche Natuurkundige Vereniging), 693
Reactions (Superficial), of Gases on Metals (Annual Meeting of the Société de Chimie physique), 693
Reactivitation of Bacteriophage : Multiplicity (H. J. F. Cairns and G. S. Watson), 131
Reactivation of Partially Degraded Tobacco Mosaic Virus (Roger G. Hart), 130
Reactors : Research (prepared by the United States Atomic Energy Commission), *review* by Sir John Cockcroft, 593
Reactors at Harwell : Two new Research, 165
Reactors (Nuclear) : Physics of (Institute of Physics in conjunction with the British Nuclear Energy Conference, Conference on), 831
Reactors (Research) : The Use of, in Nuclear Power Development (H. J. Grout), 205
Two new, at Harwell, 165
Read, Prof. John : Organic Reactions, *review*, 249
Organic Syntheses, *review*, 301
Life and Work of Perkin, 1009
Reade, T. Harold : *Obituary* by Dr. R. B. Strathdee, 917
Reading and Listening Linguistically : New title of the bulletin *Terminological and General Language Review*, 877
Reagent Chemicals and Standards, with Methods of Testing and Assaying Them (Joseph Rosin), third edition, *review*, 550
Reality : The Child's Construction of (Prof Jean Piaget), translated from the French by Margaret Cook, *review* by Prof. O. L. Zangwill, 907
Recherche Agronomique, Institut National de : Annales, Série C, Annales des Épiphyties, Colloque sur l'Acoustique des Orthoptères, Jouy-en-Josas, 5–8 Avril 1954 (René-Guy Busnel), *review* by Dr. P. T. Haskell, 403
Recherche Scientifique, Centre National de la : Scholarships to British workers in Medical Science, 415
Recherche Scientifique en Afrique Centrale, Institut pour la : Sixième Rapport Annuel (1953), 971
Reciprocal Egg Transplantations to study the Embryo-Uterine Relationship in Heat-induced Failure of Pregnancy in Rabbits (Dr. M. K. Shah), 1134
Recording of Animal Sounds (Conference at the Pennsylvania State University), 314
Recording Muscle Contractions in an Insect on a Kymograph : A Technique for (Dr. D. Dresden), 835
Recording (Automatic), of Temperature and Vapour Pressure or Dew-point (Dr U. Berger-Landefeldt), 608
Recording (Magnetic) : Absolute Measurements in (E. D. Daniel and P. E. Axon), 519
Recording (Simultaneous), of Inspired Oxygen Concentration and Peripheral Tissue Oxygenation (Dr. R H. Kay and Dr R. V. Coxon), 45
Recording Machine for Financial Accounting : Electronic, 510
Recruitment of Scientists and Engineers by the Engineering Industry : Report on the (Committee on Scientific Manpower of the Advisory Council on Scientific Policy), 51
Red Beet Root Tissue Inhibition of Salt Absorption in (J. E. Dale and Dr. J. F. Sutcliffe), 192
Red Beet Tissue Effect of Carbon Dioxide on the Manganese Absorption of (A. D Skelding), 1038
Red Cell Production Plasma Factor(s) influencing (L. O Jacobson, L. Plzak, W Fried and E. Goldwasser), 1240
Red-Cell Survival in Familial Hæmolytic Anæmias (Robert L. Evans), 839
Red Deer (*Cervus elaphus*) : Differences in Proportion of Fawns to Hinds in, from several New Zealand Environments (Thane Riney), 488
Red Eye Pigments : A Mutant of *Drosophila* without Isoxanthopterine which is Non-Autonomous for the (Prof. Ernst Hadorn and Ilse Schwinck), 940
Red Fox An Evaluation of the (Thomas G. Scott), 1073
Red Hair (Human) : The Pigment, Trichosiderin, from (Dr. N. A Barnicot), 528
Red Tape A History of—an Account of the Origin and Development of the Civil Service (Sir John Craig), *review* by R B , 154
Redfield, Prof Alfred C. : Awarded the Agassiz Medal of the National Academy of Sciences, Washington, 924 ; work of, 924
Redmayne, Sir Richard : Memorial Service for, 119
Obituary by Prof Granville Poole, 310
Reduction in Growth of Clover due to Applied Molybdenum (R H Jackman), 755
Reduction to Normal Levels of the High Erythrocyte Sedimentation-Rates in Apparently Healthy South African Bantu Men (A. R P Walker, D. C Fletcher, P. A Reynolds, I. Bersohn and E D Sonnenfeld), 480
Reduction of Zero-Valent Metal Complexes studied Polarographically : Formation and (Dr A A. Vlček), 1043
Reduction Product of Vitamin B_{12} : Paramagnetism as a (Dr. F. Grun and R. Haas), 378
Reduction—Oxidation Level of Soils (Carl Goran Lamm), 620
Reece, M. P. : Arcs in Vacuum, 1089
Reed, Dr. R. : Electron Microscopy of Fibres, 319
Reed, Dr. R , and others Connective Tissue and its Changes with Age, 467
Helical Nature of the Collagen Fibril, 697
Rees, A D. : Awarded a research grant by the Leverhulme Trustees, 918
Rees, C W. (Albert, Prof Adrien, and) Avidity of the Tetracyclines for the Cations of Metals, 433
Rees, H (Thompson, J B , and) : Selection for Heterozygotes during Inbreeding, 385
Rees, Mrs. Wendy ap (Longmuir, Dr I S., and) Preparation of Cell Suspensions from Rat Livers, 997
Rees, Dr W. J. : Pelagic Mollusca, 1024
Reference Book Metals (Dr. Colin J. Smithells), second edition, *review* by A. R. Bailey, 642
Refractories Technology at Sheffield, 650
Refrigeration, International Institute of : Joint meeting of Commissions I and II, 1159
Refuges (National) : Seeing America's Wildlife in our (Devereux Butcher), *review* by E. M. Nicholson, 765

Refuges (Wild-Life), in the United States, *review* by E M. Nicholson, 765
Refugia Indicated by Pollen Profiles (C. H. Heusser), 561
Regeneration of Yeast Cells from Naked Protoplasts (O. Nečas), 898
Regional Council for Further Education for the South West (College of Technology, Bristol, in collaboration with the): Course on the Applications of Radioactive Isotopes in Industry and their Uses as Tracers, 1065
Regional Research Laboratory, Hyderabad: Central Laboratories for Scientific and Industrial Research, Hyderabad, formally taken over by the Council of Scientific and Industrial Research, Government of India, and will be known as the, 922
Registrar General . Text Volume of the Statistical Review of England and Wales for the Year 1952, 313
  Medical Tables, Part I (1954), 313
Regularity and Consistency of Design in Living Forms (Dr. P. Weiss), 1157
Regulation Automatic, *review* by R. Neumann, 766
Regulation of Carbohydrate Metabolism: Glucagon and the (Dr. H. Elrick), 892
Regulation of Outbreeding in Field Beans (*Vicia faba*), (Jean M Drayner), 489
Reid, Dr. W. · Elected a Fellow of the Royal Society of Edinburgh, 507
Reid, W. W. . Vegetable Tannins, 880
Reinhold, Leonora, and Powell, R. G.: A Stimulatory Action of Indole-3-Acetic Acid on the Uptake of Amino-Acids by Plant Cells, 658
Reith Lectures for 1956 (Sir Edward Appleton), 364
Relation between the Initial Instantaneous Extension in Creep and the Yield Stress and Coefficient of Work-hardening in Polycrystalline Metals (Dr Paul Feltham), 632
Relation of Pure to Applied Research in Agriculture, 651
Relationship between Air Concentration of Radioactive Fission Products and Fallout (I H. Blifford, jun., L. B Lockhart, jun., and R A. Baus), 990
Relationship between Length of Day and Geotropic Response in Seedlings (E. Dorothy Brain), 323
Relationship between Photosynthesis and a Homogeneous Protein Component of Plant Cytoplasm (Dr. J. W Lyttleton), 283
Relationship (Empirical), between the Excitation Energy of the *F*-band and Physical Constants for Alkali Halides (M. Levy), 241
Relativity, the Special Theory (Prof. J. L Synge), *review* by Prof. H. S. Ruse, 906
Relativity (Special) . A New Synthesis of, *review* by Prof. H. S. Ruse, 906
Relativity and Space Travel (Prof Herbert Dingle), 782, 785; (Prof. W. H. McCrea), 784
Release of Prolactin from the Anterior Pituitary Oxytocin as Stimulator for the (G. K. Benson and Dr. S J. Folley), 700
Religion: Impact of Science on, *review* by the Very Rev. Dr. W. R. Matthews, 638
Remission of Rat Lymphocytic Leukæmia 8 following Intravenous Administration of 4-(*p*-Diethylaminostyryl)quinoline Dihydrochloride (Dr. Boland Hughes, Margaret Reed Lewis and Aubrey L Bates), 331
Removal from Plant: Amino-Acid Metabolism of *Nicotiana* Leaves after (Shri Ranjan and M. M Laloraya), 235
Renantherous Species of *Eucalyptus*: Ectotrophic Mycorrhiza in (L. D. Pryor), 587
Reniform Nematode in the Gold Coast (F. C. Peacock), 489
Rennie Memorial Medal of the Royal Australian Chemical Institute awarded to Dr. D R. Stranks, 919
Rensch, Prof. Bernhard: Elected a Foreign Member of the Linnean Society of London, 1014
Reproduction of Potato Root Eelworm during the Winter in a Potato Clamp (T. J Legowski and E. B. Brown), 287
Reproductive Phenomena in the Badger (*Meles meles* L.) . Ovulation during Delayed Implantation and other (Prof. R J. Harrison and E. G. Neal), 977
Research . Administration of (Proceedings of the Ninth Annual Conference at Northwestern University Technological Institute on the), 676
  Colonial, in the British Commonwealth, 365, 416, *erratum*, 1018
  Engineering, in the Imperial College, London, 570
  Geological and Geomorphological, in the South-West of England (University of Exeter Conference on), 166
  Medical, and its Benefit to Humanity, 362
  Solar Energy (edited by Prof Farrington Daniels and Dr. John A. Duffie), *review*, 1145
  University Expenditure on, 1063
  Veterinary, in Britain, 212
Research at Fort Dunlop, Birmingham, 650
Research in Great Britain: Government Support for, 761
Research on Ageing, British Society for Conference on Connective Tissue and its Changes with Age, 467
  Joint meeting with Dutch gerontologists, 1159
Research on Diseases of the Blood, with special reference to Leukæmia (Lady Tata Memorial Fund Grants, Scholarships or Fellowships for), 415, 1208
Research on the Humid Tropics—the Unesco Programme (Prof P. W. Richards), 1010
Research in Industry in Great Britain (Dr B K. Blount), 412
Research on Leukæmia and allied Diseases (Lady Tata Memorial Fund Awards for 1956–57), 1208
Research in Marine Biology or Oceanography: Grants for (Challenger Society), 1018
Research in Marine or Freshwater Science . Grants for (Development Commission), 736
Research into Problems of European interest . Fellowships for (Council of Europe and the High Authority of the European Coal and Steel Community), 263
Research in Semiconductors—Symposium at Ottawa (Dr. T. H. K. Barron), 833
Research on Tuberculosis and Leprosy, *review* by Dr. Derek Hobson, 448
Research into the Welding of Aluminium and its Alloys (Aluminium Development Association, Research Report No. 27, prepared by Dr. W. I. Pumphrey), 568
Research (Agricultural): The Evolution of (Sir William Slater), 651
  Government Support of, in Britain, 68
  in Scotland, 607
Research (Applied): The Relation of Pure to, in Agriculture, 651
Research (Chemical) Ramsay Memorial Fellowships for, 653
Research (Clinical) Fellowships in (Medical Research Council), 70
Research (Colonial): Scientists for, 734
Research (Defence), in Britain: Organization of (Chapman Pincher), 251
Research (Forestry) New Zealand, 117
Research (Fundamental) Human Motives in, 951
Research (Geometrical): K. W Feuerbach and his (Prof Laura Guggenbuhl), 921
Research (Geophysical) in Pakistan (Meteorological Service of Pakistan, Geophysical Review, Part 4, Technical Progress No. 7), 1158
Research (Government) . Control of, in Britain, 805
Research (Industrial) · Government Responsibility in (Society for Visiting Scientists Discussion on), 171
Research (Medical): Beit Memorial Fellowship Awards for, 965
  Grants-in-aid for (Life Insurance Medical Research Fund of Australia and New Zealand), 511
  Humanity's Rising Debt to (Sir Henry Dale), 362
Research (Meteorological), at Porton (Dr. F. Pasquill), 1148
Research (Nuclear): European Co-operation in (Unesco and its Programme, No 11), 397
Research (Nuclear), European Organization for: Scheme of Guest Professorships, 117
  Election of Officers, 117
  Symposium on High-Energy Physics, 117, 1065
Research (Psychosomatic), and Behavioural Science (Dr. Clifford Allen), 974
Research (Recent Soviet), on Microbiology in the Arctic and other Regions (W G. Cass), 654
Research (Rheological), in the Textile Industry (British Society of Rheology Symposium on), 877, 1018
Research (Scientific) Cinematography in, *review* by Prof. G. E H. Foxon, 298
Research (Scientific), in British Universities, 1954–55 (Department of Scientific and Industrial Research), 828
Research Associations: Development of, 1018
Research Defence Society: Stephen Paget Memorial Lecture (Sir Henry Dale), 362
Research Fellowships (Life Insurance Medical Research Fund of Australia and New Zealand) 511
Research Fellowships in Tuberculosis: Dorothy Temple Cross (Medical Research Council), 215
Research Films in Biology, Anthropology, Psychology and Medicine (Anthony R Michaelis), *review* by Prof. G. E. H Foxon, 298
Research Flight (Meteorological) · The Free Atmosphere in the Vicinity of Fronts—Analysis of the Observations by the, 1950–52 (J. S. Sawyer), 656
Research Grants: Leverhulme Fellowships and (Awards for 1956), 918
Research Laboratories: New Underwater Hydrodynamic (F. S Burt), 108
Research Medal of the Royal Agricultural Society of England, 17
Research Reactor of the 'Swimming-pool' pattern under construction at the Atomic Energy Research Establishment, for the study of shielding problems, 777
Research Reactors (prepared by the United States Atomic Energy Commission), *review* by Sir John Cockcroft, 593
Research Reactors at Harwell Two New, 165
Research Reactors in Nuclear Power Development . The Use of (H. J. Grout), 205
Research Scholarship in the techniques of Organic Chemistry Ciba (University of Birmingham), 693
Research Students in the United States of America (H. N V. Temperley), 455
Research Work in the City and Guilds College, 1952–55: Report on (Imperial College of Science and Technology), 570
Research and Development in the Electricity Supply Industry, 541
Researches in the Arctic Ocean (Prof. G. E. MacGinitie), 1215
Reserpine Effect of, on Serotonin in Rabbit Serum (Knut Naess and Mrs. Susan Schanche), 1 30
Resins: Epoxide—their Chemistry and Structure in relation to their Properties and Applications (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 962
Resins (Anion Exchange) Adsorption of Trace Amounts of Cations on, by the Formation of Insoluble Salts (R. H. James and G. A. Welch), 183
Resins (Ion-Exchange), for the Production of Pure Water, 509
Resistance of Insects to Insecticides (Association of Applied Biologists and the Society of Chemical Industry Symposium on), 355
Resistance-levels (Normal), of *Anopheles gambiae* to various Insecticides (Dr. J. R. Busvine) 533
Resolution by means of a Micro-organism of Racemic Diaminosuccinic Acid and Determination of its Configuration (Sakaru Suzuki, Hisao Makishima and Noboru Suzuki), 280
Resonance (Paramagnetic): Analysis of Crystalline Hæmoglobin Derivatives by (J E. Bennett and Dr. D. J. E Ingram), 275
Resource-Use: Handbook for Teaching of Conservation and (prepared by the National Conservation Committee of the National Association of Biology Teachers in conjunction with the American Nature Association), *review* by Dr. Maurice Ashby, 678
Resources: World Population and (A Report by P E P), *review* by Maurice Kirk, 5
Respiration (Discontinuous), in Insects: Spiracular Control of (Dr. Howard A. Schneiderman), 1169
Respiration-rate of Buffaloes and Friesian Cattle . Effects of Climate on Body Temperature and (Dr. K. A. Alim and I. A. Ahmed), 900
Respiratory Disease of Turkeys . A Virus in Chronic (J. A. Fahey), 90
Respiratory Rate of *Trypanosoma vivax*: Effect of Antibody on the (Dr. R S Desowitz), 132
Response of Chickens to Folic Acid Effect of Supplementary Choline and Methionine on the (M. W. McDonald), 343
Responses of Domestic Animals to Infections of *Trypanosoma vivax*, *T. congolense* and *T. brucei* (Prof. E E. Edwards, J. M. Judd and F. A. Squire), 332
Responses (Alternative): A Combinatorial Design for Experiments with (K. Strzemienski), 283

Responsibility (Government), in Industrial Research (Society for Visiting Scientists Discussion on), 171
Resting Yeast . Incorporation of Adenine and Uracil into Ribonucleic Acid during Enzyme Induction in (Prof. H Chantrenne), 579
Reticulo-endothelial System : Effect of Blocking the, on the Storage of Vitamin A Ester and Alcohol in the Liver of the Rat (Dr S Krishnamurthy and J Ganguly), 575
  Effect of Cortisone on the (Prof. T. Nicol and R. S. Snell), 430
Reticulocyte Enzymes and Protein Synthesis (Dr. Drummond Ellis, C. Elizabeth Sewell and L. G Skinner), 190
Retina : Flash Photolysis of Rhodopsin in the (Dr. W. A. Hagins), 989
  Stabilized Interference Fringes on the (Prof. R. W. Ditchburn and R. M. Pritchard), 434
Retina of the Minnow (*Phoxinus laevis*) : Occurrence of Triple and Quadruple Cones in the (Miss A. H Lyall), 1086
Retinula (Insect) : Fine Structure of the, as revealed by Electron Microscopy (Dr. Humberto Fernández-Moran), 742
Réunion Internationale des Laboratoires d'Essais et de Recherches sur les Materiaux et les Constructions : Proceedings of the International Symposium on Non-Destructive Testing of Materials and Structures, 468
Reversal of Mating Preference by Crossing Strains of *Drosophila melanogaster* (G. Tebb and Dr. J. M. Thoday), 707
Reversed-Phase Paper-Partition Chromatography : Separation of the Isomers of Benzene Hexachloride by (R. G. Bridges, A. Harrison and F. P. W. Winteringham), 86
Reversible Equilibrium : Boundary Problems in the Sedimentation and Electrophoresis of Complex Systems in Rapid (Dr. G. A. Gilbert and R. C. Ll. Jenkins), 853
Reversible First-Order Phase Transition in Collagen–Diluent Mixtures (R. R. Garrett and Prof. P. J Flory), 176
Reversible, Host-induced, Changes in a Strain of Tobacco Mosaic Virus (F. C. Bawden), 302
Review of Czekoslovak Medicine, Vol. 1, No. 1, 1205
Review Artidles : Quotation of Titles of Papers in (Dr. Charity Waymouth), 98 , (N. W. Pirie), 440 , (Dr Kenneth M Smith), 464
Rey, Prof M. . Given a Capper Pass Award by the Institution of Mining and Metallurgy and the Institute of Metals, 68
Reynolds, P. A., and others : Reduction to Normal Levels of the High Erythrocyte Sedimentation-Rates in Apparently Healthy South African Bantu Men, 480
Reynolds, T M. (Anet, E. F. L. J , and) : Reactions between Amino-Acids, Organic Acids and Sugars in Freeze-dried Apricots, 1082
R_F Values of Quaternary Ammonium Salts · Effect of the Anion on (Dr. Herbert Sheppard and Barbara Sachs D'Asara), 1089
Rheological Research in the Textile Industry (British Society of Rheology Symposium on), 877, 1018
Rheology, British Society of : Symposium on the Rheology of Proteins, 516
  Symposium on Rheological Research in the Textile Industry, 877, 1018
Rheology of Proteins (British Society of Rheology Symposium on), 516
Rhizobium Strain · Influence of Day-length on Nodule Formation in *Soja hispida* by a Specific (Ch Bonnier and C Sironval), 93
Rhizobium trifolii Effect of Hormone Herbicides on the Growth of (Dr. Wm W. Fletcher), 1244
  A Lysogenic Strain of (K. C. Marshall), 92
Rhizoctonia in Natural Grassland Soils (R. H. Thornton), 230
Rhoads, Cornelius P. (edited by) : Antimetabolites and Cancer, *review* by G. M. Timmis, 1007
Rhodes, Dr. D. N. · Phospholipids in Foods, 565
Rhodes, Dr. D. N., and Lea, Dr. C H. Composition of Egg Phospholipids, 1129
Rhodes Trust : Education and the, 347
  The First Fifty Years of the, and the Rhodes Scholarships, 1903–1953 (edited by Lord Elton), 347
Rhodium Olefin Complexes of (Dr. J. Chatt and L. M. Venanzi), 852
Rhodopsin Synthesis and Bleaching of (Dr. George Wald and Paul K. Brown), 174
Rhodopsin in the Retina : Flash Photolysis of (Dr. W A Hagins), 989
Rhythmic Biting Activity of certain East African Mosquitoes (Dr. A. J. Haddow), 531
Ribbon Type Pressure-Gradient Microphone for Broadcast Transmission · Design of a (D. E. L. Shorter and H D Harwood), 519
Ribonuclease . Action of, on the Multiplication of the Influenza Virus (Miss J. Le Clerc), 578
Ribonucleic Acid · Incorporation of Adenine and Uracil into, during Enzyme Induction in Resting Yeast (Prof. H. Chantrenne), 579
  Infectivity of, from Tobacco Mosaic Virus (Dr. A Gierer and Prof. G Schramm), 702
Ribonucleic Acid in the Tobacco Mosaic Virus Particle : Structure of Tobacco Mosaic Virus—Location of the (Dr. Rosalind E. Franklin), 928
Rice, D K. . Spectroscopy, 737
Rice, E P. . Appointed deputy director of veterinary services, Kenya, 831
Rice : γ-Tocopherol (7-Methyltocol), a New Tocopherol in (J. Green and S. Marcinkiewicz), 86
Richard, Dr. A. J . Low-Temperature Crystallography, 1068
Richards, Dr A. I. : Awarded a Fellowship by the Leverhulme Trustees, 918
Richards, D. H. (James, J. A., and) : Radioactivation Analysis of Phosphorus in Iodine, 1230
Richards, Dr. F. J. Leaf Growth, 1114
Richards, J. L : Purification of a Metal by Zone-refining one of its Salts, 182
Richards, Prof. P. W. : Appointed a member of the National Parks Commission, 167
  Research on the Humid Tropics—the Unesco Programme, 1010
  Progress in the Study of the British Flora, 1163
Richards, Dr. T. · *Obituary* by Prof. B. C. J. G Knight, 1060
Richards, Dr T. Ll. . Mechanism of Phase Transformations in Metals, 420
Richardson, Prof. C. H · An Introduction to the Calculus of Finite Differences, *review*, 680
Richardson, D. A. : Appointed veterinary officer, Nyasaland, 1112
Richardson, Dr. E. G. : Awarded a Fellowship by the Leverhulme Trustees, 918
  Appointed to a personal professorship of acoustics in the Newcastle Division of the University of Durham, 1110
Richardson, Dr F. D : Given an award from the Sir George Beilby Memorial Fund, 507 , work of, 508
Richardson, Prof. H. O. W. : Appointed to the Hildred Carlile chair of physics in Bedford College, 70, 311 , work of, 311
Richardson, R K. : Appointed senior agricultural officer, Jamaica, 1207
Richmond, Prof I. A. Appointed to the chair of archæology of the Roman Empire in the University of Oxford, 164 ; work of, 164
Ricinus communis · Biosynthesis of Fatty Acids by Seeds of (N Coppens), 279
Riddell Memorial Lectures (Prof. R O. Kapp), 369
Rideal, Sir Eric . Colloids and their Behaviour, 263, 865
Riedesel, Marvin L , and Folk, jun., G. Edgar : Serum Magnesium Changes in Hibernation, 668
Riemannian Geometry Results of Gravitational Significance in (Prof. V. V. Narlikar), 1138
Riesz, Prof. F. : *Obituary* by Dr. F. Smithies, 870
Rigby, Dr. C. M. : The Age-Group Bulge and its Possible Effect on University Policy, 116
Riis, Dr Povl (Fuchs, Dr. Fritz, and) : Antenatal Sex Determination, 330
Riley, D. P. Low-Temperature Crystallography, 1069
Riney, Thane · Differences in Proportion of Fawns to Hinds in Red Deer (*Cervus elaphus*) from several New Zealand Environments, 488
Ripamonti, A., and others · Isosterism and Molecular Fourier Transform—Crystal Structure Determination of 2-4-Dihydroxybenzoic Acid as related to that of 2-Hydroxy-4-aminobenzoic Acid, 944
Ripley, G. W., and others : Electron Microscopic Observations on the Secondary Wall of the Protoxylem of *Cucurbita*, 660
Ritter, Hilda B., and others : Nucleic Acid Content and Distribution of Chromosome Number in Original and Sublines of Two Mouse Ascites Tumours, 993
River : Call of the (Mabel E. Byrt), *review* by F. P., 814
Road Research Laboratory · Final Report on Direction Indicators for Motor-Vehicles, 1016
Road Transport Human Factors in (Ergonomics Research Society Symposium on), 314
Roanoke Voyages, 1584–1590—Documents to illustrate the English Voyages to North America under the Patent granted to Walter Raleigh in 1584 (edited by Prof. David Beers Quinn), *review* by Prof. Arthur Davies, 544
Robbins, B G. Fellowship of the City and Guilds of London Institute conferred on, 363
Roberts, Dr Catherine (Winge, Prof. O., and) : Complementary Action of Melibiase and Galactozymase on Raffinose Fermentation, 383
Roberts, Dr. E. A. H. Vegetable Tannins, 880
Roberts, F., and others : The Flying-Spot Monochromatic Ultra-Violet Television Microscope, 1172
Roberts, Miss F. M. : Appointed principal scientific officer, plant pathologist, Kenya, 561
Roberts, Dr. J. C. : Antibiotics and Mould Metabolites, 1058
Roberts, Prof. J D. : Elected a Member of the National Academy of Sciences, Washington, 926
Roberts, Richard B , and others : Studies of Biosynthesis in *Escherichia coli*, *review* by Dr. Kenneth McQuillen, 594
Roberts, Dr. W. T. Mechanism of Phase Transformations in Metals, 420
Robertson, Dr. Alexander, and others : Antibiotics and Mould Metabolites, 1058
Robertson, Dr. A. J. B. : Appointed to the University of London readership in physical chemistry at King's College, 736
Robertson, Dr. J. H. : Low-Temperature Crystallography, 1068
Robertson, Prof. J. Monteath, and Shearer, Dr. H. M. M. : Structure of Azulene, 885
Robertson, Dr. R. N. (Hope, Dr. A. B., and) : Initial Absorption of Ions by Plant Tissue, 43
Robertson (W. H. A) Medal (1955) of the Institute of Metals awarded to E. J Thackwell, 16
Robin, G. de Q · Determination of the Thickness of Ice Shelves by Seismic Shooting Methods, 584
Robinson, Dr. Conmar Semi- and Non-Crystalline Materials, 122
Robinson, E. A., and others : The *Diego* Blood Factor, 40
Robinson, F. D. : Heat and Mass Transfer in Combustion Theory, *review*, 548
  Automobile Free-Piston Engines, 914
Robinson, Dr. Harry J . Appointed director of the Rahway unit of the Merck Institute for Therapeutic Research, 828
Robinson, Dr. P. L . Appointed to a personal professorship of inorganic chemistry in the Newcastle Division of the University of Durham, 1110
Rock Paintings and Engravings in Hyderabad (Colonel D. H. Gordon and Dr. F. R. Allchin), 1063
Rockefeller Foundation, New York : Grants, 976
  Fellowships, 977
  Election of Dr Lee A. DuBridge as a member of the Board of Trustees, 1018
Rockefeller Travelling Fellowships in Medicine (Medical Research Council), 215
Rocket Exploration of the Upper Atmosphere (Dr. F. E. Jones and Prof. H. S. W. Massey), 643
Rockstein, Prof M. Role of the Terminal Pigment Spots of the Starfish, *Asterias forbesi*, in Light Orientation, 341
Rodd, Dr. E. H. (edited by) : Chemistry of Carbon Compounds, Vol 3, Part A, Aromatic Compounds, *review* by Prof. R A. Raphael, 1101

Rosengren, Bengt H. O. : X-Ray Mass Determination in Cells by Scanning, 1127
Rosenhain Medal (1956) of the Institute of Metals awarded to Dr. D. McLean, 16
Rosenhead, Prof. L. : Springboard for Supersonic Flight, *review*, 400
Rosin, Joseph : Reagent Chemicals and Standards, with Methods of Testing and Assaying Them, third edition, *review*, 550
Ross, Dr. W C. J. (Haddow, Prof. A., and) . Tumour Growth-inhibitory Alkyl Sulphonates, 995
Ross Institute : Course on Tropical Hygiene for Laymen, 922
Rossini, Prof. Frederick D. (edited by) · Thermodynamics and Physics of Matter, *review* by Prof L. Rosenhead, 400
Rossini, Prof. Frederick D., and others : Hydrocarbons from Petroleum, *review*, 401
Rossiter, Dr. R. J. : Metabolism and Function of Phospholipids, 22
Rotary Film Evaporator : A Simple Spinning Joint for a (K. L. Bocock and Dr. O. Gilbert), 439
Rothamsted Experimental Station : Appointment of Dr G. W. Cooke as head of the Chemistry Department, 559
  Appointment of Dr. Alexander Muir as deputy director (Soils Division), 609
Round, M C. : Appointed field zoologist, Veterinary Department, Kenya, 70
Rous, Dr. Peyton Awarded the Kovalenko Medal of the National Academy of Sciences, Washington, 924 , work of, 925
Rout, E R., and others : The Suppressed Frame System of Telerecording, 519
Rout, H. K., and others · Viscosity of Liquids and Ultrasonic Studies, 1227
Rowan, Dr. K. S., and others : Phosphorylation as a Possible Factor in the Pasteur Effect in Plants, 333
Rowe, A. H. : Mechanism of Phase Transformations in Metals, 420
Royal Academy of Sciences in Sweden . Election of Prof T. H. Goodspeed, Dr. Mervin J. Kelly and Sir Geoffrey Taylor to foreign membership, 70
Royal Aeronautical Society : Honorary fellowship conferred on Sir Roy Dobson and Dr. Hugh L. Dryden, 919
  Awards, 919
  Election of Officers for 1956–57, 1112
Royal Agricultural Society of England . Research Medal for work on Agriculture, 17
Royal Air Force Man-power in the (Nigel Birch), 560 ; (G S. de Freitas), 560 ; (Dr A. D. D. Broughton), 560
Royal Astronomical Society : Gold Medal awarded to Prof. T. G. Cowling, 119
  Geophysical Discussion on Movements in the Ionosphere, 307
  Election of Officers for 1956, 314
  Geophysical Discussion on Improvements' in Seismic Prospecting, 1209
Royal Australian Chemical Institute Awards, 919
Royal Dublin Society : The Story of the (Terence de Vere White), *review* by Sir Nigel Ball, 295
Royal Geographical Society · Medals and Awards for 1956, 606
Royal Holloway College : Appointment of Dr O S. Heavens to the University of London readership in experimental physics, 736
Royal Horticultural Society Index to Vols 1–164 of *Curtis's Botanical Magazine* (F. J Chittenden), 735
Royal Institute of Chemistry : Lectures, No. 5, Chemistry and Crop Nutrition (Sir William Ogg), 208
  Monograph No. 3, The Chemical Background of the Aluminium Industry (Dr. T. G. Pearson), 462
  Symposium on Recent Advances in the Chemistry and Industrial Applications of Cereals, 1018
Royal Institute of Chemistry, and others : Symposium on the Presentation of Science to the Public, 415, 1066
  Perkin Centenary Celebrations, 1009
Royal Institution · Lectures by Sir Eric Rideal on Colloids and their Behaviour, 263, 865
  Election of Officers 876
Royal Irish Academy . Proceedings, Vol. 57, Section A, No 6. Celebration of the Centenary of 'The Laws of Thought' by George Boole, 554
Royal Meteorological Society . Symposium on Turbulence in the Atmosphere, 13
  Symposia on Statistics and Aerodynamics of the Sea Surface, 62
  Prize for an essay on the Place of Meteorology in Liberal Education, 415
  Awards, 1014
  Summer Meeting, 1065
  Napier Shaw Memorial Prize awarded to Dr. Norman A. Phillips, 1203
Royal Meteorological Society and the British Glaciological Society Discussion on Snow Accumulation and Ablation, 563
Royal Meteorological Society (Physical Society and the) : Conference on Cloud Physics, 320
Royal Meteorological Society (Field Studies Council and the) : Vacation Course in Meteorology, 922
Royal Microscopical Society (Industrial Section) · Symposium and Exhibition on Fibre Microscopy, 515
Royal Photographic Society : Silver Progress Medal awarded to Dr. J D. Kendall, 361
Royal Photographic Society (Scientific and Technical Group) : Conference on the Science and Technique of Photography, 736
Royal Society of Arts : Trueman Wood Memorial Lecture (Prof. E. N da C. Andrade), 164
  E. F Armstrong Memorial Lecture (Dr. B. K. Blount), 412
Royal Society of Edinburgh : New Fellows, 506
  Keith Prize for 1953–55 awarded to Prof. A D Peacock, 507
  Neill Prize for 1953–55 awarded to Dr. Robert Osborne, 507
Royal Society of London : Mackinnon Research Studentship awarded to Dr. C. J. Waddington, 215
  New Fellows of the, 558
  Antarctic Station in Coats Land, Antarctica, to be called Halley Bay, 606
  New Foreign Members, 827, 918
  Delegation to Moscow, 828
  Meeting on Immunological Tolerance, 869
  Accessions to the Depository of Unpublished Mathematical Tables, 921
  Election of Prof. R. B. Woodward as a Foreign Member, 965
  Appointment of Prof. E. N. da C Andrade to deliver the Rutherford Memorial Lecture for 1957, 1113
  Appointment of A. M. Segar as a Rutherford Scholar, 1113
  Lecture by Sir K S Krishnan on the Scientific and Technical Work of the National Physical Laboratory of India, 1113
Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme : Awards, 165
Royal Society, and others Perkin Centenary Celebrations, 1009
Royal Society of Medicine (Section of Comparative Medicine) . Discussion on Learning in Man and Animals, 1147
Royal Society of Medicine (Section of Experimental Medicine and Therapeutics) Symposium on Anti-tumour Agents, 511
Royal Society of South Africa : Election of Officers for 1956, 1112
Royal Society of Tropical Medicine and Hygiene : Manson Medal for 1956 awarded to Brigadier J. A. Sinton, 562
Royal Spanish Academy of Pharmacy : Election of T D. Whittet as a Foreign Member, 1018
Royal Veterinary College, Sweden : Grant from the Rockefeller Foundation, New York, for equipment for animal physiology, 977
Rubber (Bonded), in Compression : Effect of Shape on the Static and Dynamic Stress-Strain Relationship of (A. R. Payne), 1174
Rubber Trees : Stimulation of Yield from (E. D C. Baptist and P. de Jonge), 1073
Rubbo, Prof S. D , and others : Mode of Action of *Iso*nicotinic Hydrazide, 480
Rudall, K. M : Electron Microscopy of Fibres, 319
Rufiji (R. de la Bere Barker), *review* by Frances Pitt, 1194
Rugby (*GBR*) : Frequency Variations in New Zealand of 16 kc./s. Transmissions from (A. H Allan, D D Crombie and W. A. Penton), 178
Ruinen, Dr. J. : Occurrence of *Beijerinckia* Species in the 'Phyllosphere', 220
Ruminants : Heat Increments of Feeding in (D. G. Armstrong and K. L. Blaxter), 1183
Runcorn, Dr. S. K.: Appointed professor of physics in King's College, Newcastle-upon-Tyne, 411 ; work of, 411
Rural Life (English), Museum of (Reading) First Annual Report, 1156
Ruse, Prof. H. S A New Synthesis of Special Relativity, *review*, 906
Russell, Sir John · Food Problems in the United States, *review*, 349
Russell, Prof. L J. : The Metaphysical Strain in Kant, *review*, 152
Russell, P. · A Selective Medium for the Isolation of Basidiomycetes, 1038
Russell, Dr. P. S. (Billingham, Dr. R. E , and) . Incomplete Wound Contracture and the Phenomenon of Hair Neogenesis in Rabbits' Skin, 791
Russell, W. J. : Appointed a member of the Advisory Council of the Commonwealth Scientific and Industrial Research Organization, 734
Rustad, Ronald C (Plaut, Walter, and) · Uptake of Adenine-8-^{14}C by Whole and Fractional Amœbæ, 89
Rutherford Memorial Lecture for 1957 of the Royal Society (Prof. E N. da C. Andrade), 1113
Rutishauser, Dr. A , and La Cour, Dr. L. F. · Spontaneous Chromosome Breakage in Endosperm, 324
Rutter, J. W : Melting, Diffusion and related topics, 23
  Semiconductors, 833
Ruzička, Dr Primus: Diamant, 608
Ryegrass (Perennial) : Components of the Total Magnesium Content within the Leaves of White Clover and (T F Neales), 388
Rylands, J R. : Elected president of the Institute of Fuel, 1015 ; work of, 1015
Ryle, M. · Movements in the Ionosphere, 308
Ryle, Margaret, and Simonsen, M : Attempts at Hybridization of Chickens and Turkeys which are Tolerant of each other's Antigens, 437

SACCHAROMYCES cerevisiae (Haploid and Diploid): Dominant Lethality induced by X-Rays in (M. E. Owen and R. K. Mortimer), 625
Sadhu, Prof. D. P.: Lactose as a Lipotropic Agent, 1236
Sadron, Prof. Ch.: The Morphology of Large-Chain Molecules, 205
Saez, Dr. Francisco-A.: Cytogenetics of South American Orthoptera, 490
Safety in a Nuclear Power Industry: Health and (A. S. McLean and W. G. Marley), 205
Safety and Health in Industry, 493
Sagalyn, P. L.: Spectroscopy, 737
Saha, Prof. Megh Nad: *Obituary* by Prof. F. J. M. Stratton, 917
  Fuel in India, 923
Sainsbury, Peter: Suicide in London, an Ecological Study (Institute of Psychiatry, Maudsley Monographs No. 1), *review*, 404
Saint, Dr. E. G.: Appointed to the chair of medicine in the Medical School of the University of Western Australia, Perth, 1065
Salaman, Dr. M. H.: Infections in Laboratory Animals, 1198
Salisbury, Sir Edward: Fruit and Seed Production, 64
  Science and Education (Presidential Address to the Science Masters' Association), 170
  Asiatic Magnolias in Cultivation, *review*, 549
Saliva (Parotid), of Sodium-depleted Sheep: Delayed Effect of Ipsilateral Intracarotid Infusion of Sodium Chloride on the Composition of the (I. R. McDonald and Dr. D. A. Denton), 1035
Salivary Mucoid: Use of the Orcinol—Sulphuric Acid Reaction in the Positive Identification of certain Monosaccharides from a (Dr. M. Irwin and Dr. A. G. Leaver), 1126
Salt, Dr. G.: Elected a Fellow of the Royal Society, 559
Salt Absorption: Inhibition of, in Red Beet Root Tissue (J. E. Dale and Dr. J. F. Sutcliffe), 192
Salt Water: Fresh Water from (D. J. Neville-Jones), 270
Salt-Marsh Song Sparrows: Population Structure in (Richard F. Johnston), 1157
Salters' Company: Election of Salters' Fellows for 1956–57, and Salters' Scholarships, 1113
Salts: Purification of a Metal by Zone-refining one of its (J. L. Richards), 182
Salts (Cadmium): Effect of, on Testicular Tissue (J. Pařízek and Z. Záhor), 1036; (J. Pařízek), 1036
Salts (Insoluble): Adsorption of Trace Amounts of Cations on Anion Exchange Resins by the Formation of (R. H. James and G. A. Welch), 183
Salts (Metal): Termination of Chains in Vinyl Polymerization by (Dr. E. Collinson and Prof. F. S. Dainton), 1224
Salts (Quaternary Ammonium): Effect of the Anion on R_F Values of (Dr. Herbert Sheppard and Barbara Sachs D'Asara), 1089
Sammons, Dr. H. G., and others: Synthesis of Long-Chain Fats by Bacteria isolated from Human Fæces, 237
Sand Soil under *Pinus radiata*: Mycelial Aggregation of (R. H. Thornton, J. D. Cowie and D. C. McDonald), 231
Sanders, Dr. H. G. (Wishart, Dr. John, and): Principles and Practice of Field Experimentation, second edition, *review* by Dr. D. J. Finney, 680
Sanders, M.: Appointed assistant conservator of forests, Northern Rhodesia, 1207
Sanderson, A. R.: Awarded a Salters' Scholarship by the Salters' Company, 1113
Sanderson, Dr. Ann R., and others: Polymorphism and Parthenogenesis in a Ptinid Beetle, 847
Sanderson, Ivan T.: Living Mammals of the World, *review* by R. W. Hayman, 445
Sandris, G.: Chemistry of Oxygenated Heterocyclic Compounds, 1116
Sands (Foundry): Microscopy of Ceramics and Cements, including Glasses, Slags and (Herbert Insley and Prof. Van Derek Fréchette), *review* by Dr. W. Campbell Smith, 640
Sands (High-Silica): Adsorption of Carbon Dioxide at —79° C. on (H. D. Segrove), 987
Sandwich Courses: Development of (Ministry of Education and the British Association for Commercial and Industrial Education Conference on), 464
Sandwich Diploma Courses at Birmingham (Prof. M. R. Gavin), 781
Sardine: Spawning of the, at a Definite Time of Day (T. Gamulin and J. Hure), 193
Sargent, Prof. B. W.: Appointed a member of the National Research Council of Canada, 830
Sarma, Y. S. R. K.: Chromosome Numbers in Three Species of *Uronema*, 900
Satchell, J. E. (Dobson, Ronald M., and): *Eophila oculata* at Verulamium—a Roman Earthworm Population?, 796
Satellites: Skyhooks and, *review* by G. R. Noakes, 862
Sathe, Vanamala, and others: Spectrophotometric Method for the Estimation of Vitamin K_3, 276
Satten, R. A.: Spectroscopy, 738
Saucier, Walter J.: Principles of Meteorological Analysis, *review* by Dr. J. M. Stagg, 956
Saunders, Dr. Leonard: Title of reader in pharmaceutical chemistry in the University of London conferred on, 314
Saurashtra, India: Birds of, with Additional Notes on the Birds of Kutch and Gujerat (R. S. Dharmakumarsinhji), *review* by H. G. Alexander, 547
Savage, Prof. Leonard J.: The Foundations of Statistics, *review* by Prof. M. G. Kendall, 679
Savory, B. M.: Appointed assistant conservator of forests, Northern Rhodesia, 1207
Sawers, Dr. R. J. (Fantl, Dr. P., and): Anticoagulant Specificity and Physiologically Inactive Beta-Prothromboplastin, 1233
Sawyer, J. S.: Cloud Physics, 321
  The Free Atmosphere in the Vicinity of Fronts—Analysis of the Observations by the Meteorological Research Flight, 1950–52, 656
  Awarded the Hugh Robert Mill Medal and Prize for 1956 of the Royal Meteorological Society, 1014
Sawyer, Dr. W. H.: The Neurohypophysis, 1020
Saxl, Dr. H., and Graham, Dr. G. N.: Connective Tissue and its Changes with Age, 468
Saxon England: Sheep Farming in (Dr. W. G. Hoskins), 1071
Sayer, H. J.: A Photographic Method for the Study of Insect Migration, 226
Sayre, E. V., and others: Spectroscopy, 738
Scanning: X-Ray Mass Determination in Cells by (Bengt O. H. Rosengren), 1127
Scatter (Random), of Spheres: 'Pearl-String' Artefacts in a (J. H. Fessler), 439
Scattering (Twilight): Detection of Atmospheric Dust and Temperature Inversions by (Dr. E. K. Bigg), 77
Scattering Layers of Heteropods: Sonic (M. Blackburn), 374
Scent of Otariids (J. E. Hamilton), 900
Schanche, Mrs. Susan (Naess, Knut, and): Effect of Reserpine on Serotonin in Rabbit Serum, 1130
Schawlow, A. L. (Townes, Prof. C. H., and): Microwave Spectroscopy, *review* by Dr. D. M. S. Bagguley, 1099
Scheme (A New), of Qualitative Inorganic Analysis, *review* by Prof. J. R. Partington, 498
Schistosoma haematobium: *Bulinus (Pyrgophysa) forskalii* (Ehrenberg) as a Vector of (Dr. C. A. Wright), 43
Schistosomiasis (Avian): Nasal Trichobilharziasis, a New (Dr. A. Fain), 389
Schizaeaceae of the South of England in Early Tertiary Times (Marjorie E. J. Chandler), 463
Schmid, H.: Chemistry of Oxygenated Heterocyclic Compounds, 1117
Schmidt, Prof. E.: Elected a *correspondant* for the Geometry Section of the Paris Academy of Sciences, 918
Schmidt, Dr. K. P.: Retirement as chief curator of the Department of Zoology in the Chicago Natural History Museum, 507; work of, 507
  Elected a Member of the National Academy of Sciences, Washington, 926
Schmidt, Prof. O. Th.: Vegetable Tannins, 880
Schmitt, Prof. Francis O.: Chromosomes, Genes and Macromolecular Systems, 503
Schneiderman, Dr. Howard A.: Spiracular Control of Discontinuous Respiration in Insects, 1169
Scholarship (Ciba Research), in the techniques of Organic Chemistry (University of Birmingham), 693
Scholarship Trust: Frederick D. Edwards, 1204
Scholarships (Ministry of Agriculture, Fisheries and Food), 364
Scholarships: Transfer (Imperial Chemical Industries, Ltd.), 606
Scholarships in Agricultural Economics, Husbandry, Statistics and Agricultural and Dairy Engineering: Postgraduate (Ministry of Agriculture, Fisheries and Food, and the Department of Agriculture for Scotland), 415
Scholarships in Agricultural Engineering (Institution of British Agricultural Engineers), 511
Scholarships to British workers in Medical Science (Medical Research Council, on behalf of the Centre National de la Recherche Scientifique), 415
Scholarships for the Study of Chemistry or Allied Technical Subject (Shell Austria, A G.), 779
Scholarships in Naval Architecture (Institution of Naval Architects), 263
Scholarships and Bursaries (Fellowships), in Dentistry, Biology and the Social Sciences (Nuffield Foundation), 361
Scholarships or Fellowships for Research on Diseases of the Blood, with special reference to Leukæmia. Grants, (Lady Tata Memorial Fund), 415, 1208
Scholes, Dr. G., and others: Effect of Solute Concentration in the Irradiation of Aqueous Solutions by Ionizing Radiations, 883
Schonfeld, Dr. T. (Broda, Dr. E., and): Verwendung der Radioaktivitat in der Mikrochemie; Radiochemische Methoden der Mikrochemie, *review* by Prof F. A. Paneth, 953
School in Programme Design for Automatic Digital Computing Machines: Summer (Mathematical Laboratory of the University of Cambridge), 922
School in Theoretical Chemistry: Summer (University of Oxford), 562
School on Welding: Summer (British Welding Research Association), 922
School Teaching in Australia: New Methods of, *review*, 250
School and University: The Teaching of Chemical Principles in (British Association for the Advancement of Science, Sections B (Chemistry) and L (Education), Discussion on), 72
Schools: Industrial Fund for the Advancement of Scientific Education in, 733
Schramm, Prof. G. (Gierer, Dr. A., and): Infectivity of Ribonucleic Acid from Tobacco Mosaic Virus, 702
Schreiber, G. (edited by): Proceedings of a Symposium on Cell Secretion, 831
Schreiner, Prof. G. D. L., and Jamieson, Dr. R. T.: Production and Utilization of Electromagnetically Enriched Isotopes, 160

Schulman, James H.: Colour Centres in Metaphosphate Glass, 287
Schütte, Dr. Karl (prepared by): Index of Mathematical Tables from all Branches of Sciences, *review* by J. H. Pearce, 767
Schuur, G.: Some Aspects of the Crystallization of High Polyners, *review* by Prof. H. W. Melville, 640
Schwabe, W. W.: A Flowering Inhibitor in *Kalanchoe*, 692
Schwan, Herman P., and others: A Dielectric Study of the Low-Conductance Surface Membrane in *E. coli*, 134
Schwartz, Dr. Morris S. (Stanton, Dr. Alfred H., and): The Mental Hospital, *review* by Dr. G. M. Carstairs, 250
Schwarzschild, Prof. M.: Elected a Member of the National Academy of Sciences, Washington, 926
Schwertz, F. A. (Wolken, J. J., and): Molecular Weight of Algal Chloroplastin, 136
Schwinck, Ilse (Hadorn, Prof. Ernst, and): A Mutant of *Drosophila* without *Iso*xanthopterine which is Non-Autonomous for the Red Eye Pigments, 940
Science: Agricola's Position in (President Herbert C. Hoover and Mrs. Hoover), 166
  The Art of (Prof. L. C. Beadle), 610
  Documentation of, 466
  Essays on, *review* by Dr. W. L. Sumner, 1097
  An Illustrated History of (Dr. F. Sherwood Taylor), *review* by Dr. F. J. North, 107

  Impact of, on Religion, *review* by the Very Rev. Dr. W. R. Matthews, 638
  The Influence of, on People (Dr. Warren Weaver), 694
  Interpreter of, *review* by R. Brightman, 955
  Kant's Metaphysics and Theory of (Prof. Gottfried Martin), translated from the German by P. G. Lucas, *review* by Prof. L. J. Russell, 152
  The Metaphysics of (Dr. C. K. Grant), 369, 998 , (Prof. Reginald O. Kapp), 997
  Photographic, 360
  Politics and (William Esslinger), 293
  The Presentation of, to the Public (Institute of Biology, the Royal Institute of Chemistry and the Institute of Physics Symposium on), 415, 1066
  Sonics—Techniques for the Use of Sound and Ultrasound in Engineering and (Theodor F. Hueter and Prof. Richard H. Bolt), *review* by Dr. H. D. Parbrook, 4
  What is (edited by James R. Newman), *review* by Dr. W. L. Sumner, 1097
Science in India : History of, 967
Science in the United States during 1954, 76
Science can Provide as Good an Education as the Humanities (Fine Chemicals Group of the Society of Chemical Industry Debate on the Motion that), 562, 960
Science makes Sense (Ritchie Calder), *review* by R. Brightman, 955
Science for Peace . Annual General Meeting, 415
  Public Conference on the Atomic Age—Perspectives and Problems, 415
Science (Agricultural) : Third Easter Symposium in (University of Nottingham), 215
Science (Behavioural) . Psychosomatic Research and (Dr. Clifford Allen), 974
Science (Marine), in the Pacific Area (Dr. G. E. R. Deacon), 353
Science (Marine or Freshwater) : Research in (Development Commission Grants for), 736
Science (Modern), and Christian Beliefs (Dr. Arthur F. Smethurst), *review* by the Very Rev. Dr. W R. Matthews, 638
Science (Nuclear) : Recent Advances in, *review* by Dr. E. Bretscher, 54
Science (Polish) : Studies and Materials from the History of (Polish Academy of Science), Vol. 2, 652
Science (Soil), in India (Dr S. P. Raychaudhuri), 1063
Science (Wood), Institute of : Formation of an, 690
Science and Defence in Great Britain, 18
Science and Education (Sir Edward Salisbury), 170
Science and Engineering Use of Logarithmic Notation in (Prof. S. Devons), 373
Science and Engineering Graduates in British Industry : Shortage of (Federation of British Industries), 312
Science and Industry Methods, Materials and Processes involved in the Uses of High Temperatures in (Stanford Research Institute and the University of California Symposium on), 693
Science and the Nation (Sir Edward Appleton), 364
Science and Technique of Photography (Scientific and Technical Group of the Royal Photographic Society Conference on), 736
Science and Technology in Defence, 635
Science and Technology in Western Germany · A Brief Review of (K. H. Lauder), 316
Science, Technology and Man-power, 51
Science Abstracts . New Forms of, 829
Science Babel (Dr. Knut Faegri), 343
Science Council of Japan (organized by the), with the collaboration of Kyoto University and the Physical Society of Japan : Proceedings of the International Conference on Theoretical Physics, Kyoto and Tokyo, September 1953, *review*, 1053
Science House, Pakistan (Sir George Allen), 1201
Science Masters' Association : Annual Meeting in London, 170
  Presidential Address (Sir Edward Salisbury on Science and Education), 170
  Report of a Sub-Committee on Laboratory Technicians, 270
  The Science Masters' Book, Series 3, Part 2, Chemistry (arranged and edited by G. Fowles, with the assistance of E. H. Coulson and Charles Holt), *review* by J. C. Stredder, 957
  Annual Report for 1955, 1159
Science Masters' Book Series 3, Part 2, Chemistry (arranged and edited by G. Fowles, with the assistance of E. H. Coulson and Charles Holt), *review* by J C. Stredder, 957
Science Museum, London . Classified Lists of Historical Events, I, Mechanical and Electrical Engineering (compiled by G. F. Westcott), 830
  Perkin Exhibition, 1009
  Appointment of Dr. T. C. S. Morrison-Scott as director, 1061
Sciences · Index of Mathematical Tables from all Branches of (prepared by Dr. Karl Schutte), *review* by J. H. Pearce, 767
  The Balance of Arts and, in Education, 1095
Sciences (Social) · Fellowships in (Rockefeller Foundation Awards), 977
  Fellowships, Scholarships and Bursaries in Dentistry, Biology and the (Nuffield Foundation), 361
Scientific Ability, its Detection and Development (British Social Biology Council Conference on), 464, 823
Scientific Centenaries in 1956 (Joan M. Eyles), 7
Scientific Civil Service : Promotion of Individual Research Workers, 218
Scientific Committee, Parliamentary and · Annual Report for 1955, 691
Scientific Development . Copyright and, 717
Scientific Education in Schools : Industrial Fund for the Advancement of, 733
Scientific Film Association : Report of the Proceedings of the Conference on the Use of the Film in the Improvement of Human Relations in Industry, 214
Scientific Film Association (Industrial Committee) : Course on First Steps in Industrial Film Making, 364
Scientific Film Review, 1111
Scientific Humanism (S. J. Tester), 1212
Scientific Instrument Manufacturers' Association : Exhibition of Scientific Instruments, 312, 968
Scientific Instrument Manufacturers' Association (Electronics Section) : Exhibition on Atoms, Electrons and Industry, 736
Scientific Instrument Research Association, British : Retirement of A. J. Philpot from the directorship, 827
  Appointment of Dr. J. Thomson as director, 827
Scientific Instruments . Exhibition of (Scientific Instrument Manufacturers' Association), 312, 968
Scientific Instruments and Apparatus : Annual Exhibition of (Physical Society), 653
  Handbook of (Physical Society), 874
Scientific Language : Scientific Papers and, 1
Scientific Papers and Scientific Language, 1
Scientific Policy, Advisory Council on (Committee on Scientific Manpower) : Report on the Recruitment of Scientists and Engineers by the Engineering Industry, 51
Scientific Problems of Humid Tropical Regions, 463
Scientific Publications (World List of) : Fourth list of amendments to the third edition (Society of Chemical Industry), 1159
Scientific Radio Union, International : Proceedings of the fourth meeting of the Mixed Commission on the Ionosphere, 118
  Report of Commission 4 on Radio Noise of Terrestrial Origin, 652
Scientific Research : Cinematography in, *review* by Prof. G. E. H. Foxon, 298
Scientific Research in British Universities, 1954–55 (Department of Scientific and Industrial Research), 828
Scientific Research in Central Africa, Institute for : Report for 1953, 971
Scientific Societies, South-Eastern Union of · Sixty-first Congress, 876
Scientific Unions, International Council of : Work of the Abstracting Board (Prof. G. A. Boutry), 466
Scientific View of the Universe in the Physics of the Seventeenth and Eighteenth Centuries · Evolution of a (B. G. Kuznetsov), (in Russian), *review* by Dr R. Eisenschitz, 1194
Scientific Work of Benjamin Franklin (Prof. E. N. da C. Andrade), 60
Scientific Workers in Great Britain : Shortage of, 967
Scientific Workers, Association of, and the Labour Research Department : Pamphlet on the Peaceful Uses of Atomic Energy, 69
Scientific Workers and Technologists in Britain : Statistics of, 828
Scientific and Industrial Research, Central Laboratories for (Hyderabad) : Annual Report for 1954, 567
  Formally taken over by the Council of Scientific and Industrial Research, Government of India, and will be known as the Regional Research Laboratory, Hyderabad, 922
Scientific and Industrial Research, Council of (Atmospheric Research Committee), and the India Meteorological Department : Proceedings of the Symposium on Artificial Rain-making in India, 362
Scientific and Industrial Research, Department of : Retirement of Sir Ben Lockspeiser as secretary to the Committee of the Privy Council for Scientific and Industrial Research, 260
  Appointment of Prof. H. W. Melville as secretary, 260
  Appointment of Prof C B. B M. Sutherland as director of the National Physical Laboratory, 260
  A Brief Review of Science and Technology in Western Germany (K. H. Lauder), 316
  First reading of the Research Bill in the House of Lords, 606
  Annual Report for the Year 1954–55, 768, 821
  Third reading of the Research Bill, 805
  Report of a Committee of Enquiry, 805
  Scientific Research in British Universities 1954–55, 828
  Annual Report for 1954 of the Forest Products Research Laboratory, 875
  Third International Congress on High-speed Photography, 876
  Open Day at the National Physical Laboratory, 877 ; (E. I. Brimelow), 1151
  Appointment of Sir Harry Jephcott as chairman of the Advisory Council, 922
  Final Report of the Road Research Laboratory on Direction Indicators for Motor-Vehicles, 016
  Automation, a Report on the Technical Trends and their Impact on Management and Labour, 1141
Scientific and Industrial Research, South African Council for : Ninth Annual Report (1953–54), 512
Scientific and Industrial Research Organization, Commonwealth : Appointment of Dr. G. F. Humphrey as chief of the Division of Fisheries and Oceanography, 461
  New members of the Advisory Council, 734
  Bulletin No. 258, The Beef-Cattle Industry of Australia (W. A. Beattie), 1063
Scientific and Professional Manpower : Proceedings of a Conference at Columbia University on the Utilization of (National Manpower Council), 675
Scientific and Technical Books Recent, Supp. viii, January 28 ; Supp. viii, February 25 ; Supp. vi, March 31 , Supp. viii, April 28 , Supp. viii, May 26 ; Supp. viii, June 30
Scientific and Technical Societies of the United States and Canada (National Academy of Sciences—National Research Council), sixth edition, *review*, 549
Scientist . The Dilemma of the (Dr. J. Bronowski), 734
Scientist in Colonial America : Lewis Evans (1700–56), a (Prof. George W. White), 1055
Scientist and Society, 734
Scientists for Colonial Research, 734
Scientists and Engineers . Report on the Recruitment of, by the Engineering Industry (Committee on Scientific Manpower of the Advisory Council on Scientific Policy), 51
  United States National Committee for the Development of, 734
Scientists and Technologists in Britain : Supply of, 873
Scientists, Technologists and Technicians Technical Education—Shortage of (John Wellens), 967
Sclerotinia fructigena and *S. laxa* : Pathogenicity of *Botrytis cinerea*; (J. S. Cole), 738
Scolytid Beetle : Flight-muscle Changes during Adult Life in a (Dr. John A. Chapman), 1183
Scorer, R. S. : Movements in the Ionosphere, 308
Scorer, R. S. (Ludlam, F. H , and) · Further Outlook, *review* by James Paton, 641

Scortecci, Prof A. : Documentation of Applied Chemistry, 169
Scotland : Agricultural Research in, 607
  An Arctic Lichen, *Siphula ceratites*, in (D. N. McVean), 797
  Freshwater Biology in (Scottish Branch of the Institute of Biology Symposium on), 1115
  Periodicity of the Laminariaceae around (F. T Walker), 1246
Scotland and the north of England : Grants for Geological Research in (Clough Memorial Research Fund of the Edinburgh Geological Society), 415
Scott, Dr. Jesse F (Munck, Allan U, and) : Ultra-Violet Absorption of Oxygen in Organic Solvents, 587
Scott, N. D., and others : Oxidation as a Source of 'Anomalies' in Amylose, 889
Scott, Thomas G. : An Evaluation of the Red Fox, 1073
Scott, W. H. : Industrial Democracy, a Revaluation, 515
Scott, W. N. : Appointed senior agricultural officer, grade A, Federation of Malaya, 736
Scottish Field Studies Association : Annual Report for 1955, 692
Scottish Home Department (Home Office and) : Manual of Civil Defence, Vol. 1, Pamphlet No. 1, Nuclear Weapons, 262
Scottish Marine Biological Association : Retirement of E. Ford from the secretaryship, 605
  Appointment of Dr. C. H. Mortimer as secretary, 605
Scottish Meteorological Society : Centenary of the Former, 371
Scripps Institution of Oceanography, and others : Symposium on Perspectives in Marine Biology, 70, 1212
Sea : Animal Sounds in the (Marie Poland Fish), 1117
Sea Bass : A Large, 413
Sea Surface : Statistics and Aerodynamics of the (Royal Meteorological Society Symposia on), 62
Sea Water Cations across the Ectoderm of *Fundulus heteroclitus* : Factors influencing the Transport of (D. R. Shanklin), 431
Sea Waters : The Chemistry and Fertility of (Dr. H. W. Harvey), *review* by Michael Graham, 549
Seaman, Dr D. E., and others : Phosphorylation as a Possible Factor in the Pasteur Effect in Plants, 333
Search for Point Source of Cosmic Rays (Y. Sekido, S. Yoshida and Y. Kamiya), 35
Sears, Francis Weston, and Zemansky, Mark W. : University Physics, second edition, *review*, 957
Seasonal Sweating (P. C. B MacKinnon and Dr. I. L. MacKinnon), 799
Seasonal Variation in the Egg Production of Hens : Control of (J C. D. Hutchinson), 795
Sebilleau, Dr. F., and Bibring, Dr H. : Mechanism of Phase Transformations in Metals, 420
Second Ecdysis of Nematode Larvæ parasitic in the Horse : Effect of a Coli-form Organism (*Escherichia*) on the (D. Poynter), 481
Secondary Wall of the Protoxylem of *Cucurbita* : Electron Microscopic Observations on the (C. E. L. Hepton, Prof. R. D. Preston and G. W Ripley), 660
Secretion in the Sublingual Gland of the Cat : Secretory Potentials and (Dr. Anders Lundberg), 1080
Secretory Potentials and Secretion in the Sublingual Gland of the Cat (Dr. Anders Lundberg), 1080
Sectioning of Soil (Shirley Hepple and Prof. Alan Burges), 1186
Seddon, A. E. : Non-Destructive Testing of Materials and Structures, 468
Sedimentation and Electrophoresis of Complex Systems in Rapid Reversible Equilibrium : Boundary Problems in the (Dr. G. A. Gilbert and R. C. Ll. Jenkins), 853
Sediments (Deep-Sea) : Cosmic Spherules in (Kurt Fredriksson), 32
'Seebeck Effect' in a Purely Ionic System (H. J.-V. Tyrrell, D. A. Taylor and C. M. Williams), 668
Seed Production : Fruit and (Sir Edward Salisbury), 64
Seed-borne Parasites in Seeds : Detection of (Prof A. E. Muskett and Dr. J. P. Malone), 465
Seedlings : Relationship between Length of Day and Geotropic Response in (E. Dorothy Brain), 323
Seedlings (Lettuce) : Growth of (Winifred M. Dullforce), 1244
Seeds : Detection of Seed-borne Parasites in (Prof. A. E. Muskett and Dr. J. P. Malone), 465
Seeds of *Ricinus communis* : Biosynthesis of Fatty Acids by (N. Coppens), 279
Seeds (Small) : A Simple Potometer for Measuring Rate of Water Uptake by (Dr. Shimon Klein), 707
Seeger, Dr A : Mechanism of Phase Transformations in Metals, 419
Seeing America's Wildlife in our National Refuges (Devereux Butcher), *review* by E M. Nicholson, 765
Segar, A. M : Appointed a Rutherford Scholar by the Royal Society, 1113
Segre, Prof. A. : Symposium on Thioctic Acid, 75
Segre, Prof. E. : Enrico Fermi and his Contributions to Physics, 781
Segrè, Prof. E, and others : Antiprotons, 11
Segrove, H D. : Adsorption of Carbon Dioxide at — 79° C. on High-Silica Sands, 987
Seiler, Dr H. E., and others : Leptospirosis in Piggery Workers, 1042
Seismic Prospecting : Improvements in (Royal Astronomical Society Geophysical Discussion on), 1209
Seismic Shooting Methods : Determination of the Thickness of Ice Shelves by (G. de Q. Robin), 584
Seismological Commission, European : Meetings in Vienna (Ernest Tillotson), 1021
Seismology (Prof. K. E. Bullen), *review* by Ernest Tillotson, 57
Seitz, Prof F : Enrico Fermi and his Contributions to Physics, 781
Sekido, Y., and others : Search for Point Source of Cosmic Rays, 35
Selection for Heterozygotes during Inbreeding (J. B. Thompson and H. Rees), 385
Selective Medium for the Isolation of Basidiomycetes (P. Russell), 1038
Selectivity of Enzyme-activated Nitrogen Mustards (P. Hebborn and Prof. J. F Danielli), 25
Self-inflation in a Gobioid Fish (Prof. J. L B Smith), 714
Self-Reversal of Thermoremanent Magnetism : Production of, by Heat Treatment of Ferromagnetic Minerals (Prof. T. Nagata and S. Uyeda), 179
Selfing in Lucerne Strains : Tripping, Crossing and (A. Zaleski), 334
Seligman, Gerald ; Presented with an inscribed silver tray by the British Glaciological Society, 414
  Elected president for 1956 of the British Glaciological Society, 414
Semen (Aspermic Human) : Zinc in (C. A. Mawson and M. Isabel Fischer), 190
Semiconductors (Low Temperature and Solid State Physics Group of the Division of Pure Physics, National Research Council, Ottawa, Symposium on), 833
Semi-conductors : Thermionic Constants of (Sir K S. Krishnan and Dr. S. C. Jain), 285
Semi-Micro Organic Preparations (Dr. J. H. Wilkinson), *review* by G. Fowles, 957
Semi- and Non-Crystalline Materials (X-Ray Analysis Group of the Institute of Physics Conference on), 121, *erratum*, 314
Sen, J. : A New Type of Male Fructification referable to *Glossopteris*, 337
Sense : Science makes (Ritchie Calder), *review* by R. Brightman, 955
Sensitivity : Bacterial Variation to—an Example of Individuality in Micro-organisms (Dr. W. Howard Hughes), 1132
Sensitivity of the Mouse Testis to the Mutagenic Action of X-Rays (Dr. C. Auerbach and Dr. B. M. Slizynski), 376, 934 ; (Dr A. J. Bateman), 934
Separation of Epidermis from Dermis by Filtrates of *Trichophyton mentagrophytes* (Dr. C. N. D. Cruickshank and M. D. Trotter), 1085
Separation of Hydrocarbon Isomers by Thermal Diffusion (Dr. C. J. Danby, J. D. Lambert and C. M Mitchell), 1225
Separation of the Isomers of Benzene Hexachloride by Reversed-Phase Paper-Partition Chromatography (R. G. Bridges, A. Harrison and F P. W Winteringham), 86
Separation of Unstable Oxidation Intermediates of Cysteine (Dr. G. Toennies and J J. Kolb), 281
Septate Fibres in Angiosperms and their Length (K. A. Chowdhury, S. K. Purkayastha, S. S. Ghosh and J S. Sond), 1243
Sera (Antiglobulin) : Preparation of (F Milgrom, T. Luszczynski and S Dubiski), 329
Series (New), of Ganglion-blocking Agents (Dr. D W. Adamson, J. W. Billinghurst, A. F. Green and Dr. S. Locket), 523
Serotonin in Rabbit Serum : Effect of Reserpine on (Knut Naess and Mrs. Susan Schanche), 1130
Serpinsky, Dr. V. V. : Documentation of Applied Chemistry, 169
Serum : Di- and Mono-Taurobilirubin similar to a Directly Reacting Form of Bilirubin in (Dr. M. Jirsa, B. Večerek and M. Ledvina), 895
  5-Hydroxytryptamine in (D. F. Sharman and Frank M. Sullivan), 332
Serum (Rabbit) : Effect of Reserpine on Serotonin in (Knut Naess and Mrs. Susan Schanche), 1130
Serum Agar Plates : Production of Opacity on, by some Strains of *Staphylococcus aureus* (A. J H. Tomlinson and M. T. Parker), 895
Serum Gamma-Globulin : Effect of Cortisone on the (R S. Snell and Prof. T. Nicol), 578
Serum Magnesium Changes in Hibernation (Marvin L. Riedesel and G. Edgar Folk, jun.), 668
Serum Proteins : Two-Dimensional Electrophoresis of (Dr. O. Smithies and M. D. Poulik), 1033
Serum and Urine : A Modified Method of Two-Dimensional Zone Electrophoresis applied to Mucoproteins in (R. L. Markham), 125
Serventy, D. L (Marshall, Dr. A. J., and) : Moult Adaptation in relation to Long-distance Migration in Petrels, 943
Service, M. W. : Appointed entomologist, Malaria Service, Federation of Nigeria, 70
Services' Text-Book of Radio, *review* by C. R. Stoner, 1192
Servomechanism Analysis (George J. Thaler and Robert G. Brown), *review* by R. Neumann, 766
Servo-Mechanisms and Control Systems, *review* by Dr. Colin Cherry, 351
Seshadri, T. R. : Chemistry of Oxygenated Heterocyclic Compounds, 1116
Seventeenth and Eighteenth Centuries : Evolution of a Scientific View of the Universe in the Physics of the (B. G. Kuznetsov), (in Russian), *review* by Dr. R. Eisenschitz, 1194
Sewell, C. Elizabeth, and others : Reticulocyte Enzymes and Protein Synthesis, 190
Sewell, Geoffrey W. F. : A Slide-trap Method for the Isolation of Soil Fungi, 708
Sex in Early Human Embryos : Determination of (Dr. T. W. Glenister), 1135
Sex Determination : Antenatal (Dr. Fritz Fuchs and Dr Povl Riis), 330
Sex and Morality (Prof Abram Kardiner), *review* by Dr Clifford Allen, 54
Sexual Morality, *review* by Dr. Clifford Allen, 54
Shah, K. B. (Vaidya, Prof. P. C., and) : Influence of Expanding Space on the Gravitational Fields surrounding Individual Stars, 802
Shah, Dr. M. K : Reciprocal Egg Transplantations to study the Embryo-Uterine Relationship in Heat-induced Failure of Pregnancy in Rabbits, 1134
Shanklin, D. R. : Factors influencing the Transport of Sea Water Cations across the Ectoderm of *Fundulus heteroclitus*, 431
Shannon, Dr. Claude E. : Appointed visiting professor of electrical communications at the Massachusetts Institute of Technology, 314
  Elected a Member of the National Academy of Sciences, Washington, 926
Shape : Effect of, on the Static and Dynamic Stress-Strain Relationship of Bonded Rubber in Compression (A. R Payne), 1174
Sharabash, M Mokhtar (Taha, Dr. E. D. M., and) : Utilization of Xanthin by Mould Fungi, 622
Sharma, Archana (*nee* Mookerjea), (Sharma, Arun Kumar, and) : Fixity in Chromosome Number of Plants, 335
Sharma, Arun Kumar, and Sharma, Archana (*nee* Mookerjea) : Fixity in Chromosome Number of Plants, 335
Sharma, J. : Semi-conductors, 833
Sharman, D. F., and Sullivan, Frank M. : 5-Hydroxytryptamine in Serum, 332
Sharman, G A. M., and others : Muscular Dystrophy of Beef Cattle and Unsaturated Fats, 792, *erratum*, 1208
Sharman, G. B. : Chromosomes of the Common Shrew, 941
Shattering of Large Drops (R. H. Magarvey and B. W. Taylor), 745
Shaw, Dr. C H : Low-Temperature Crystallography, 1068
Shaw, D. F. : Awarded a Commonwealth Fund General Fellowship, 736

Shaw (Napier) Memorial Prize of the Royal Meteorological Society awarded to Dr. Norman A. Phillips, 1203
Shaw, Prof. R. R. : Documentation of Applied Chemistry, 168
Shea, Richard F. · Transistor Audio Amplifiers, *review* by D. D. Jones, 864
Shearer, Dr. H M. M. (Robertson, Prof. J. Monteath, and) : Structure of Azulene, 885
Sheep : Prevention of Toxæmia of Late Pregnancy in (H. B. Parry), 288
  Proposed Terminology for Wool Follicles in (Dr. Margaret H. Hardy and A G Lyne), 705
  Response of the, to Sublethal Doses of Fluoroacetate (I. G. Jarrett and Angus Packham), 580
Sheep (Fœtal) : Nuclear and Cytoplasmic Volumes in the Hepatic Cells of the (D. A. T. Dick), 236
Sheep (Sodium-depleted) Delayed Effect of Ipsilateral Intracarotid Infusion of Sodium Chloride on the Composition of the Parotid Saliva of (I. R. McDonald and Dr D. A Denton), 1035
Sheep Farming in Saxon England (Dr. W. G. Hoskins), 1071
Sheldon; H., and others · Histochemical Techniques for Electron Microscopy—Alkaline Phosphatase, 382
Shell Austria, A.G. . Scholarships for the study of chemistry or allied technical subject, 779
Shell Composition in Barnacles : Corrosion and (H. Barnes), 290
Shenstone, F. S , and Vickery, J. R. A Biologically Active Fatty-acid in Malvaceae, 94
Shephard, Dr. R. J. : Awarded a Junior Beit Memorial Fellowship for Medical Research, 966
Shepherd, K (Simmonds, N. W., and) Taxonomy and Origins of Cultivated Bananas, 1111
Sheppard, Dr. Herbert, and D'Asaro, Barbara Sachs · Effect of the Anion on *RF* Values of Quaternary Ammonium Salts, 1089
Sheppard, Prof P. A. : Turbulence in the Atmosphere, 14
Sheppard, R C. : Elected a Salters' Fellow for 1956–57 by the Salters' Company, 1113
Sheridan, K. V , and others : Absorption of 3 5-m. Radiation in the Optical Emission Nebula, *NGC* 6357, 178
Shetland : Birds and Mammals of (L. S. V. Venables and U. M. Venables), *review* by Frances Pitt, 451
Shielding Problems : Swimming-Pool Reactor at Harwell for the Study of, 777
Shields, Howard, and others : Microwave Detection of Metallic Ions and Organic Radicals in Plant Materials, 984
Shimokoriyma, M. : Chemistry of Oxygenated Heterocyclic Compounds, 1116
Shimura, Kensuke, and others : Aminomalonic Acid Decarboxylase—a New Enzyme, 935
Shock (Anaphylactic), and Compound 48/80 : Effects of, on the Mast Cells of the Guinea Pig Lung (Dr. Ivan Mota and Itamar Vugman), 427
Shock Hazard with certain Multigap Spark Circuits · Absence of (D. A. Sinclair), 1175
Shock Intersections (Multiple) Enhanced Initiating Effect of (Dr. C H. Winning), 33
Shock Wave in Muscular Tissue · Propagation of an Air-transmitted (Carl-Johan Clemedson, Arne Jonsson and Hjalmar Pettersson), 380
Shock Waves : Determination of Arc Temperatures using (D. Whittaker and Dr. H Edels), 484
Sholl, D. A · Title of reader in anatomy in the University of London conferred on, 215
Shooter, Dr K. V., and Butler, Prof. J. A. V. : Fractionation of Deoxyribonucleic Acid by Physical Procedures, 1033
Shoppee, Prof. C. W : Elected a Fellow of the Royal Society, 559
Short, M A., and others . Electroluminescence in Disordered Zinc Sulphide, 240
Short Supply Books in (C. Kirke Swann), 612
Short-circuited Frog Skin (Isolated,) : Oxygen Consumption and Active Transport of Sodium in the (Dr. K Zerahn), 937
Short-styled Form in the 'Genus' *Oxalis* Two Modes of Inheritance of the (Mrs V. C Fyfe), 942
Shortage of Science and Engineering Graduates in British Industry (Federation of British Industries), 312
Shortage of Scientific Workers in Great Britain, 967
Shortage of Scientists, Technologists and Technicians Technical Education —(John Wellens), 967
Shorter, D. E. L., and Harwood, H D. : Design of a Ribbon Type Pressure-Gradient Microphone for Broadcast Transmission, 519
Shotton, Dr. E : Appointed to the University of London chair of pharmaceutics in the School of Pharmacy, 736
Shotton, Prof. F. W : Elected a Fellow of the Royal Society, 559
Shrew (Common) : Chromosomes of the (G B. Sharman), 941
Shulman, A · A Possible Mode of Action of 2 4-Diamino-5-phenyl-thiazole Hydrochloride (Daptazole or Amiphenazole), 703
Sialoadenectomy Effect of, on Thyroid Activity (Dr. Arthur W. Wase and Yu Sheng Louise Feng), 624
Siddall, R. G : Appointed lecturer in fuel technology and chemical engineering at the University of Sheffield, 17
Siegel, Prof. C. L. . Elected a *correspondant* for the Geometry Section of the Paris Academy of Sciences, 1062
Siewing, Rolf (Gerlach, Sebastian A., and) : A Bathynellid from the New World, 289
Signals Low Audio-frequency Electromagnetic, of Natural Origin (R. E. Holzer and O. E. Deal), 536
Sikorski, Dr. J. : Electron Microscopy of Fibres, 318
Sikorski, Dr. J. (Meggy, Dr A. B , and) : Dimorphism of Polyglycine, 326
Sikorski, Dr. J (Woods, H. J., and) Fibre Microscopy, 516
Silage : Microbiology of (Kathleen J Anderson), 96
Silcock, Miss J M. : Mechanism of Phase Transformations in Metals, 419
Silica · Ion-Exchange Preparation of Low-Silica Hydroxide Solutions for Colorimetric Determinations of Total (Sallie Fisher and Robert Kunin), 1125
Silica (High-) Sands : Adsorption of Carbon Dioxide at —79° C. on (H. D Segrove), 987
Silica (Low-) Hydroxide Solutions · Ion-Exchange Preparation of, for Colorimetric Determinations of Total Silica (Sallie Fisher and Robert Kunin), 1125
Silk : Utilization of the Carboxyl Carbon of L-Phenylalanine for the Synthesis of the Amino-acids of, by *Bombyx mori* (S. Bricteux-Grégoire, W. G. Verly and Prof. M. Florkin), 1237
Silkworm Larva (*Bombyx mori*) : Conversion of Phenylalanine into Tyrosine in the (T. Fukuda), 429
Silliman Memorial Lectures (Hans Pettersson), *review* by Dr. J. D. H. Wiseman, 450
Silver Medal of the Royal Aeronautical Society awarded to Dr. E. S. Moult, 919
Sim, D. : Appointed senior assistant conservator of forests, Gold Coast, 1112
Simensen, Dr. Morten : Awarded a grant from the Lady Tata Memorial Fund, for research on leukæmia and allied diseases, 1208
Simmond, J M. : Appointed senior statistician, Gold Coast, 1112
Simmonds, N. W., and Shepherd, K. : Taxonomy and Origins of Cultivated Bananas, 1111
Simms Gold Medal of the Royal Aeronautical Society awarded to K. V. Diprose, 919
Simon, Sir Francis : Low-Temperature Crystallography, 1067
  Appointed to the Lee chair of experimental philosophy in the University of Oxford, 1155 ; work of, 1155
Simon of Wythenshawe, Lord : The Age-Group Bulge and its Possible Effect on University Policy, 116
  Future Numbers of University Students—the Desperate Need for Technologists, 1214
Simonsen, M (Ryle, Margaret, and) · Attempts at Hybridization of Chickens and Turkeys which are Tolerant of each others' Antigens, 437
Simple Method of Assessing the Moisture exuded through the Skin of Cattle (R. M Mabon), 284
Simple Method of Studying Winds in the Ionosphere by using Continuous-Wave Radio (Dr. B Ramachandra Rao and D. Satyanarayana Murty), 1222
Simple Potometer for Measuring Rate of Water Uptake by Small Seeds (Dr. Shimon Klein), 707
Simple Spinning Joint for a Rotary Film Evaporator (K. L. Bocock and Dr A. Gilbert), 439
Simpson, E. H. Awarded a Commonwealth Fund Home Civil Service Fellowship, 736
Simpson, H. J Appointed senior agricultural officer, grade A, Federation of Malaya, 736
Simpson, J. H. : Semiconductors, 833
Simpson, Dr. Melvin V (Light, Dr Albert, and) : Paper Chromatography of Insulin, 225
Sims, R. W. . Morphology of the Head of the Hawfinch, 463
Simultaneous Recording of Inspired Oxygen Concentration and Peripheral Tissue Oxygenation (Dr R. H. Kay and Dr. R V Coxon), 45
Sinclair, D. A. : Absence of Shock Hazard with certain Multigap Spark Circuits, 1175
Sinclair, Dr. D. C. . Appointed to the chair of anatomy in the Medical School of the University of Western Australia, Perth, 1065
Singer, Dr. A R. E. Appointed to the newly created chair of metallurgy at University College, Swansea, 411 ; work of, 411
Singer, Dr. Charles : A Short History of Medicine, *review*, 909
Singh, Dr. B N., and others : Occurrence and Nature of an Amœba Excystment Factor produced by *Aerobacter* sp., 621
Singh, R. K., and Wood, R. K. S. . Production and Properties of the Pectic Enzymes secreted by *Fusarium moniliforme*, 738
Singh, R. P. : Semiconductors, 833
Single and Fractionated Doses of X-Rays : Effects of, on Mouse Embryos (Dr. Robert Auerbach), 574
Sinton, Brigadier J. A. : Awarded the Manson Medal for 1956 of the Royal Society of Tropical Medicine and Hygiene, 562
  Obituary by Sir Gordon Covell, 826
Siphula ceratites in Scotland : An Arctic Lichen (D. N. McVean), 797
Siple, Dr. Paul Meteorology and Geographical Features of the Antarctic, 508
Sirlin, J. L. (Edwards. R. G., and) : Labelled Pronuclei in Mouse Eggs fertilized with Labelled Sperm, 429
Sironval, C. (Bonnier, Ch., and) · Influence of Day-length on Nodule Formation in *Soja hispida* by a Specific *Rhizobium* Strain, 93
Sisco, R. Domingues, and others : The *Diego* Blood Factor, 40
Siskind, Prof. Charles S. : Electricity, Direct and Alternating Current, second edition, *review* by W. Fraser, 1101
Site of Hibernation of a Tachinid Larva within its Host (Prof. J. de Wilde and P H. van Doesburg), 1087
Sitka Spruce and Douglas Fir in America and Great Britain, 1207
Skelding, A. D. . Effect of Carbon Dioxide on the Manganese Absorption of Red Beet Tissue, 1038
Skelton, R. A. : Awarded the Gill Memorial for 1956 of the Royal Geographical Society, 606
  Awarded a Fellowship by the Leverhulme Trustees, 918
Skene, Prof Macgregor : Origin and Purpose of the Colston Research Society, 1019
Skidmore, M. R (McNally, un , J R., and) : Spectroscopy, 738
Skin Phospholipid Metabolism of (W. K Berry), 789
Skin (Frog) : Oxygen Consumption and Active Transport of Sodium in the Isolated, Short-circuited (Dr. K Zerahn), 937
Skin (Rabbits') : Incomplete Wound Contracture and the Phenomenon of Hair Neogenesis in (Dr. R. E. Billingham and Dr. P S. Russell), 791
Skin of Cattle . A Simple Method of Assessing the Moisture exuded through the (R. M. Mabon), 284
Skinner, D. J. Appointed veterinary officer, Kenya, 561
Skinner, L. G., and others : Reticulocyte Enzymes and Protein Synthesis, 190
Skjoldebrand, R., and others : Enrichment of Heavy Water by a Biological Method, 988
Skoog, Prof F. K : Elected a Member of the National Academy of Sciences, Washington, 926
Skrotzki, Bernhardt G. A. (edited by) · Electrical Transmission and Distribution, *review* by G. H. Platt, 297
Skull of a Beaked Whale, *Mesoplodon stejnegeri*, received by the British Museum (Natural History) from the Malacca Museums Board, 215
Sky : The Night, in February, 167 ; in March, 364 ; in April, 609 , in May, 779 ; in June, 968 ; in July, 1208

Skyhooks and Satellites, *review* by G. R. Noakes, 862
Skyrme, Dr. T. H. R. : Theoretical Physics, 268
Slade, Dr. R. E. : The Future of Mankind, *review*, 298
Slags and Foundry Sands : Microscopy of Ceramics and Cements, including Glasses, (Herbert Insley and Prof. Van Derek Fréchette), *review* by Dr. W. Campbell Smith, 640
Slater, Alan E. . Turbulence above the Ozone Layer, 1207
Slater, Prof. E. C. (Bouman, J., and) : Tocopherol Content of Heart-muscle Preparations, 1181
Slater, Dr. George *Obituary* by Dr. Gilbert Wilson, 459
Slater, T. F. : Awarded a Junior Beit Memorial Fellowship for Medical Research, 966
Slater, Sir William : The Evolution of Agricultural Research (Bernard Dyer Memorial Lecture of the Society for Analytical Chemistry), 651
Slavin, M. : Spectroscopy, 737
Slide-trap Method for the Isolation of Soil Fungi (Geoffrey W. F. Sewell), 708
Slip during Fatigue of an Age-hardened Alloy (T. Broom and V. N. Whittaker), 486

Sociological Association, International, and the International Economic Association : Symposium on the Positive Contribution by Immigrants, 1164
Soderberg, U (Ingvar, D. H., and) · A Direct Method for the Measurement of Cerebral Blood-flow, 339
Sodium in the Isolated, Short-circuited Frog Skin : Oxygen Consumption and Active Transport of (Dr. K. Zerahn), 937
Sodium-depleted Sheep : Delayed Effect of Ipsilateral Intracarotid Infusion of Sodium Chloride on the Composition of the Parotid Saliva of (I. R. McDonald and Dr. D. A. Denton), 1035
Sodium Chloride : Delayed Effect of Ipsilateral Intracarotid Infusion of, on the Composition of the Parotid Saliva of Sodium-depleted Sheep (I. R. McDonald and Dr. D. A. Denton), 1035
Soil Sectioning of (Shirley Hepple and Prof Alan Burges), 1186
  Thermal Conductivity of (John Webb), 989
Soil (Sand), under *Pinus radiata* . Mycelial Aggregation of (R. H. Thornton, J. D. Cowie and D. C. McDonald), 231
Soil *Corynebacterium* sp. . Potassium Ion Stimulation of Hydrocarbon Oxidation by a (J. N Ladd), 939
Soil Fungi A Slide-trap Method for the Isolation of (Geoffrey W F. Sewell), 708
Soil Nematodes · Lactophenol Preparations for (C K. Capstick), 896
Soil Science in India (Dr. S. P. Raychaudhuri), 1063
Soil Science in New Zealand (Proceedings of the New Zealand Society of Soil Science Conference on) 405
Soil Science, New Zealand Society for : Proceedings of the Conference on Soil Science in New Zealand, 608
Soil Survey of the Kpong Pilot Irrigation Area : Detailed (H Brammer), 118
Soil Thermometers (Z. S. Garvitch and M. C. Probine), 1245
Soil and Culture . Estimation of Numbers of Nitrosomonas in (J. W. Millbank), 848
Soil and Land-Use Survey, Department of (Gold Coast) Report on a Detailed Soil Survey of the Kpong Pilot Irrigation Area (H. Brammer), 118
Soil, Vegetation and Land-use Surveys in the Gold Coast, 118
Soils Production of Gliotoxin in (Joyce M. Wright), 896
  Reduction—Oxidation Level of (Carl Goran Lamm), 620
Soils (Natural Grassland) . *Rhizoctonia* in (R. H. Thornton), 230
Soja hispida · Influence of Day-length on Nodule Formation in, by a Specific *Rhizobium* Strain (Ch. Bonnier and C. Sironval), 93
Solanum : Tuber-bearing Species of (J. G. Hawkes), 927
Solar Activity Recent, 412
Solar Corpuscular Precipitation Spiral Patterning of (E. R. Hope), 571
Solar Energy Conference on, 110
  Use of (Dr. Harold Heywood), 110
Solar Energy (Applied) : World Symposium on, 110
Solar Energy Research (edited by Prof. Farrington Daniels and Dr. John A. Duffie), *review*, 1145
Solid Argon Thermal Conductivity of, at Low Temperatures (Dr. G. K. White and Dr. S B. Woods), 851
Solid Films (Thin) · Optical Properties of (Dr. O S. Heavens), *review*, 553
Solids : Melting of—Symposium in Ottawa (Dr T. H K Barron), 23
Soliman, Dr., Fouad A., and Badawi, Helmy M. . Levels of Thyroid and Thyrotrophic Hormones in the Blood of Rats at various Stages of the Œstrous Cycle, 235
'Solubilized' Chemicals for the Control of Plant Nematodes (L. N. Staniland), 97
Solute Concentration : Effect of, in the Irradiation of Aqueous Solutions by Ionizing Radiations (Dr. G. R. A. Johnson, Dr G Scholes and Dr J. Weiss), 883
Solution (Dilute) : Modification of the Bulk Mechanical Properties of Water by Complex Formation in (T. Nash), 948
Solutions (Aqueous) . Effect of Solute Concentration in the Irradiation of, by Ionizing Radiations (Dr. G. R. A. Johnson, Dr. G. Scholes and Dr. J. Weiss), 883

Solutions (Nitric Acid) : Solvent Extraction of Polonium from (J. Danon and A. A L. Zamith), 746
Solvent (A New), for Quantitative Paper Chromatography of Sugars (Dr. Giovanni Giovannozzi-Sermanni), 586
Solvent Extraction of Polonium from Nitric Acid Solutions (J. Danon and A. A L. Zamith), 746
Solvents : Organic (on the basis of the first edition by Arnold Weissberger. and Eric S. Proskauer), completely revised second edition by John A. Riddick and Emory E. Toops, Jr., *review*, 639
Solvents (Organic) . Ultra-Violet Absorption of Oxygen in (Allan U. Munck and Dr. Jesse F Scott), 587
Somerset, H. B. Appointed a member of the Advisory Council of the Commonwealth Scientific and Industrial Research Organization, 734
Somerville, Miss Mary : Retirement as controller of the Talks Division of the B.B.C., 361
Sond, J S , and others. Septate Fibres in Angiosperms and their Length, 1243
Sondes Place Research Institute : Booklet on the Organization and Services for Sponsored Research and Development in Chemistry, Chemical Engineering and Mechanical Engineering, 1206
Sondheimer, Dr E. H : Theoretical Physics, 269
Song Sparrows (Salt-Marsh) : Population Structure in (Richard F. Johnston), 1157
Sonic Scattering Layers of Heteropods (M. Blackburn), 374
Sonics—Techniques for the Use of Sound and Ultrasound in Engineering and Science (Theodor F. Hueter and Prof. Richard H. Bolt), *review* by Dr. H. D Parbrook, 4
Sonne Physik der Sternatmosphären, mit besonderer Berucksichtigung der (Prof A. Unsold), zweite Auflage, *review* by Dr. Arthur Beer, 1191
Sonnenfeld, E. D., and others . Reduction to Normal Levels of the High Erythrocyte Sedimentation-Rates in Apparently Healthy South African Bantu Men, 480
Sorbitol · Metabolism of (L. H. Adcock and Prof. C. H. Gray), 329
Sorensen, L. H. : Decomposition of Xylan by *Sporocytophaga myxococcoides*, 845
Sound : A Textbook of (Dr. A. B. Wood), third edition, *review* by Dr. W. H. George, 814
  Technology of, *review* by Dr. H. D. Parbrook, 4
Sound and Ultrasound in Engineering and Science : Sonics – Techniques for the Use of (Theodor F. Hueter and Prof. Richard H. Bolt), *review* by Dr. H. D Parbrook, 4
Sounds : Animal, in the Sea (Marie Poland Fish), 1117
Sounds (Animal) : Recording of (Conference at the Pennsylvania State University), 314
Source of 'Anomalies' in Amylose : Oxidation as a (H. Baum, Dr. G A. Gilbert and N. D. Scott), 889
Sources of Animal Behaviour (Prof. G. P. Wells), 372
South Africa Deoxyribonucleic Acid Deficiency in the Mature Egg Nucleus of *Aloe davyana* in (Dr. S. Krupko and A. Denley), 92
  The Striped Marlin (*Makaira audax* Phillipi) in (Prof. J. L. B. Smith), 758
South African Bantu Men . Reduction to Normal Levels of the High Erythrocyte Sedimentation-Rates in Apparently Healthy (A. R. P. Walker, D C. Fletcher, P. A Reynolds, I. Bersohn and E. D. Sonnenfeld), 480
South African Council for Scientific and Industrial Research · Ninth Annual Report (1953–54), 512
South American Orthoptera : .Cytogenetics of (Dr. Francisco A. Saez), 490
South Asia : International Conference on Mathematical Education in, 694
South-Eastern Union of Scientific Societies · Sixty-first Congress, 876
South-West of England : Geological and Geomorphological Research in the (University of Exeter Conference on), 166
Southern Latitudes (High) · Cosmic-Ray Increase observed at, on February 23, 1956 (Dr. A. G. Fenton, K. G. McCracken, N. R. Parsons and P. A. Trost), 1173
Southwell, G. A. : Appointed agricultural officer, Grenada, Windward Islands, 70
Soviet Professional Man-power (Nicholas De Witt), 51
Soviet Research in Microbiology in the Arctic and other Regions : Recent (W. G. Cass), 654
Soviet Union · Geographical Trends in the, 875
Space Frontier to (Eric Burgess), *review* by Prof. D. R. Bates, 202
Space (Expanding) : Influence of, on the Gravitational Fields surrounding Individual Stars (Prof. P C Vaidya and K. B. Shah), 802
Space Travel . Relativity and (Prof. Herbert Dingle), 782, 785 ; (Prof. W. H. McCrea), 784
Spalding, Dr. D. B. : Some Fundamentals of Combustion, *review* by F. D. Robinson, 548
Span (Optimal), of Working Life, *review* by Prof. John Cohen, 449
Spanish Academy of Pharmacy, Royal Election of T. D. Whittet as a Foreign Member, 1018
Spanner, Dr. D. C . Appointed to the University of London readership in botany at Bedford College, 609
Spark Circuits (Multigap) : Absence of Shock Hazards with certain (D. A. Sinclair), 1175
Spark Spectra : Spectrochemical Analysis with Time-Resolved (Dr. Á. Bardócz and F. Varsányi), 222
Spasmolytic Effect of Cerebral Tissue Extracts (Dr. O. C. Forbes), 893
Spawning of the Sardine at a Definite Time of Day (T. Gamulin and J. Hure), 193
Speakman, Dr J. C. : An Introduction to the Electronic Theory of Valency, third edition, *review* by G. Fowles, 909
Special Relativity : A New Synthesis of, *review* by Prof H. S. Ruse, 906
Species (New), of Root-Knot Nematode : *Meloidogyne acronea*, a (Dr. V. Coetzee), 899
Specificity (Anticoagulant), and Physiologically Inactive Beta-Prothromboplastin (Dr. P. Fantl and Dr. R. J. Sawers), 1233
Specimens (Natural History) : The Preservation of (edited and compiled by Reginald Wagstaffe and Dr. J. Havelock Fidler), Vol. I, Invertebrates, *review* by W. Eric Stoneman, 679
Spectra (Absorption), arising from the Photolysis of Lead Tetramethyl (Dr. C. L. Cook and J. G. Clouston), 1178
Spectra (Infra-Red), of Chelating Agents—2-Phenacylpyridine Derivatives (R. F. Branch), 671
Spectra (Infra-Red Absorption), and Protein-Sugar Interactions (J. D. S. Goulden), 85
Spectra (Molecular) · Elementary Introduction to (Børge Bak), *review* by Dr. R. F. Barrow, 352
Spectra (Spark) : Spectrochemical Analysis with Time-Resolved (Dr. Á. Bardócz and F Varsányi), 222
Spectrochemical Analysis with Time-Resolved Spark Spectra (Dr. Á. Bardócz and F Varsányi), 222
Spectrophotometric Method for the Estimation of Vitamin K_3 (Vanamala Sathe, J. B. Dave and Dr. C. V. Ramakrishnan), 276
Spectroscopic Properties of Ellagic Acid . Chromatographic and, and its Occurrence in Dicotyledonous Plants (Dr. D. E. Hathway), 747
Spectroscopical Colloquium : Sixth International, 653
Spectroscopy . Atomic—Symposium at the Argonne National Laboratory (Dr. L. F. H. Bovey) 737
  Microwave (Prof. C. H. Townes and A. L Schawlow), *review* by Dr. D. M. S. Bagguley, 1099
  Molecular Structure and (Symposium at the Ohio State University), 693
Spectroscopy at Centimetre Wave-lengths, *review* by Dr. D. M. S. Bagguley, 1099
Spectroscopy at Radio and Microwave Frequencies (Dr. D. J. E. Ingram), *review* by Dr. D. M. S Bagguley, 1099
Spectroscopy (Infra-Red) : Applications of (Society of Chemical Industry Symposium on), 415
Spectroscopy (Infra-Red), and Chemical Industry (Dr. H. W. Thompson), 915
Spectrum (Adsorption), of Nitrogen on Tungsten (Dr. Gert Ehrlich and Dr. T. W. Hickmott), 1045
Spectrum (Flame), of Barium—Red and Infra-Red Bands (Miss E. M. Bulewicz), 670
Speed (High-) Flight Propulsion Problems in (H Constant), 1196
Speed (High-) Photography : Third International Congress on (Department of Scientific and Industrial Research), 876
Speeds (Very High) : The Physics of Gas Flow at (Physical Society Summer Meeting on), 1064
Spencer, Dr. B., and others : Examples of Anti-competitive Inhibition, 432
Spencer, J. G., and others Visibility of Noise in Television, 519
Sperm (Labelled) : Labelled Pronuclei in Mouse Eggs fertilized with (R. G. Edwards and J L. Sirlin), 429
Spermiogenesis (Bandicoot) : Acrosome Formation in (K W. Cleland), 387
Spheres 'Pearl-String' Artefacts in a Random Scatter of (J. H Fessler), 439
Spherical Particles : Aggregation of (G. W. Hastings, D. W. Ovenall and Dr. F. W. Peaker), 1091
Sphering Factor in Rat and Mouse Plasma : An Erythrocyte (Dr. R. Barer and F M Gaffney), 377
Spherules (Cosmic), in Deep-Sea Sediments (Kurt Fredriksson), 32
Spiers, Prof. F. W. . Genetical Effects of Radiations from Products of Nuclear Explosions, 226
Spindle : Nucleus and, of *Bacillus megatherium* in Fission and Sporulation (Dr. Akira Yuasa), 336 ; (M H, Jeynes), 849
Spinning Joint for a Rotary Film Evaporator : A Simple (K. L. Bocock and Dr. O. Gilbert), 439
Spiracular Control of Discontinuous Respiration in Insects (Dr. Howard A. Schneiderman), 1165
Spiral Patterning of Solar Corpuscular Precipitation (E. R. Hope), 571
Splitting of Aesculin by Yeasts (J. A Barnett and Dr. T. S. Swain), 133
Spontaneous Chromosome Breakage in Endosperm (Dr. A. Rutishauser and L. F. La Cour), 324
Sporelings of Bracken : Effect of Gamma-(2 : 4-Dichlorophenyoxy)-butyric Acid on (Dr Elsie Conway), 1088
Spores of various Bacteria An Unidentified Amino-sugar present in Cell Walls and (R. E. Strange and F A Dark), 186
Spores (Viable Fungal) : A Gas Phase in (Prof. C. T. Ingold), 1242
Sporocytophaga myxococcoides : Decomposition of Xylan by (L. H. Sorensen), 845
Sporulation · Nucleus and Spindle of *Bacillus megatherium* in Fission and (Dr. Akira Yuasa), 386 , (M. H. Jeynes), 849
Sporulation of Fungi inside the Plant Host Cell (Hussein M. Elarosi), 665
Spottiswoode, Raymond and Nigel : The Theory of Stereoscopic Transmission and its Application to the Motion Picture, *review* by Prof. W. D. Wright, 202
Spray, Dr. G. H · Diet and Anæmia, 878
Springall, Prof. H. D. . The Structural Chemistry of Proteins, *review* by Prof. J. A. V. Butler 404
Springboard for Supersonic Flight, *review* by Prof. L. Rosenhead, 400
Spruce (Sitka), and Douglas Fir in America and Great Britain, 1207
Spurlin, Harold M., and others (edited by) : Cellulose and Cellulose Derivatives, second edition, *review* by Prof E. L. Hirst, 677
Sputtering (Cathodic) : A New Apparatus for (L. Holland), 1229
Sq Current System : Region *E* and the (Dr. W. J. G. Beynon and G. M. Brown), 583
Squire, F. A., and others : Responses of Domestic Animals to Infections of *Trypanosoma vivax*, *T. congolense* and *T. brucei*, 332
Sreenivasa Murthy, V., and others : Effect of Vitamin B_{12} Deficiency on Liver Dehydrogenase Activity in Rats, 750
Sreenivasaya, M., and others Occurrence and Nature of an Amœba Excystment Factor produced by *Aerobacter* sp., 621
St. Mary's Hospital Medical School Appointment of Dr. W. S. Peart to the University of London chair of medicine, 1159
Stability of Iso-alleles (Dr. Aloha M. Hannah and Dr. Curt Stern), 42
Stabilized Interference Fringes on the Retina (Prof. R. W Ditchburn and R. M. Pritchard), 434
Stacey, Prof. M. . Appointed to the Mason chair of chemistry in the University of Birmingham, 1156 ; work of, 1156
Stacey, Prof. M., and others : Ionophoresis of Oligosaccharides as N-Benzylglycosylammonium Ions, 1125
Stadler, Dr. : Semi- and Non-Crystalline Materials, 121
Staffing the United Kingdom Atomic Energy Authority, 16
Stafford, Anne (Rand, M., and) · A Method for Determining the Duration of Action of the Cardiac Glycosides, 278
Stagg, Dr. J. M : Analysis of Weather Charts, *review*, 956
Staining of Wool by Bacterial Pigments (I. E. B. Fraser and A. P. Mulcock), 628

Staining Procedure after Paper Electrophoresis : Control of the (Dr. Ch. Wunderly), 586

Stainless Steel : Electrochemistry of, in Sulphuric Acid (Dr. G. H. Cartledge), 181

Stainsby, Dr. G. : Gelatin Light-scattering, by a New Enzymic Digestion Technique, 745

Stakman (Elvin Charles) Award of the University of Minnesota given to Prof. W. L. Waterhouse, 1208

Standard of Length and the Standard of Time (Dr. Albert Pérard), 850

Standard of Time : The Standard of Length and the (Dr. Albert Pérard), 850

Standards (Calculable), of Capacitance : A New Theorem in Electrostatics and its Application to (A. M. Thompson and Dr. D. G. Lampard), 888

Standards (Radioactivity) : International Comparisons of (Dr. A. V. Astin, Sir Edward Bullard and Dr. W. B. Lewis), 12

Stanford Research Institute, California : Resignation of Dr. Jesse E. Hobson from the directorship, 167
  Report for 1955, 1213

Stanford Research Institute and the University of California : Symposium on Methods, Materials and Processes involved in the Uses of High Temperatures in Science and Industry, 693

Stanford University, California : Dr. R. N. Bracewell has joined the Radio Propagation Laboratory as associate professor of electrical engineering, 831

Stanford University School of Medicine : Grant of 1,000,000 dollars from the Commonwealth Fund, New York, for medical education, 1064

Staniland, L. N. : 'Solubilized' Chemicals for the Control of Plant Nematodes, 97

Stanley, G. J., and Price, R. : An Investigation of Monochromatic Radio Emission of Deuterium from the Galaxy, 1221

Stanley, Dr. N. F. : Appointed to the chair of microbiology in the Medical School of the University of Western Australia, Perth, 1065

Stanton, Dr. Alfred H., and Schwartz, Dr. Morris S. : The Mental Hospital, *review* by Dr. G. M. Carstairs, 250

Staphylococcus aureus : Production of Opacity on Serum Agar Plates by some Strains of (A. J. H. Tomlinson and M. T. Parker), 895

Starch (Arbeitsgemeinschaft Getreidesforschung e. V., Detmold, Conference on), 562

Starch Gel : Tests of Purity of Diphtheria Toxins by Electrophoresis in (M. D. Poulik), 982

Starfish, *Asterias forbesi* : Role of the Terminal Pigment Spots of the, in Light Orientation (Prof. M. Rockstein), 341

Starling, Sidney G. : *Obituary* by William Swaine, 459

Stars : Influence of Expanding Space on the Gravitational Fields surrounding Individual (Prof. P. C. Vaidya and K. B. Shah), 802

Stars (Double) : The Need for Observations in the Older Branches of Astronomy, especially (Dr. J. Jackson), 975

State Agricultural College, Ghent : Eighth Symposium on Phytopharmacie et de Phytiatrie, 779

State Agricultural University, Wageningen : Conference on Chromosomes, 464

State Institute for Human Genetics, Upsala : Grant of 50,000 dollars from the Rockefeller Foundation, New York, for research work to be shared with the University of Upsala and the Royal Agricultural College, 976

State University of Utrecht : Degree of doctor of medicine *honoris causa* given to Prof. D. Keilin, 831

Static and Dynamic Stress-Strain Relationship of Bonded Rubber in Compression : Effect of Shape on the (A. R. Payne), 1174

Statistical Inference : Probability and, *review* by Prof. M. G. Kendall, 679

Statistical Review of England and Wales for the Year 1952 : Text Volume of the Registrar General's (General Register Office), 313

Statistics : The Foundations of (Prof. Leonard J. Savage), *review* by Prof. M. G. Kendall, 679
  Theoretical, *review* by Prof. M. G. Kendall, 813

Statistics in Personnel Management : The Use of (Institute of Personnel Management and the National Institute of Industrial Psychology Course on), 779

Statistics of Scientific Workers and Technologists in Britain, 828

Statistics of Therapeutic Trials (Dr. G. Herdan), *review* by Prof. J. H. Gaddum, 1007

Statistics (Mathematical) : Introduction to (Prof. Paul G. Hoel), second edition, *review* by Prof. M. G. Kendall, 813

Statistics and Aerodynamics of the Sea Surface (Royal Meteorological Society Symposia on), 62

Statistics and Agricultural and Dairy Engineering : Postgraduate Scholarships in Agricultural Economics, Husbandry, (Ministry of Agriculture, Fisheries and Food, and the Department of Agriculture for Scotland), 415

Status of *Protobatrachus massinoti* (I. Griffiths), 342

Staub, J. B. G. S. : Appointed registrar, Central Board, Mauritius, 736

Staud, Dr. C. J. : Appointed vice-president in charge of research and development, Eastman Kodak Company, 360 ; work of, 360

Staudinger, Dr. J. J. P. : Epoxide Resins, 962

Steacie, Dr. E. W. R. : Government Responsibility in Industrial Research, 172

Stebbing, Prof. E. P. : Forestry Commission—Report for 1954, 926
  Obituary of Sir John Stirling-Maxwell, 1154

Steel, R. W. : Into the Blue, the Lake Tana Expedition, *review*, 6

Steel : Change of Hardness in, due to Hydrogen (H. G. Vaughan and M. E. de Morton), 1225

Steel (Stainless) : Electrochemistry of, in Sulphuric Acid (Dr. G. H. Cartledge), 181

Steel Castings Research Association, British : Appointment of Dr. A. H. Sully as director of research, 415

Steel Community : European Coal and (Political and Economic Planning, Broadsheet No. 389), 1205

Steel Community, European Coal and (Council of Europe and the High Authority of the) : Fellowships for Research into Problems of European Interest, 263

Steels (Low-alloy) : Hair-line Cracks in (A. Barker and A. Wainwright), 1136

Steenrod, Prof. N. E. : Elected a Member of the National Academy of Sciences, Washington, 926

Steeple, Dr. H. : Mechanism of Phase Transformations in Metals, 420

Stegemann, Dr. H., and Toennies, Dr. G. : A Rapid Variable-Temperature Micro- or Macro-Dialyser, 440

Steinhaus, D. W. : Spectroscopy, 737

Stellar Atmospheres : Physics of, *review* by Dr. Arthur Beer, 1191

Stenz, Prof. Edward : *Obituary* by Dr. Józef Mazur, 1014

Stephen, Dr. A. M. : Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 165

Stephen, Dr. M. J. : Elected a Salters' Fellow for 1956–57 by the Salters' Company, 1113

Stephens, Prof. A. V. : Appointed to the chair of aeronautical engineering in Queen's University, Belfast, 507 ; work of, 507

Stephens, Miss Gayner : Fibre Microscopy, 516

Stephens, Dr. R. W. B. : The Possible Uses of Surface Methods as a Means of Testing Metals (with Special Reference to Optical Methods), 565
  Title of reader in acoustics in the University of London conferred on, 1208

Stephenson, N. C., and others : Some New Stereochemical Arrangements of Divalent Palladium and Platinum, 1127

Stereochemical Arrangements of Divalent Palladium and Platinum : Some New (Dr. C. M. Harris, Prof. R. S. Nyholm and N. C. Stephenson), 1127

Stereochemistry : Progress in (edited by Dr. W. Klyne), Vol. 1, *review* by Dr. J. W. Linnett, 811
  Recent Advances in, *review* by Dr. J. W. Linnett, 811

Stereoscopic Transmission : The Theory of, and its Application to the Motion Picture (Raymond and Nigel Spottiswoode), *review* by Prof. W. D. Wright, 202

Steric Effects in Anionotropic Rearrangements (Prof. E. A. Braude, Dr. J. A. Coles, Dr. E. A. Evans and Dr. C. J. Timmons), 1167

Sterility : Second World Congress on Fertility and (International Fertility Association), 693

Stern, Dr. A. L. : *Obituary*, 871

Stern, Dr. Curt (Hannah, Dr. Aloha M., and) : Stability of Iso-alleles, 42

Stern, Dr. F. : Fibre Microscopy, 516

Stern, Prof. Kurt G. : *Obituary* by Prof. H. Mark, 556

Sternatmospharen : Physik der, mit besonderer Berucksichtigung der Sonne (Prof. A. Unsold), zweite Auflage, *review* by Dr. Arthur Beer, 1191

Steven, R. M. : Appointed principal agricultural officer, Sierra Leone, 70

Stevens, Dr. K. W. H. : Theoretical Physics, 269

Stevin, Simon : The Principal Works of (edited by Ernst Crone, E. J. Dijksterhuis, R. J. Forbes, M. G. J. Minnaert and A. Pannekoek), Vol. I, General Introduction, Mechanics, *review* by Prof. E. N. da C. Andrade, 3

Steward, E. G., and others : Electroluminescence in Disordered Zinc Sulphide, 240

Stewart, G. A. : Elected a Fellow of the Royal Society of Edinburgh, 507

Stewart, Dr. K. H. : Ferromagnetic Domains, *review*, 154

Stewart, W. : Appointed chief pharmacist, Eastern Region, Nigeria, 1112

Stewart, Group-Captain W. K. : Awarded the Wakefield Gold Medal by the Royal Aeronautical Society, 919

Stewartson, R. : Awarded an Ablett Prize for 1955 of the Iron and Steel Institute, 919

Still (Laboratory) ? : Will Ion Exchange replace the (W. F. Lorch), 509

Stimulation by Flickering Light : Colour Illusions and Aberrations during (Dr. W. Grey Walter), 710

Stimulation of Yield from Rubber Trees (E. D. C. Baptist and P. de Jonge), 1073

Stimulator for the Release of Prolactin from the Anterior Pituitary : Oxytocin as (G. K. Benson and Dr. S. J. Folley), 700

Stimulatory Action of Indole-3-Acetic Acid on the Uptake of Amino-Acids by Plant Cells (Leonora Reinhold and R. G. Powell), 658

Stirling, Dr. M. W. : Auca Indians, 777

Stirling-Maxwell, Sir John : *Obituary* by Prof. E. P. Stebbing, 1154

Stirpe, F., and others : Coupled Oxidation of Keto-Acids with Glutathione, 1232

Stockmayer, Prof. W. H. : Elected a Member of the National Academy of Sciences, Washington, 926

Stokes, Adrian : Michelangelo, a Study in the Nature of Art, *review* by F. I. G. Rawlins, 451

Stommel, Henry : National Oceanographic Council—Report for 1954–55, 1025

Stone, Nancy E., and others : Plasma Protein as a Precursor of Rat Liver and Hepatoma Protein, 138

Stoneman, W. Eric : A Handbook for Museum Curators, *review*, 679

Stoner, C. R. : Services' Text-Book of Radio, *review*, 1192

Storage : Corrosion Prevention in Packaging and (Corrosion Group and the Birmingham and Midland Section of the Society of Chemical Industry Symposium on), 511

Storage of Vitamin A Ester and Alcohol in the Liver of the Rat : Effect of Blocking the Reticulo-endothelial System on the (Dr. S. Krishnamurthy and J. Ganguly), 575

Storage Tests (Accelerated), for Dehydrated Vegetables (E. G. B. Gooding and R. B. Duckworth), 897

Storrs, A. E. G. : Appointed assistant conservator of forests, Northern Rhodesia, 1112

Story, J. S. : Numerical Tables for Nuclear Physics, *review*, 57

Strachey, James (translated from the German and edited by) : The Interpretation of Dreams (Sigmund Freud), *review* by Sir Cyril Burt, 495

Strain of Tobacco Mosaic Virus : Reversible, Host-induced, Changes in a (F. C. Bawden), 302

Strains of *Staphylococcus aureus* : Production of Opacity on Serum Agar Plates by some (A. J. H. Tomlinson and M. T. Parker), 895

Straits of Dover : Currents Through the (Prof. K. F. Bowden), 881

Strang, Lord : Re-appointed a member of the Nature Conservancy, 1015

Strange, R. E., and Dark, F. A. : An Unidentified Amino-sugar present in Cell Walls and Spores of various Bacteria, 186

Stranks, Dr. D. R. : Awarded the Rennie Memorial Medal of the Royal Australian Chemical Institute, 919

Strathdee, Dr. R. B. : *Obituary* of T. Harold Reade, 917

Stratigraphic Geology (Maurice Gignoux), English translation from the fourth French edition by Gwendolyn G. Woodford, *review* by Prof. F. E. Zeuner, 909

Stratosphere : Compressed Air Hygrometer for Measuring Frost Point in the (R. J. Murgatroyd, P. Goldsmith and W E. H. Hollings), 568
Stratton, Prof. F. J. M. : The Haunting of Borley Rectory, *review*, 595
Obituary of Prof. Megh Nad Saha, 917
Obituary of Dr. Walter Sydney Adams, 1201
Stratton, G. Burder (edited by) : The Zoological Record, Vol 89, Being the Records of Zoological Literature relating chiefly to the Year 1952, *review* by Dr. Edward Hindle, 200
Strawberry : Leafhopper Transmission of a Clover Virus causing Green Petal Disease in (N. W. Frazier and A. F. Posnette), 1040
Strecker, H. J., and others : Action of Chlorpromazine on Oxidative Phosphorylation of Liver and Brain Mitochondria, 1234
Strecker, R. L., and Emlen, jun., John T. · Populations of House-Mice, 692
Stredder, J. C. : The Teaching of Chemical Principles in School and University, 73
The Science Master's Book, *review*, 957
Street, Dr. R. : Some Recent Developments in Magnetism, 518
Streiff, Anton J., and others : Hydrocarbons from Petroleum, *review*, 401
Stress-Strain Relationship of Bonded Rubber in Compression : Effect of Shape on the Static and Dynamic (A. R. Payne), 1174
Streptomycin : Effect of, on *Acetobacter capsulatum* and its Associated Dextran-Dextrinase Enzyme System (Dr. B. H. Arnold and Dr. A. N. Hall), 44
Stress (Yield), of Clay-Water Systems (Dr. A. Packter), 144
Stress (Yield), and Coefficient of Work-hardening in Polycrystalline Metals : Relation between the Initial Instantaneous Extension in Creep and the (Dr. Paul Feltham), 632
Strigomonas (Herpetomonas) oncopelti · A Synthetic Growth Medium for the Trypanosomid Flagellate (B. A. Newton), 279
Striped Marlin (*Makaira audax* Phillipi) in South Africa (Prof. J. L. B. Smith), 758
Stroke, G. W. : Spectroscopy, 737
Structural Chemistry of Proteins (Prof. H. D. Springall), *review* by Prof. J. A. V. Butler, 404
Structure of Azulene (Prof. J. Monteath Robertson and Dr. H. M. M. Shearer), 885
Structure of 3 · 4-Benzpyrene (Dr. J. Iball and D. W. Young), 985
Structure of Bushy Stunt Virus (Dr. D. L. D. Caspar), 475
Structure of Collagen (Prof. G. N. Ramachandran), 710
Structure of Fronts in Meteorology, 656
Structure of Nucleic Acids and their Role in Protein Synthesis (Biochemical Society Symposium on), 602
Structure of Semi- and Non-Crystalline Materials (Dr. U. W. Arndt), 121, *erratum*, 314
Structure of Small Viruses (Dr. F. H. C. Crick and Dr. J. D. Watson), 473 , Structure of Bushy Stunt Virus (Dr. D. L. D. Caspar), 475
Structure of Tobacco Mosaic Virus—Radial Density Distribution in the Tobacco Mosaic Virus Particle (Dr. D L. D. Caspar), 928 ; Location of the Ribonucleic Acid in the Tobacco Mosaic Virus Particle (Dr. Rosalind E. Franklin), 928
Structure (Crystal), of Bisacetylacetone-nickel (II) : Trinuclear Molecules in the (Dr. G. J. Bullen), 537
Structure (Crystal), of *p*-Chlorbenzene Iododichloride (D. A.-Bekoe and Ralph Hulme), 1230
Structure (Crystal), of Glycyl-L-Alanine Hydrochloride (Dr. T. C. Tranter), 37
Structure (Crystal), of Tobermorite (Dr. H. D. Megaw and C. H. Kelsey), 390
Structure (Fine), of the Insect Retinula as revealed by Electron Microscopy (Dr. Humberto Fernández-Moran), 742
Structure (Molecular), and Spectroscopy (Symposium at the Ohio State University), 693
Structures . Non-Destructive Testing of Materials and (Proceedings of the International Symposium on), (International Union of Testing and Research Laboratories for Materials and Structures), 468
Plastic Theory of (Symposium at the University of Cambridge), 1208
Structures (Organic) : Determination of, by Physical Methods (edited by E A. Braude and F. C. Nachod), *review* by Dr. W. A. Waters, 721
Structures and Functions of the Phenolase Complex (Dr. H. S. Mason), 79-
Strzemienski, K. : A Combinatorial Design for Experiments with Alternative Responses, 283
Stuart (Herbert Akroyd) Memorial Prize of the Royal Aeronautical Society awarded to O. N. Lawrence, 919
Student-Apprenticeship Scheme (Admiralty), 215
Students for Technical Experience, International Association for the Exchange of, 118
Students (Chemistry) : Mathematics for, *review*, 678
Students (Research), in the United States of America (H. N. V. Temperley), 455
Students (Technical) : Frederick D. Edwards Trust for Financial Help for, 1204
Students (University) : Future Numbers of—the Desperate Need for Technologists (Lord Simon of Wythenshawe), 1214
Study of the British Flora : Progress in the (Botanical Society of the British Isles Conference on), 1162
Study of the Function of the Cow's Udder : A Radiographic Method for the (Dr. J. Bilek and Dr. M. Janovsky), 582
Study of Insect Migration : A Photographic Method for the (H. J. Sayer), 226
Study of Oxide Films on Metals : Use of Capacity Measurements for the (J. N. Wanklyn), 849
Study of Social Insects, International Union for the : Formation of a British Section, 69
Studying Winds in the Ionosphere by using Continuous-Wave Radio : A Simple Method of (Dr. B. Ramachandra Rao and D. Satyanarayana Murty), 1222
Stutinsky, Dr. F. : The Neurohypophysis, 1020
Sublethal Doses of Fluoroacetate : Response of the Sheep to (I. G. Jarrett and Angus Packham), 580
Sublines of Two Mouse Ascites Tumours : Nucleic Acid Content and Distribution of Chromosome Number in Original and (Dr. John S. Colter, Harris H. Bird, Hilary Koprowski and Hilda B. Ritter), 993
Sublingual Gland of the Cat : Secretory Potentials and Secretion in the (Dr. Anders Lundberg), 1080
Submicroscopic Structures of Adrenergic Axons : Evidence for the Presence of Noradrenaline in (Prof U. S. von Euler and N.-Å Hillarp), 44
Subrahmanyam, S. V. : Dependence of the Elastic Properties of Cadmium on Temperature, 852
Substituted Benzenesulphonanilides as Synergists for DDT (M. Neeman, A. Modiano, G. G. Mer and R. Cwilich), 800
Successful Foundation Material in Cross-Species Bone Grafts : Bone treated with Ethylenediamine as a (Dr. Fred L. Losee and Lieut. Lloyd A. Hurley), 1032
Sudden Decrease in Low-frequency Atmospheric Noise during the Cosmic-Radiation Storm of February 23 (C. A. McKerrow), 1223
Sugars . A New Solvent for Quantitative Paper Chromatography of (Dr. Giovanni Giovannozzi-Sermanni), 586
Temperature Effects in the Paper Partition Chromatography of (Margaret Alcock and J. S. Cannell), 327
Sugars in Freeze-dried Apricots : Reactions between Amino-Acids, Organic Acids and (E. E. L. J. Anet and T. M. Reynolds), 1082
Suicide in London, an Ecological Study (Peter Sainsbury), (Institute of Psychiatry, Maudsley Monographs, No. 1), *review*, 404
Sullivan, F. H : Spectroscopy, 737
Sullivan, Frank M. (Sharman, D. F., and): 5-Hydroxytryptamine in Serum, 332
Sully, Dr. A H. : Appointed director of research to the British Steel Castings Research Association, 415
Sulphate Deficiency of Lake Victoria (Dr. P. R. Hesse), 389
Sulphate (Alkyl) Soaps : Polymorphism of (Prof. J. A. Prins and W. Prins), 535
Sulphated Animal Hyaluronate · Lipæmia Clearing Action of (Prof. Theodore Gillman, Michael Hathorn and Jack Penn), 894
Sulphide (Disordered Zinc) : Electroluminescence in (M. A. Short, E. G. Steward and T B. Tomlinson), 240
Sulphonates (Alkyl) : Tumour Growth-inhibitory (Prof. A. Haddow and Dr. W. C. J. Ross), 395
Sulphuric Acid : Electrochemistry of Stainless Steel in (Dr. G. H Cartledge), 181
Summer Course on Oilfield Reservoir Engineering (University of Birmingham), 1065
Summer Laboratory Course on Techniques and Applications of the Electron Microscope (Department of Engineering Physics of Cornell University), 922
Summer School in Programme Design for Automatic Digital Computing Machines (Mathematical Laboratory of the University of Cambridge), 922
Summer School in Theoretical Chemistry (University of Oxford), 562
Summer School on Welding (British Welding Research Association), 922
Sumner, Dr W. L. : Mumps, Measles and Mosaics, *review*, 1007
Essays on Science, *review*, 1097
Sun . Daily Maps of the (F. A. Wayman), 518
Sun and its Influence (Dr. M. A. Ellison), *review* by Dr. A. Hunter, 1008
Sunderland, Dr. N. . Leaf Growth, 1114
Sunnanaa, Klaus : Elected president of the Permanent Commission of the International Fisheries Convention, 920
Sunspot and Geomagnetic-Storm Data derived from Greenwich Observations, 1874–1954 (compiled under the direction of Sir Harold Spencer Jones), *review*, 499
Superficial Reactions of Gases on Metals (Annual Meeting of the Société de Chimie physique), 693
Superoxide (Calcium) Formation of (Prof. Cyrill Brosset and Nils-Gosta Vannerberg), 238
Supersonic Flight : Springboard for, *review* by Prof. L. Rosenhead, 400
Supplementary Choline and Methionine : Effect of, on the Response of Chickens to Folic Acid (M. W. McDonald), 343
Support (Government), of Agricultural Research in Britain, 68
Support (Government), for Research in Great Britain, 761
Suppressed Frame System of Telerecording (C. B. B. Wood, A. V. Lord, E. R. Rout and R F. Vigurs), 519
Suramin Complexes in Animal Trypanosomiasis : Prophylactic Activity of (Dr. J. Williamson and Dr. R. S. Desowitz), 1074
Surface (Earth's) . Heat Convection from the (C. H. B. Priestley), 435
Surface Membrane in *E. coli* : A Dielectric Study of the Low-Conductance (Dr Hugo Fricke, Herman P. Schwan, Kam Li and Vernon Bryson), 134
Surface Methods as a Means of Testing Metals (with Special Reference to Optical Methods) : The Possible Uses of (Non-Destructive Testing Group of the Institute of Physics Symposium on), 564
Surface Treatment for the Improvement of Mechanical Properties and Protection against Corrosion (Sixth International Mechanical Engineering Congress), 922
Surface Water Year Book of Great Britain, 1945–53 (Ministry of Housing and Local Government · Scottish Office), 75
Survey of India : Historical Records of the (collected and compiled by Colonel R. H. Phillimore), Vol. 3, 1815 to 1830, *review* by Brigadier G. F. Heaney, 444
Survey of Programmes of Social Development : International (Bureau of Social Affairs of the United Nations Secretariat, in co-operation with the International Labour Office, Unesco, the Food and Agriculture Organization and the World Health Organization), 421
Survival Factor in Rats Deficient in the Animal Protein Factors of Casein : Orotic Acid as a (A. Rabbi, M. Marchetti, R. Viviani and Prof. G. Moruzzi), 757
Sussex : The Archæology of (E. Cecil Curwen), second edition, *review* by Miles Burkitt, 301
Sutcliffe, Dr. J. F. (Dale, J E, and) : Inhibition of Salt Absorption in Red Beet Root Tissue, 192
Sutcliffe, P. Appointed lecturer in civil engineering at the University of Leeds, 1017
Sutcliffe, Dr. R. C. : Large-Scale Weather Processes, 113
Sutherland, Prof. G. B. B. M. : Appointed director of the National Physical Laboratory, 260 , work of, 260
Sutton, Sir Graham · Appointed a member of the Nature Conservancy, 1015
Sutton, Dr. John · Title of reader in geology in the University of London conferred on, 314

Sutton, Dr. L. E.: Collection and Classification of Crystallographic Data, 1069
Suzuki, Noboru, and others: Resolution by means of a Micro-organism of Racemic Diaminosuccinic Acid and Determination of its Configuration, 280
Suzuki, Sakaru, and others: Resolution by means of a Micro-organism of Racemic Diaminosuccinic Acid and Determination of its Configuration, 280
Suzuki, T., and Willis, B. T. M.: Diffraction from Dislocations, 712
Svennerholm, Prof. Lars: Composition of Gangliosides from Human Brain, 524
Swaby, L. K. A.: Appointed senior agricultural officer, Jamaica, 1207
Swain, Dr. T.: Chemistry of Oxygenated Heterocyclic Compounds, 1117
Swain, Dr. T., and Bate-Smith, Dr. E. C.: Vegetable Tannins, 880
Swain, Dr. T. (Barnett, J. A., and): Splitting of Aesculin by Yeasts, 133
Swaine, William: *Obituary* of Sidney G. Starling, 459
Swallen, J. R.: Flora of Guatemala, Part 2, Grasses, 1025
Swaminathan, M., and others: Effect of Vitamin B_{12} Deficiency on Liver Dehydrogenase Activity in Rats, 750
Swann, C. Kirke: Books in Short Supply, 612
Swann, Dr. W. F. G.: Honorary Fellowship of the Imperial College of Science and Technology conferred on, 733
Sweating: Seasonal (P. C. B. MacKinnon and Dr. I. L. MacKinnon), 799
Sweating in Cattle: Adrenergic (G. C. Taneja), 482
Swellengrebel, E. J. G.: Appointed assistant conservator of forests, British Guiana, 831
Swellengrebel, Prof. N. H.: *Obituary* of Sir Malcolm Watson, 162
Swimming of Fishes (Dr. A. G. Lowndes), 194
Swimming-Pool Reactor at Harwell for the Study of Shielding Problems, 777
Sykes, B.: Promoted to Deputy Chief Scientific Officer in the Scientific Civil Service, 218; work of, 218
Sykes, Dr. C.: Awarded the Bessemer Gold Medal for 1956 of the Iron and Steel Institute, 919
Sykes, Dr. K. W.: Appointed to the University of London chair of physical chemistry in Queen Mary College, 68; work of, 68
Sylviculture in Great Britain: Studies of North-West American Forests in relation to (R. F. Wood), 1207
Symbols for the International Geophysical Year, 559
Symington, Prof. T.: Elected a Fellow of the Royal Society of Edinburgh, 507
Symon, D. E.: Polyembryony in *Cassia*, 191
Synergists for DDT: Substituted Benzenesulphonanilides as (M. Neeman, A. Modiano, G. G. Mer and R. Cwilich), 800
Synge, Prof. J. L.: Relativity, the Special Theory, *review* by Prof. H. S. Ruse, 906
Syntheses: Organic (edited by William S. Johnson), Vol. 34, 1954, *review* by Prof. John Read, 301
Synthesis: Automatic Feedback Control System (Prof. John G. Truxal), *review* by Prof. A. Tustin, 106
Synthesis of the Amino-acids of Silk by *Bombyx mori*: Utilization of the Carboxyl Carbon of L-Phenylalanine for the (S. Bricteux-Grégoire, W. G. Verly and Prof. M. Florkin), 1237
Synthesis of 1: 8-Diaza*cyclo*-tetradecane: Cyclic Polyamides from Nylon 6 and 6 6 Polymers— (M. A. Thorold Rogers), 128
Synthesis of β-Galactosidase in *Ophiostoma multiannulatum* and some Properties of the Enzyme (Dr. B. v. Hofsten), 844
Synthesis of Long-Chain Fats by Bacteria isolated from Human Fæces (Dr. H. G. Sammons, D. J. Vaughan and A. C. Frazer), 237
Synthesis of Peptides: New Methods for the (Dr. J. Kollonitsch, V. Gábor and A. Hajós), 841
Synthesis (Enzymic), and Properties of a Polynucleotide from Adenosine Diphosphate (Dr. Roland F. Beers, jun.), 790
Synthesis (A New), of Special Relativity, *review* by Prof. H. S. Ruse, 906
Synthesis (Protein): Reticulocyte Enzymes and (Dr. Drummond Ellis, C. Elizabeth Sewell and L. G. Skinner), 190
  The Structure of Nucleic Acids and their Role in (Biochemical Society Symposium on), 602
Synthesis and Bleaching of Rhodopsin (Dr. George Wald and Paul K. Brown), 174
Synthetic Dyes and Pigments: The Chemistry of (edited by H. A. Lubs), *review* by Dr. S. Coffey, 498
Synthetic Growth Medium for the Trypanosomid Flagellate *Strigomonas* (*Herpetomonas*) *oncopelti* (B. A. Newton), 279
System for Virus Multiplication: Growth of Bovine Amniotic Ectoderm as a Cell Monolayer on Glass and its Use as a (T. W. F. Pay), 752
System (New), of Electrification for British Railways (G. H. Platt), 867
Szabó, Gy., and others: Free Amino-Acid Content of the Lymph, 1133
Szent-Gyorgyi, A.: Elected a Member of the National Academy of Sciences, Washington, 926
Szepesi, Z.: Semiconductors, 833

TABELING, R. W., and Fassel, V. A.: Spectroscopy, 737
Tables: Numerical, for Nuclear Physics (Charles Noël Martin), *review* by J. S. Story, 57
Tabor, Dr. H.: Use of Solar Energy, 111
Tachinid Larva: Site of Hibernation of a, within its Host (Prof. J. de Wilde and P. H. van Doesburg), 1087
Tagesrhythmik Explanation of Photoperiodism: Leaf Movements and the (Dr. M. Holdsworth), 845
Taha, Dr. E. D. M., and Sharabash, M. Mokhtar: Utilization of Xanthin by Mould Fungi, 622
Tail in Mouse Embryos: A Ventral Ectodermal Ridge of the (Prof. Hans Gruneberg), 787
Tainsh, H. R.: Awarded a moiety of the Lyell Fund for 1956 of the Geological Society of London, 165
Tales in Poetry: Polynesian, *review* by M. C. Burkitt, 1100
Talking about Communication, *review* by Prof. G. Patrick Meredith, 446
Tamas, Prof. L.: University Education in Hungary, 1072
Tana (Lake) Expedition: Into the Blue, the (Lionel Ferguson), *review* by R. W. Steel, 6
Taneja, G. C.: Adrenergic Sweating in Cattle, 482
Tanganyika: Rain-making in, 1204
Tanganyika (Lac): Exploration Hydrobiologique du, 1946–47 (Institut Royal des Sciences naturelle de Belgique, Résultats scientifiques, Vol. 4, Fasc. 2), 1025
Tanganyika (Lake): Phytoplankton of (Dr. Kathleen M. Drew), 520
Tanner, Dr. J. M.: Growth at Adolescence, *review* by Dr. J. S. Weiner, 860
Tannins: Vegetable (Society of Leather Trades' Chemists Symposium on), 215, 562, 879
Tape (Red): A History of—an Account of the Origin and Development of the Civil Service (Sir John Craig), *review* by R. B., 154
Tardi, Prof. P.: Elected a member of the Geography and Navigation Sections of the Paris Academy of Sciences, 918
Tarrant, L. H.: European Association of Exploration Geophysicists—Meeting in London, 120
Tarver, Dr. H. (Grodsky, Dr. G., and): Paper Chromatography of Insulin, 223
Taseer, Abdul Latif, and others: Emission of Photo Radiations by the Impact of Positive Ions of Helium on Nickel, 1226
Task: Teacher, Pupil and (edited by O. A. Oeser), *review*, 250
Tata, Dr. J. R.: Awarded a Junior Beit Memorial Fellowship for Medical Research, 966
Tata (Sir Dorab) Gold Medal of the Zoological Society of India awarded to Dr. M. L. Roonwal, 167
Tata Memorial Fund: Grants, Scholarships or Fellowships, for Research on Diseases of the Blood, with special reference to Leukæmia, 415, 1208
Taurobilirubin (Di- and Mono-), similar to a Directly Reacting Form of Bilirubin in Serum (Dr. M. Jirsa, B. Večerek and M. Ledvina), 895
Taxonomy (Plant): Immunological Methods in (P. G. H. Gell, S. T. C. Wright and Dr. J. G. Hawkes), 573
  An Introduction to (George H. M. Lawrence), *review* by Prof. T. G. Tutin, 546
  North-American, *review* by Prof. T. G. Tutin, 546
Taxonomy and Origins of Cultivated Bananas (N. W. Simmonds and K. Shepherd), 1111
Tayeau, F.: Chemistry of Oxygenated Heterocyclic Compounds, 1117
Taylor, B. W. (Magarvey, R. H., and): Shattering of Large Drops, 745

Taylor, Taylor and Hobson, Ltd., Leicester: Seventieth Anniversary of its founding, 834
Teacher, Pupil and Task (edited by O. A. Oeser), *review*, 250
Teachers: Nature Conservation for, *review* by Dr. Maurice Ashby, 678
Teachers (University): The Training of (S. Radcliffe), 217
Teaching (School): New Methods of, in Australia, *review*, 250
Teaching of Chemical Principles in School and University (British Association for the Advancement of Science, Sections B (Chemistry) and L (Education), Discussion on), 72
Teaching of Conservation and Resource-Use: Handbook for (prepared by the National Conservation Committee of the National Association of Biology Teachers in conjunction with the American Nature Association), *review* by Dr. Maurice Ashby, 678
Tebb, G., and Thoday, Dr. J. M.: Reversal of Mating Preference by Crossing Strains of *Drosophila melanogaster*, 707
Technical Assistance Programmes and their Support, 197
Technical Books: Recent Scientific and, Supp. viii, January 28; Supp. viii, February 25; Supp. vi, March 31; Supp. viii, April 28; Supp. viii, May 26; Supp. viii, June 30
Technical College, Bradford (Department of Chemistry and Dyeing), and others: Symposium and Exhibition on Radiochemistry, 167
Technical College Libraries in Great Britain, 509
Technical Colleges: Awards for Advanced Courses at, 607
Technical Co-operation Scheme of the Colombo Plan: Report for 1954–55, 197, 513
Technical Education, its Aims, Organisation and Future Development (Dr. P. F. R. Venables), *review* by Hugh A. Warren, 296
Technical Education: Developments in, *review* by Hugh A. Warren, 296
Technical Education—Shortage of Scientists, Technologists and Technicians (John Wellens), 967
Technical Education in Britain, 461, 591, 651
Technical Education in Great Britain (Dr. H. V. Lowry), 970
Technical Education (Higher), in Britain, 903
Technical Information Services in Europe (European Productivity Agency of the Organization for European Economic Co-operation Report on), 695
Technical Man-power: The Balance of Technological and, 675
Technical Societies of the United States and Canada: Scientific and (National Academy of Sciences—National Research Council), sixth edition, *review*, 549
Technical Students: Frederick D. Edwards Trust for Financial Help for, 1204
Technical and Economic Developments: World Energy Resources in the Light of Recent (Fifth World Power Conference), 692
Technicians: Laboratory (Report of a Sub-Committee of the Science Masters' Association), 270
  Technical Education—Shortage of Scientists, Technologists and (John Wellens), 967
Technicians (Animal): Ninth Annual Congress of (Laboratory Animals Bureau), 1198

Technique of Photography : Science and (Scientific and Technical Group of the Royal Photographic Society Conference on), 736
Technique for Recording Muscle Contractions in an Insect on a Kymograph (Dr. D. Dresden), 835
Techniques (Coupled), in Tracer Experiments : Electron Microscopy and Radioautography as (Dr J. Liquier-Milward), 619
Techniques (Newer), in Organic Analysis, *review* by Dr. G. M. Bennett, 546
Techniques and Applications of the Electron Microscope (Department of Engineering Physics of Cornell University Summer Laboratory Course on), 922
Technological Awakening (J. A. Oriel), 873
Technological Awards, National Council for, 920
Technological Education (Higher), London and Home Counties Regional Advisory Council for : Booklet on Advanced Courses in Technology, 364
  Seventh Annual Report, 691
Technological Humanism, 443
Technological and Technical Man-power : The Balance of, 675
Technologists : Future Numbers of University Students—the Desperate Need for (Lord Simon of Wythenshawe), 1214
Technologists in Britain . Statistics of Scientific Workers and, 828
  Supply of Scientists and, 873
Technologists and Technicians : Technical Education—Shortage of Scientists, (John Wellens), 967
Technology : Advanced Courses in (London and Home Counties Regional Advisory Council for Higher Technological Education, Booklet on), 364
  Courses and Awards in, 920
  Science and, in Defence, 635
Technology as a Branch of Education (Prof. C. W. Dannatt), 1015
Technology of Sound, *review* by Dr. H. D. Parbrook, 4
Technology in Western Germany : A Brief Review of Science and (K. H. Lauder), 316
Technology and Man-power Science, 51
Technology and the Universities (Prof. J. L. Montrose), 1016
Technology, College of (Bristol), in collaboration with the Regional Council for Further Education for the South West : Course on the Applications of Radioactive Isotopes in Industry and their Uses as Tracers, 1065
Technology (Advanced) : Colleges of, 1204
Technology (Chemical) : Encyclopedia of (edited by Raymond E. Kirk and Donald F. Othmer), Vol 11, Polyols to Rutin ; Vol. 12, Sabadine to Stilbestrol ; Vol. 13, Stilbite to Thermochemistry; Vol. 14, Thermodynamics to Waterproofing, *review* by Sir Alfred Egerton, 861
Teleost Fishes : The Leydig-cell Homologue in certain (Dr. A. J. Marshall and B. Lofts), 704
Telerecording : Suppressed Frame System of (C. B. B. Wood, A. V. Lord, E. R. Rout and R. F. Vigurs), 519
Telescope : A History of the (Dr. Henry C. King), *review* by Dr. H. E. Butler, 955
Television : Colour, *review* by G. R. Noakes, 497
  Visibility of Noise in (R. D. A. Maurice, M. Gilbert, G. F. Newell and J. G. Spencer), 519
Television (Colour) . An Introduction to (G. G. Gouriet), *review* by G. R. Noakes, 497
Television (Colour), in Britain : Future of (Sir Ian Jacob), 690
Television Microscope : The Flying-Spot Monochromatic Ultra-Violet (P. O'B. Montgomery, R. Roberts and W. Bonner), 1172
Television Transmitting Station at the Crystal Palace, London : New, 689
Television and Current Affairs : Broadcasting, 101
Television, Radar and Antennas Elsevier's Dictionary of, in Six Languages (compiled and arranged on an English alphabetical base by W. E. Clason), *review* by Dr. R. L. Smith-Rose, 1099
Temperature : Dependence of the Elastic Properties of Cadmium on (S. V. Subrahmanyam), 852
  Dependence of Snowfall on (L. W. Gold and G. P. Williams), 1137
  Influence of, on the Histological Evolution of the Ovotestis of *Cepea nemoralis* L. (J. Bouillon), 142
Temperature (Curie) : Changes in Lattice Constant of Cr_2O_3 near the (Selma Greenwald), 286
Temperature Effects in the Paper Partition Chromatography of Sugars (Margaret Alcock and J S. Cannell), 327
Temperature Factors (Anisotropic), in Cubic Crystals (Dame Kathleen Lonsdale and Dr. H. Judith Grenville-Wells), 986
Temperature Inversions by Twilight Scattering : Detection of Atmospheric Dust and (Dr. E. K. Bigg), 77
Temperature and Vapour Pressure or Dewpoint : Automatic Recording of (Dr. U. Berger-Landefeldt), 608
Temperatures (Arc) : Determination of, using Shock Waves (D. Whittaker and Dr. H Edels), 484
Temperatures (Different) : Variations in the Amount of Feulgen Stain in Nuclei of Plants Grown at (Dr. L. F. LaCour, Dr. E. M. Deeley and Dr. J. Chayen), 272
Temperatures (High), in Science and Industry : Methods, Materials and Processes involved in the Uses of (Stanford Research Institute and the University of California Symposium on), 693
Temperatures (Low) : Thermal Conductivity of Solid Argon at (Dr. G. K. White and Dr. S. B. Woods), 851
Temperley, H. N. V. · Research Students in the United States of America, 455
Tempest, W., and Parbrook, Dr. H. D. : Absorption of Ultrasound in Light Gases, 181
Temple Press, Ltd. . Farm Mechanization Scholarship (Institution of British Agricultural Engineers), 511
'Tenderness' in the Fleece : Influence of the Adrenal Cortex on Wool Growth and its relation to 'Break' and (H. R. Lindner and Dr. K. A. Ferguson), 188
Tennant, L. D. : Appointed veterinary officer, Uganda, 561
Tensile Strength of Liquid Helium II (Prof. A. D. Misener and G. R. Hébert), 946
Terminal Pigment Spots of the Starfish, *Asterias forbesi* : Role of the, in Light Orientation (Prof. M. Rockstein), 341
Termination of Chains in Vinyl Polymerization by Metal Salts (Dr. E. Collinson and Prof. F. S. Dainton), 1224
Terminological and General Language Review . Title changed to *Reading and Listening Linguistically*, 877
Terminology (Proposed), for Wool Follicles in Sheep (Dr. Margaret H. Hardy and A. G. Lyne), 705
Terrestrial Origin · Radio Noise of (Report of Commission 4 of the International Scientific Radio Union), 652
Tertiary Deposits (Australian) : Pollen Grains of the *Ephedra* Type in (Dr. Isabel C. Cookson), 47
Tertiary Times (Early) : Schizaeaceae of the South of England in (Marjorie E. J. Chandler), 463
Tester, S. J. : Scientific Humanism, 1212
Testicular Tissue : Effect of Cadmium Salts on (J. Parízek and Z. Záhor), 1036 ; (J. Parízek), 1036
Testing (Materials) : American Methods of, *review* by K. J. Pascoe, 248
Testing (Non-Destructive) : Physics of some New Aspects of (Non-Destructive Group of the Institute of Physics Summer Meeting on), 1113
Testing (Non-Destructive), of Materials and Structures : Proceedings of of the International Symposium on (International Union of Testing and Research Laboratories for Materials and Structures), 468
Testing and Inspection of Engineering Materials (Prof. Harmer E. Davis, Prof George Earl Troxell and Prof. Clement T. Wiskocil), second edition, *review* by K. J. Pascoe, 248
Testing and Research Laboratories for Materials and Structures, International Union of (RILEM) : Proceedings of the International Symposium on Non-Destructive Testing of Materials and Structures, 468
Testing Metals (with Special Reference to Optical Methods) : The Possible Uses of Surface Methods as a Means of (Non-Destructive Testing Group of the Institute of Physics Symposium on), 564
Testis (Mouse) : Sensitivity of the, to the Mutagenic Action of X-Rays (Dr. C. Auerbach and Dr. B. M. Slizynski), 376, 934 ; (Dr. A. J. Bateman), 934
Tetracyclines : Avidity of the, for the Cations of Metals (Prof. Adrien Albert and C. W. Rees), 433
Tetramethyl (Lead) : Absorption Spectra arising from the Photolysis of (Dr. C. L. Cook and G. Clouston), 1178
Tevis, jun., Lloyd : Additional Records of *Haplosporangium parvum* in Mammals in Britain, 437
Texas : Ecological Analysis of the Interbreeding of Crested Titmice in (Keith L. Dixon), 1213
Textile Industry : Rheological Research in the (British Society of Rheology Symposium on), 877, 1018
Textile Information—Uses and Needs (Textile Group of Aslib and the Textile Institute Conference on), 119
Textile Institute . Forty-first Annual Conference (New Yarns and Fabrics), 693
  Warner Memorial Medal awarded to Dr. J. M. Preston, 1113
Textile Institute (Manchester and District Section) : Discussion on the Properties and Distribution of Raw Cotton, 73
Textile Institute (Textile Group of Aslib and the) : Conference on Textile Information—Uses and Needs, 119
Thackwell, E. J. : Awarded the W. H. A. Robertson Medal (1955) of the Institute of Metals, 13
Thaler, George J., and Brown, Robert G. : Servomechanism Analysis, *review* by R. Neumann, 766
Theorem (A New), in Electrostatics and its Application to Calculable Standards of Capacitance (A. M. Thompson and Dr. D. G. Lampard), 888
Theoretical Chemistry : Summer School in (University of Oxford), 562
Theoretical Mechanics : Introduction to (Prof. Robert A. Becker), *review*, 352
Theoretical Physics : An Intelligent Man's Guide to, *review* by Prof. R. W. Ditchburn, 151
  Proceedings of the International Conference on, Kyoto and Tokyo, September 1953 (organized by the Science Council of Japan, with the collaboration of Kyoto University and the Physical Society of Japan), *review*, 1053
  Symposium at St. Andrews (Prof. J. F. Allen), 268
Theoretical Physics in the Australian National University, 116
Theoretical Statistics, *review* by Prof. M. G. Kendall, 813
Theoretical and Applied Mechanics, International Union of, and International Astronomical Union : I. A. U. Symposium Series, No. 2, Gas Dynamics of Cosmic Clouds—a Symposium held at Cambridge, July 6–11, 1953 (edited by H. C. van de Hulst and J. M. Burgers), *review* by Dr. F. D. Kahn, 352
Theory of Numbers : An Introduction to the (G. H. Hardy and E. M. Wright), third edition, *review*, 301
Theory of Ordinary Differential Equations (Prof. Earl A. Coddington and Prof. Norman Levinson), *review*, 722
Theory of Science : Kant's Metaphysics and (Prof. Gottfried Martin), translated from the German by P. G. Lucas, *review* by Prof. L. J. Russell, 152
Theory of Stereoscopic Transmission and its Application to the Motion Picture (Raymond and Nigel Spottiswoode), *review* by Prof. W. D. Wright, 202
Theory (Combustion) · Heat and Mass Transfer in, *review* by F. D. Robinson, 548
Theory (Electronic), of Valency : An Introduction to the (Dr. J. C. Speakman), third edition, *review* by G. Fowles, 909
Theory (Interruption), of Line Broadening : Phenomenological Considerations of the (Dr. Robert G. Breene, jun.), 922
Theory (Plastic), of Structures (Symposium at the University of Cambridge), 1208
Theory (Quantum) : Variational Principles in Dynamics and (Dr. Wolfgang Yourgrau and Stanley Madelstam), *review*, 1053
Theory and Practice of Aerial Photogrammetry (French National School for Geographical Sciences Course on), 831
Therapeutic Trials : Statistics of (Dr. G. Herdan), *review* by Prof. J. H. Gaddum, 1007
Therkelsen, Dr. A. J. : Awarded a Scholarship by the Lady Tata Memorial Fund, for research on leukæmia and allied diseases, 1208
Thermal Conductivity of Soil (John Webb), 989
Thermal Conductivity of Solid Argon at Low Temperatures (Dr. G. K. White and Dr. S. B. Woods), 851

Thermal Convection Patterns : Influence of a Magnetic Field on (W. C. Levengood), 631, *erratum*, 779
Thermal Diffusion : Separation of Hydrocarbon Isomers by (Dr. C. J. Danby, J. D Lambert and C. M. Mitchell), 1225
Thermal History of the Earth (Prof J. A Jacobs and D. W. Allan), 155
Thermionic Constants of Semi-conductors (Sir K. S. Krishnan and Dr. S. C. Jain), 285
Thermionic Valves, 1904–1954, the First Fifty Years (Institution of Electrical Engineers), *review* by R. L S.-R., 499
Thermodynamic Aspects of the Action of Phosphohexoseisomerase (F. Bruns and S Okada), 87
Thermodynamic Interpretation of the Eotvos Constant (Prof. Santi R Palit), 1180
Thermodynamics : General, *review* by R. W. Haywood, 1006
Thermodynamics from the Classic and Generalized Standpoints (Dr. Joseph Louis Finck), *review* by R. W. Haywood, 1006
Thermodynamics for Chemists and Chemical Engineers, *review*, 1145
Thermodynamics and Physics of Matter (edited by Frederick D. Rossini), *review* by Prof. L. Rosenhead, 400
Thermometers : Soil (Z. S. Garvitch and M C Probine), 1245
Thermonuclear Energy : Controlled (United Kingdom Atomic Energy Authority Symposium on), 1016
Thermoremanent Magnetism : Production of Self-Reversal of, by Heat Treatment of Ferromagnetic Minerals (Prof. T. Nagata and S. Uyeda), 179
Thewlis, Dr. J. : The Possible Uses of Surface Methods as a Means of Testing Metals (with Special Reference to Optical Methods), 564
Thickness of Ice Shelves : Determination of the, by Seismic Shooting Methods (G. de Q. Robin), 584
Thickness of Thin Films Measurement of the, by Multiple-Beam Interference (C. Weaver and P. Benjamin), 1030
Thin Films : Measurement of the Thickness of, by Multiple-Beam Interference (C Weaver and P. Benjamin), 1030
Thin Solid Films Optical Properties of (Dr. O. S. Heavens), *review*, 550
Thioctic Acid : Chemistry, Biochemistry and Pharmacology of (Symposium at the University of Naples), 75
Thiophene Rings : Compounds with Condensed (Howard B. Hartough and S L. Meisel), *review*, 403
Thiophosphoric Esters : Metal-catalysed Hydrolysis of (Prof. J. A. A. Ketelaar, H. R. Gersmann and Miss M M. Beck), 392
Thiourea . Irradiation of—Effect of Dose-rate upon the Chain Reaction (Dr. W. M Dale), 531
Thoday, Dr J. M (Lilly, Lorna J., and) : Effects of Cyanide on the Roots of *Vicia faba*, 338
Thoday, Dr. J M. (Tebb, G., and) . Reversal of Mating Preference by Crossing Strains of *Drosophila melanogaster*, 707
Thomas, Brinley : The Positive Contribution by Immigrants, 1164
Thomas, G. Mechanism of Phase Transformations in Metals, 419
Thomas, H. : Awarded a research grant by the Leverhulme Trustees, 918
Thomas, Dr H. Hamshaw : Farming History in Great Britain (Life and Writings of Richard Bradley), 171
  Elected president for 1956–57 of the Linnean Society of London, 1014
Thomas, P. Appointed cocoa soil survey officer, Gold Coast, 561
Thompson, A. M., and Lampard, Dr. D. G. : A New Theorem in Electrostatics and its Application to Calculable Standards of Capacitance, 888
Thompson, Prof. F C. . Chemical Composition of Parthian Coins, 23
  Welding of Aluminium and its Alloys, 568
Thompson, Dr. H. W. : Infra-Red Spectroscopy and Chemical Industry, 915
Thompson, J. B., and Rees, H. : Selection for Heterozygotes during Inbreeding, 385
Thompson, Dr. N.: Specialization in the Sixth Forms of Grammar Schools, 781
Thompson, Dr. W. B. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 220 ; work of, 220
Thompson Medal of the National Academy of Sciences, Washington, awarded to Prof. Alfred S. Romer, 924
Thomson, A. D. : Heat Treatment and Tissue Culture as a means of Freeing Potatoes from Virus Y, 709
Thomson, Dr David L. : Re-appointed a member of the National Research Council of Canada, 830
Thomson, Sir George The Foreseeable Future, *review* by R. Brightman, 3
Thomson, Dr J. . Appointed director of the British Scientific Instrument Research Association, 827 ; work of, 827
  Electronics, *review* by C. R. Stoner, 1192
Thomson, Sir Landsborough : Birds of Eastern and North-Eastern Africa, *review*, 203
  The Birds of the British Isles, *review*, 404
Thonemann, Dr P C. : Production and Utilization of Electromagnetically Enriched Isotopes, 157
  Promoted to Deputy Chief Scientific Officer in the Scientific Civil Service, 218 , work of, 218
Thorell, Prof. B. . Awarded a grant from the Lady Tata Memorial Fund, for research on leukæmia and allied diseases, 1208
Thornton, R. H. : *Rhizoctonia* in Natural Grassland Soils, 230
  Nutritional Aspects of *Mortierella hygrophila* Linn., 662
Thornton, R. H., and others : Mycelial Aggregation of Sand Soil under *Pinus radiata*, 231
Thorpe, Dr. W. H : Learning in Man and Animals, 1147
Thought : The Laws of (by George Boole) Celebration of the Centenary of (Proceedings of the Royal Irish Academy, Vol. 57, Section A, No. 6), 554
Thought (Contemporary) Psycho-Analysis and (British Psycho-Analytical Society's Lectures to commemorate the centenary of the birth of Sigmund Freud), 363
Thurso, Scotland . An Unusually Radioactive Fossil Fish from (S. H U. Bowie and D Atkin), 487
Thyro-parathyroidectomy . Influence of, on the Hæmatological Changes induced by Cortisone in the Rat (M. P. Brogi and Q. Maggiore), 138
Thyroid Activity . Effect of Sialoadenectomy on (Dr. Arthur W. Wase and Yu Sheng Louise Feng), 624
Thyroid and Thyrotrophic Hormones in the Blood of Rats at various Stages of the Œstrous Cycle : Levels of (Dr. Fouad A. Soliman and Helmy M. Badawi), 235
Thyrotrophic Hormones in the Blood of Rats at various Stages of the Œstrous Cycle Levels of Thyroid and (Dr. Fouad A. Soliman and Helmy M. Badawi), 235
Thyroxine : Destruction of, by Electrolytic Desalting (Dr. J. B. Jepson and Dr. I. Smith), 84
Tillotson, Ernest : Seismology, *review*, 57
  Obituary of Dr Ernst Wanner, 558
  European Seismological Commission—Meetings in Vienna, 1021
Timbers (Malayan) : Manual of (H. E. Desch), *review*, 1008
Time : The Arrow of (Prof. K R. Popper), 538
  Atomic and Astronomical (Dr. L. Essen and J. V. L. Parry), 744
  The Standard of Length and the Standard of (Dr Albert Pérard), 850
Time (Our) : Academic Freedom in (Prof. Robert M. MacIver), *review* by R. Brightman, 1190
Time is My Own My—an Irishman at the B.B.C. (John Irwin), 102
Time of Day : Spawning of the Sardine at a Definite (T. Gamulin and J. Hure), 193
Time-Resolved Spark Spectra : Spectrochemical Analysis with (Dr. Á. Bardócz and F. Varsányi), 222
Timmis, G. M : Antimetabolites and Cancer, *review*, 1007
Timmons, Dr. C. J , and others : Steric Effects in Anionotropic Rearrangements, 1167
Tinctorial Arts To-day (J. G. Evans), 1009
Tissue (Adult Mosquito) : Maintenance of, on a Tissue-Culture Medium (Dr. W. E. Beckel), 534
Tissue (Connective), and its Changes with Age (British Society for Research in Ageing Conference on), 467
Tissue (Muscular) Propagation of an Air-transmitted Shock Wave in (Carl-Johan Clemedson, Arne Jonsson and Hjalmar Pettersson), 380
Tissue (Plant) : Initial Absorption of Ions by (Dr. A B. Hope and Dr. R. N. Robertson), 43
Tissue Culture : Heat Treatment and, as a means of Freeing Potatoes from Virus Y (A. D. Thomson), 709
  Plant and Animal, *review* by Prof. R J. Gautheret, 719
Tissue-Culture Medium Maintenance of Adult Mosquito Tissue in a (Dr. W. E. Beckel), 534
Tissue Oxygenation (Peripheral) : Simultaneous Recording of Inspired Oxygen Concentration and (Dr. R. H. Kay and Dr. R. V. Coxon), 45
Titanium Alloy (Alpha-Beta) : Metallographic Evidence of Mechanical Twinning in an (Dr D. N Williams), 436
Titles of Papers in Review Articles : Quotation of (Dr. Charity Waymouth), 98 ; (N. W. Pirie), 440 ; (Dr. Kenneth M. Smith), 464
Titmice (Crested), in Texas . Ecological Analysis of the Interbreeding of (Keith L. Dixon), 1213
Titrations (Antigen-Antibody), in Gels : A New Quantitative Method for (Dr. Joseph G. Feinberg), 530
Tizard, Sir Henry Government Responsibility in Industrial Research, 171
Tobacco (Maryland Mammoth) . A New Unidentified Indole Hormone in (A. J. Vlitos, Werner Meudt and R. Beimler), 890
Tobacco Mosaic Virus : Infectivity of Ribonucleic Acid from (Dr. A. Gierer and Prof. G. Schramm), 702
  Mechanism of Inactivation of, by X-rays (Max A. Lauffer, David Trkula and Anne Buzzell), 890
  Reactivation of Partially Degraded (Roger G. Hart), 130
  Reversible, Host-induced, Changes in a Strain of (F. C. Bawden), 302
  Structure of—Radial Density Distribution in the Tobacco Mosaic Virus Particle (Dr. D. L. D. Caspar), 928 ; Location of the Ribonucleic Acid in the Tobacco Mosaic Virus Particle (Dr. Rosalind E. Franklin), 928
Tobermorite : Crystal Structure of (Dr. H. D Megaw and C. H Kelsey), 390
Tobolsky, Arthur V., and Mesrobian, Robert B. . Organic Peroxides, *review* by Dr G. M. Bennett, 814
γ-Tocopherol (7-Methyltocol), a New Tocopherol in Rice (J. Green and S. Marcinkiewicz), 86
Tocopherol Content of Heart-muscle Preparations (J. Bouman and Prof. E. C Slater), 1181
Todd, Sir Alexander : Recent Advances in the Chemistry of Colouring Matters, 647
  The Development of Organic Chemistry since Perkin's Discovery, 1009
Todd, Sir Alexander, and others : Hydrolysis of Esters of Monoribonucleotides, 1124
Toennies, Dr. G., and Kolb, J. J. : Separation of Unstable Oxidation Intermediates of Cysteine, 281
Toennies, Dr. G. (Stegemann, Dr. H., and) : A Rapid Variable-Temperature Micro- or Macro-Dialyser, 440
Toft, H. B. : Elected to the board of directors of A. Gallenkamp and Co., Ltd., 17
Tolansky, Prof. S. : The Possible Uses of Surface Methods as a Means of Testing Metals (with Special Reference to Optical Methods), 564
  An Introduction to Interferometry, *review* by Prof. H. Lipson, 864
  The Microstructures of Diamond Surfaces, *review* by Dr. J. W. Mitchell, 1193
Tolerant of each others' Antigens : Attempts at Hybridization of Chickens and Turkeys which are (Margaret Ryle and M. Simonsen), 437
Tombs, Dr N C. : Some Recent Developments in Magnetism, 518
Tomkeieff, Dr. S. I.: *Obituary* of Prof P N. Chirvinsky, 259
Tomkins, F. S , and Fred, M. : Spectroscopy, 737
Tomlinson, A. J. H , and Parker, M T : Production of Opacity on Serum Agar Plates by some Strains of *Staphylococcus aureus*, 895
Tomlinson, T. B., and others : Electroluminescence in Disordered Zinc Sulphide, 240
Tomorrow : Citizens of—a Study of the Influences affecting the Upbringing of Young People (King George's Jubilee Trust), 149
Tonometer : A Simple (Rev. A. M. Jones), 242
Tootal Broadhurst Lee Co., Ltd. . Gift of £500 a year for two years to the Department of Inorganic and Structural Chemistry in the University of Leeds, for research on nuclear magnetic resonance, 463
Tooth Dentine of *Macropus* : Crystallite Orientation in the (Dr. D. F. G. Poole), 485
Toovey, F. W. : Appointed director of the Glasshouse Crops Research Institute, 212 ; work of, 212
Topping, Dr. J. : Teaching of Atomic and Nuclear Physics, 780
Tornudd, Miss Elin : Documentation of Applied Chemistry, 169
Torto, J. O. : Appointed deputy director of agriculture, Gold Coast, 831

Totton, A. K., and Mackie, G. O. : Dimorphism in the Portuguese Man-of-War, 290
Townes, Prof. C. H. : Elected a Member of the National Academy of Sciences, Washington, 926
Townes, Prof. C. H., and Schawlow, A. L. : Microwave Spectroscopy, *review* by Dr. D. M. S Bagguley, 1099
Townsend Ionization Coefficient for Hydrogen : The First (D. J. Rose, D. J. De Bitetto and L. H. Fisher), 945
Toxæmia of Late Pregnancy in Sheep Prevention of (H. B. Parry), 288
Toxins (Diphtheria) : Tests of Purity of, by Electrophoresis in Starch Gel (M. D. Poulik), 982
Trace Amounts of Cations on Anion Exchange Resins : Adsorption of, by the Formation of Insoluble Salts (R. H. James and G. A. Welch), 183
Tracer Experiments : Electron Microscopy and Radioautography as Coupled Techniques in (Dr. J. Liquier-Milward), 619
Tracer Techniques : Radioactive, in Biology, *review* by Dr. E. H. Belcher, 638
Tracers : The Applications of Radioactive Isotopes in Industry and their Uses as (College of Technology, Bristol, in collaboration with the Regional Council for Further Education for the South West, Course on), 1065
Tracey, M. W. Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 165
Trade Unionism : British (Five Studies by P E P), new edition, *review*, 642
Training of University Teachers (S. Radcliffe), 217
Transfer of Hydrogen from Alcohols to Quinones (Dr. C. F Wells), 483
Transfer Scholarships (Imperial Chemical Industries, Ltd), 606
Transformations (Phase), in Metals : Mechanism of (Metal Physics Committee of the Institute of Metals Symposium on), 419
Transistor Audio Amplifiers (Richard F. Shea), *review* by D. D. Jones, 864
Transistors (Abraham Coblenz and Harry L. Owens), *review* by J. R. T., 301
Transition (Reversible First-Order Phase), in Collagen-Diluent Mixtures : Evidence for a (R R. Garrett and Prof. P. J. Flory), 176
Translators, International Federation of : Publication of *Babel*, an International Journal of Translation, 313
Transmission of the Potato Leaf-roll Virus by Aphids (M. F. Day), 967
Transmission (Stereoscopic) : The Theory of, and its Application to the Motion Picture (Raymond and Nigel Spottiswoode), *review* by Prof. W. D. Wright, 202
16 kc./s. Transmissions from *GBR* Rugby : Frequency Variations in New Zealand of (A. H. Allan, D. D. Crombie and W. A Penton), 178
Transport of Sea Water Cations across the Ectoderm of *Fundulus heteroclitus* : Factors influencing the (D. R. Shanklin), 431
Transport (Active), of Sodium in the Isolated, Short-circuited Frog Skin : Oxygen Consumption and (Dr. K. Zerahn), 937
Transport (Road) : Human Factors in (Ergonomics Research Society Symposium on), 314
Transport and Civil Aviation, Minister of : Appointment of a Committee of Inquiry into the Inland Waterways in Britain, 312
Tranter, Dr. T. C. : Crystal Structure of Glycyl-L-Alanine Hydrochloride, 37
Trask, Dr. Parker D. : The *Atlantis* Marine Geological Expedition to Peru and Chile, 454
Travelling Fellowships : Mond Nickel, 877
Travelling Fellowships in Medicine : Lederle (Medical Research Council), 215
    Eli Lilly (Medical Research Council), 215
    Rockefeller (Medical Research Council), 215
Treatment with Lime : A Dietary Defect in Maize developed during (P. L. Pellett and Prof B. S. Platt), 422
Trechmann, Dr C. T. : Awarded the R H. Worth Prize for 1956 of the Geological Society of London, 1065
Tredgold, Dr. R. H. : Appointed lecturer in physics at the University of Sheffield, 415
Trees : Some Beautiful Indian (Ethelbert Blatter and Walter Samuel Millard), second edition, revised by William T. Stearn, *review* by N. L. Bor, 680
    'Yaku-sugi', 569
Trees (Rubber) · Stimulation of Yield from (E. D. C. Baptist and P. de Jonge), 1073
Tremor produced by Drugs (Dr. Guy M. Everett), 1238
Trendall, Prof A. D. : Appointed a member of the Advisory Council of the Commonwealth Scientific and Industrial Research Organization, 734
Trewavas, Dr E. : *Obituary* of Prof. Léon Bertin, 686
Trials (Therapeutic) : Statistics of (Dr. G. Herdan), *review* by Prof. J. H. Gaddum, 1007
Trichobilharziasis : Nasal—a New Avian Schistosomiasis (Dr. A. Fain), 389
Trichophyton mentagrophytes : Separation of Epidermis from Dermis by Filtrates of (Dr. C. N. D. Cruickshank and M. D. Trotter), 1085
Trichosiderin The Pigment, from Human Red Hair (Dr. N. A. Barnicot), 528
Trickett, W. H. · Appointed lecturer in statistics at the University of Leeds, 1017
Trihydrate (Alumina) : A New (Robert A. Van Nordstrand, William P. Hettinger and Carl D. Keith), 713
Trinity College, Dublin : Reconstructed Iveagh Geological Laboratory to be opened by the Earl of Iveagh, 736
    The Iveagh Geological Laboratory of (Prof. W. D. Gill), 1056
Trinuclear Molecules in the Crystal Structure of Bisacetylacetonenickel (II) (Dr. G. J. Bullen), 537
Triple and Quadruple Cones in the Retina of the Minnow (*Phoxinus laevis*) : Occurrence of (Miss A. H. Lyall), 1086
Tripping, Crossing and Selfing in Lucerne Strains (A. Zaleski), 334
Tritium-labelled Dihydrostreptomycin : Preparation of (Dr. Torsten André), 379
Trkula, David, and others · Mechanism of Inactivation of Tobacco Mosaic Virus by X-rays, 890
Trombe, Felix . Use of Solar Energy, 112
Tropical Hygiene for Layman (Ross Institute Course on), 922
Tropical Medicine and Hygiene, Royal Society of : Manson Medal for 1956 awarded to Brigadier J. A. Sinton, 562
Tropical Regions (Humid) : Scientific Problems of, 463
Tropical Vegetation : International Symposium on the Study of (Unesco), 463
Tropics (Humid) . Research on the—the Unesco Programme (Prof. P. W. Richards), 1010
Trost, P. A., and others : Cosmic-Ray Increase observed at High Southern Latitudes on February 23, 1956, 1173
Trotman-Dickenson, A. F : Gas Kinetics, *review* by Dr. K. E Howlett, 864
Trotter, Dr. F. M. : Awarded the Murchison Medal for 1956 of the Geological Society of London, 165
Trotter, M. D. (Cruickshank, Dr. C. N. D., and) : Separation of Epidermis from Dermis by Filtrates of *Trichophyton mentagrophytes*, 1085
Troxell, Prof George Earl, and others : The Testing and Inspection of Engineering Materials, second edition, *review* by K. J. Pascoe, 248
Trueman, Sir Arthur *Obituary* by Prof. Leslie R. Moore, 308
Truter, Dr. E. V. : Appointed lecturer in textile chemistry at the University of Leeds, 463
Truxal, Prof. John G. Automatic Feedback Control System Synthesis, *review* by Prof. A. Tustin, 106
Trypanosoma vivax : Effect of Antibody on the Respiratory Rate of (Dr. R. S. Desowitz), 132
Trypanosoma vivax, *T. congolense* and *T. brucei* : Responses of Domestic Animals to Infections of (Prof. E. E. Edwards, J M. Judd and F. A. Squire), 332
Trypanosomiasis (Animal) : Prophylactic Activity of Suramin Complexes in (Dr. J. Williamson and Dr. R. S. Desowitz), 1074
Trypanosomid Flagellate *Strigomonas* (*Herpetomonas*) *oncopelti* . A Synthetic Growth Medium for the (B. A. Newton), 279
Trypsin and Alpha-Chymotrypsin : Effect of Urea on (Dr. J. Ieuan Harris), 471
Tryptic Hydrolysates of Milk Products : New Amino-Acid—Glycosides isolated from (Susumu Adachi), 936
Tsetse Fly and Trypanosomiasis Research Committee : Report for 1954–55, 365, 416
Tsien, H. S. : Engineering Cybernetics, *review* by Dr. Colin Cherry, 351
Tsujikawa, I. : Low-Temperature Crystallography, 1069
Tubal Mouse Ova . Culture of (W. K. Whitten), 96
Tuber-bearing Species of *Solanum* (J. G. Hawkes), 927
Tubercle Bacillus Residues : Experimental Allergic Encephalomyelitis produced by (J. Colover and Dr. R. Consden), 749
Tuberculosis : Dorothy Temple Cross Research Fellowships in (Medical Research Council), 215
    Experimental—Bacillus and Host, with an Addendum on Leprosy (edited by G E. W. Wolstenholme and Margaret P. Cameron), *review* by Dr. Derek Hobson, 448
Tuberculosis and Leprosy Research on, *review* by Dr. Derek Hobson, 448
Tubes (Branched) . Flow of Viscous Liquids in, with reference to the Hepatic Portal Vein (Dr. C. H. Barnett and Dr. W. Cochrane), 740
Tuck, D. G : Bombardment of Glass by Alpha-Particles, 434
Tuffery, A. A. : Infections in Laboratory Animals, 1198
Tumour Cells (Normal and Homologous) : Differences between the Electrical Charge carried by (Dr. E. J. Ambrose, A. M. James and J. H. B. Lowick), 576
Tumour Growth-inhibitory Alkyl Sulphonates (Prof. A. Haddow and Dr. W. C. J. Ross), 995
Tumours (Mouse Ascites) : Nucleic Acid Content and Distribution of Chromosome Number in Original and Sublines of Two (Dr. John S. Colter, Harris H. Bird, Hilary Koprowski and Hilda B. Ritter), 993
Tunbridge, Prof. R. E. : Connective Tissue and its Changes with Age, 467
Tungsten : Adsorption Spectrum of Nitrogen on (Dr. Gert Ehrlich and Dr. T. W. Hickmott), 1045
Tungsten (Chromium, Vanadium and) · Determination of, by Activation Analysis using Low-Level Neutron Sources (Prof. M. Huaringa), 85
Turbidimetric and Nephelometric Methods : Colorimetric Methods of Analysis, including some (Dr. Foster Dee Snell and Dr. Cornelia T. Snell), Vol. 3, Organic (1) ; Vol. 4, Organic (2), *review* by J. King, 201
Turbulence in the Atmosphere (Royal Meteorological Society Symposium on), 13
Turbulence above the Ozone Layer (Alan E. Slater), 1207
Turkeys : Attempts at Hybridization of Chickens and, which are Tolerant of each other's Antigens (Margaret Ryle and M. Simonsen), 437
    A Virus in Chronic Respiratory Disease of (J. A Fahey), 90
Turnbull, D. : Mechanism of Phase Transformations in Metals, 419
Turner, Dr. A. J. : Retirement as director of research of the Linen Industry Research Association, 460 ; work of, 460
Turner, Dr. A. N. (King, F , and) : Given a Capper Pass Award by the Institution of Mining and Metallurgy and the Institute of Metals, 68
Turner, A. W. (Crane, C W., and) : Amino-Acid Patterns of Urine and Blood Plasma in a Cystinuric Labrador Dog, 237
Turner, Prof. F. J. : Elected a Member of the National Academy of Sciences, Washington, 926
Turner, Prof. J. S. · Cloud Physics, 320
    Appointed a member of the Advisory Council of the Commonwealth Scientific and Industrial Research Organization, 734
Turner, Prof. J. S , and others : Phosphorylation as a Possible Factor in the Pasteur Effect in Plants, 333
Turnips : A Virus Latent in (J. P. MacKinnon), 1157
Turvey, Dr. J R. : Preparing Enzymes, *review*, 810
Tustin, Prof. A. : Automatic Feedback Control, *review*, 106
Tutin, Prof. T. G. : North-American Plant Taxonomy, *review*, 546
    Progress in the Study of the British Flora, 1162
Twilight Scattering : Detection of Atmospheric Dust and Temperature Inversions by (Dr. E. K. Bigg), 77
Twinning (Mechanical), in an Alpha-Beta Titanium Alloy : Metallographic Evidence of (Dr D. N. Williams), 436
Twiss, R. Q (Brown, R. Hanbury, and) : Correlation between Photons in Two Coherent Beams of Light, 27
Two Ears of Corn, Two Blades of Grass (D. H. Killeffer), *review* by Dr. R. E. Slade, 298
200 Miles Up, the Conquest of the Upper Air (J. Gordon Vaeth), second edition, *review* by G. R Noakes, 862
Two-Dimensional Electrophoresis of Serum Proteins (Dr. O. Smithies and M. D. Poulik), 1033
Two-Dimensional Zone Electrophoresis applied to Mucoproteins in Serum and Urine : A Modified Method of (R. L. Markham), 125

Two-sided Laplace Integral : Operational Calculus based on the (Dr. Balth van der Pol and Dr. H. Bremmer), second edition, *review* by Prof. L. M. Milne-Thomson, 954

Twomey, Dr. S., and others : Measurements of Natural Freezing Nuclei at High Altitudes, 82

Tye, W. : Awarded the Branch Prize of the Royal Aeronautical Society, 919

Tyler, Prof. Cyril : Farming History in Great Britain (Historical Development of Feeding Standards for Livestock), 171

Tymms, Pamela (Flewett, T. H., and) : Use of Gold Sols as an Aid to Focusing in High-Resolution Electron Microscopy, 98

Tympanal Organs (Lepidopterous) : Electrical Responses of certain (Dr. P. T. Haskell and P. Belton), 139

Type (A New), of Electron Multiplier : The Gas-Multiplier (C. H. Vincent), 391, *erratum*, 415

Type Specimens of Microlepidoptera in the British Museum (Natural History) described by Edward Meyrick : Catalogue of the (J. F. Gates Clarke), *review* by Dr. G. C. Varley, 1005

Tyrosine : Conversion of Phenylalanine into, in the Silkworm Larva (*Bombyx mori*), (T. Fukuda), 429

Tyrosine Metabolism : A Requirement for Catalase in—the Oxidation of *p*-Hydroxyphenylpyruvic Acid to Homogentisic Acid (Dr. Bert N. La Du and Vincent G. Zannoni), 574

Tyrrell, H. J. V., and others: the 'Seebeck Effect' in a Purely Ionic System, 668

Tyte, Dr. L. C. : Mining Research Establishment, Isleworth, of the National Coal Board, 958

UBBELOHDE, Prof. A. R : Crystallography and the Phase Rule, 123
  The Place of Science and the Humanities in Education, 960

Udder (Cow's) : A Radiographic Method for the Study of the Function of the (Dr. J. Bilek and Dr. M. Janovsky), 582

Uffen, R. J. : Melting, Diffusion and related topics, 23

Ulisse : Offer of the Cortina-Ulisse European Prize for 1956, 119

Ultrasonic Relaxation in Unsaturated Aldehydes (M. S. de Groot and John Lamb), 1231

Ultrasonic Studies : Viscosity of Liquids and (Prof. A. K. Dutta, B. C. Ray and H. K. Rout), 1227

Ultrasound in Engineering and Science : Sonics—Techniques for the Use of Sound and (Theodor F. Hueter and Prof. Richard H. Bolt), *review* by Dr. H. D. Parbrook, 4

Ultrasound in Light Gases : Absorption of (W. Tempest and Dr. H. D. Parbrook), 181

Ultra-Violet Absorption of Oxygen in Organic Solvents (Allan U. Munck and Dr. Jesse F. Scott), 587

Ultra-Violet Bands (The Near), of *para*-Dichlorobenzene (Prof. R. K. Asundi and B. D. Joshi), 36

Ultra-Violet Television Microscope : The Flying-Spot Monochromatic (P. O'B. Montgomery, F. Roberts and W. Bonner), 1172

Undergraduate Course in Nuclear Engineering (University of Glasgow), 508

Underwater Hydrodynamic Research Laboratories : New (F. S. Burt), 108

Undersea Warfare : A Survey Report on Human Factors in (prepared by the Panel on Psychology and Physiology of the United States National Research Council Committee on Undersea Warfare), *review* by Sir Frederic Bartlett, 105

Unesco : Research on the Humid Tropics—the Unesco Programme (Prof. P. W. Richards), 1010
  Appointment of Raymund L. Zwemer as head of the Division of International Co-operation for Scientific Research in the Natural Science Department, 263
  International Symposium on the Study of Tropical Vegetation, 463
  Symposium on the Positive Contribution by Immigrants (prepared by the International Sociological Association and the International Economic Association), 1164

Unesco and its Programme, No 11, 397

Unesco, and others : International Survey of Programmes of Social Development, 421

Unesco Centre for Scientific Co-operation : Second General Catalogue of Latin America Mycological Collections, 921

Unesco Institute of Education, Hamburg : Publication of the *International Review of Education*, 372

Ungley, Dr. C. C. : Diet and Anæmia, 879

Unidentified Amino-sugar present in Cell Walls and Spores of various Bacteria (R. E. Strange and F. A. Dark), 186

Unidentified (A New), Indole Hormone in Maryland Mammoth Tobacco (A. J. Vlitos, Werner Meudt and R. Beimler), 890

Union University (Albany Medical College of), U.S.A. : Grant of 500,000 dollars from the Commonwealth Fund, New York, for medical education, 1064

United Kingdom in Ottawa, High Commissioner for the : Appointment of G. H. C. Amos as agricultural and food adviser to the, 736

United Kingdom Atomic Energy Authority : Staffing the, 16
  Two new Research Reactors, 165
  To withdraw from the Wairakei Heavy-Water Scheme, 213
  Opening of the Calder Hall Power Station, 1016
  Symposium on Controlled Thermonuclear Energy, 1016

United Kingdom Atomic Energy Authority and its Functions (Sir John Cockcroft), 204

United Kingdom Power Development : The Place of Nuclear Energy in (V. A. Pask and J. C. Duckworth), 204

United Kingdom and Colonial Territories : Fifth Annual Report (1949–1954) of the Fulbright Program in the, 566

United Nations : Proceedings of the International Conference on the Peaceful Uses of Atomic Energy, held in Geneva, 1955, Vol. 2, Physics, Research Reactors ; Vol. 3, Power Reactors ; Vol. 14, General Aspects of the Use of Radioactive Isotopes, Dosimetry, 1102
  Yearbook of the, 1954, *review*, 1053

United Nations Food and Agriculture Organization : Appointment of Joseph L. Orr to be the FAO liaison officer at the United Nations Headquarters, 70
  Appointment of Harold L. Vogel as representative of the Director-General in North America, 70
  Appointment of Adolfo Alarcón as regional officer for Mexico, Central America and the Caribbean, 70

United Nations Food and Agriculture Organization, and others : International Survey of Programmes of Social Development, 421

United Nations Secretariat (Bureau of Social Affairs), and others : International Survey of Programmes of Social Development, 421

United States : The Development of Academic Freedom in the (Prof. Richard Hofstadter and Walter P. Metzger), *review* by R. Brightman, 1190
  Electrical Supply Systems in the, *review* by G. H. Platt, 297
  Food Problems in the, *review* by Sir John Russell, 349
  Grants for Medical Education in the (Commonwealth Fund, New York), 1064
  High-Energy Particle Accelerators in the, 470
  Higher Education in the, 1158
  Fourth National Clay Conference in the (Dr. D. M. C. MacEwan), 368
  Optics Meetings in the, 263
  Red Fox in the, 1073
  Research Reactors in the, *review* by Sir John Cockcroft, 593
  Science in the, during 1954, 76
  Wild-Life Refuges in the, *review* by E. M. Nicholson, 765

United States of America : Research Students in the (H. N. V. Temperley), 455

United States Atomic Energy Commission : Symposium on Genetic Recombination, given at the Research Conference for Biology and Medicine at Oak Ridge, Tennessee, April 1954, *review* by Prof. G. W. Beadle, 595

United States Atomic Energy Commission (prepared by the) : Research Reactors, *review* by Sir John Cockcroft, 593
  Neutron Cross-Sections, *review* by Dr. P. A. Egelstaff, 812

United States Educational Commission in the United Kingdom : Fifth Annual Report of the Fulbright Program in the United Kingdom and Colonial Territories (1949–1954), 566

United States Geological Survey : Professional Paper No. 260, Natural History of Coral Atolls, 607
  Bulletin 99, Annotated Bibliography of the Bauxite Deposits of the World (Elizabeth C. Fischer), 656

United States National Committee for the Development of Scientists and Engineers, 734

United States National Museum : Annual Report for 1955, 921

United States Office of Naval Research, and others : Symposium on Perspectives in Marine Biology, 70, 1212

United States and Canada : Scientific and Technical Societies of the (National Academy of Sciences—National Research Council), sixth edition, *review*, 549

United States, Germany and France . New Developments in Industrial Leadership in Great Britain, the (edited by Frank A. Heller), 1001

Universe in the Physics of the Seventeenth and Eighteenth Centuries . Evolution of a Scientific View of the (B. G. Kuznetsov), (in Russian), *review* by Dr. R. Eisenschitz, 1194

Universities : Technology and the (Prof. J. L. Montrose), 1016

Universities in Australia : The Place of, 1071

Universities of Great Britain and Northern Ireland : Conference on the Age-Group Bulge and its Possible Effect on University Policy, 115

Universities (American) . Freedom in, *review* by R. Brightman, 1190

Universities (Australian) : The Place of the Australian University in the Community and Post-Graduate Studies in the (Australian Vice-Chancellors' Committee Symposium on), 1071

Universities (British) . Scientific Research in, 1954–55 (Department of Scientific and Industrial Research), 828

Universities (British), through American Eyes, *review* by Prof. W. H. G. Armytage, 1005

Universities (British), in the 1960's : Population of—The Age-Group Bulge (Prof. R. G. D. Allen), 115

University : The Teaching of Chemical Principles in School and (British Association for the Advancement of Science, Sections B (Chemistry) and L (Education), Discussion on), 72

University of Adelaide : Retirement of Prof. J. A. Prescott from the directorship of the Waite Agricultural Research Institute, 689
  Appointment of Dr. James Melville as director of the Waite Agricultural Research Institute, 689

University of Aix-Marseille : Grant of 25,000 dollars from the Rockefeller Foundation, New York, for research at the Institute of Biological Chemistry, 976

University of Birmingham : Huxley Lecture for 1956 (Dr. Harry Godwin, The Quaternary History of the British Flora), 215
  Sir Josiah Mason Lectures (Prof. Max Gluckman, Conflict and Cohesion in Zululand), 215
  Appointment of J. A. Gascoigne and Miss M. Ramsay as British Rayon Research Association Research Fellows in chemistry, 215
  Appointment of Dr. H. Weiss as British Council Research Fellow in chemistry, 215
  Appointment of Nadim A. Ghanem as a Research Fellow in chemistry, 215
  Appointment of Prof. E. C. Rollason to the chair of industrial metallurgy, 605
  Appointment of D. B. Holt as a Research Fellow in physical metallurgy, 693
  Appointment of Dr. G. Hubscher as a Research Fellow in pharmacology, 693
  Gift from Ciba, Ltd., Basle, of £700 a year for three years for a Ciba Research scholarship in the techniques of organic chemistry, 693
  Grant of £900 from the Electrical Research Association to the Department of Electrical Engineering, for the continuation of research work on electric discharges in liquids, 693
  Appointment of Dr. N. A. Dudley as reader in engineering production and head of the Department of Engineering Production, 876
  Appointment of T. K. Chaplin as lecturer in civil engineering, 876
  Appointment of Dr. T. B. Massalski as lecturer in physical metallurgy, 876
  Appointment of R. B. Hoole as lecturer in mining, 876
  Appointment of Dr. J. N. Hawthorne as lecturer in pharmacology, 876
  Appointment of D. W. Wright (of the National Vegetable Research Station) as a recognized lecturer attached to the Department of Zoology, 876

Appointment of Dr. W. G. Keyworth (of the National Vegetable Research Station), as a recognized lecturer attached to the Department of Botany, 876
Summer Course on Oilfield Reservoir Engineering, 1065
Appointment of Prof. M. Stacey to the Mason chair of chemistry, 1156
University of Birmingham (Colonial Office and the) . Contract for the geological work of the Falkland Islands Dependencies Scientific Bureau to be done in the Department of Geology at Birmingham, 1110
University of Bristol : Annual Report (1954) of the Agricultural and Horticultural Research Station (the National Fruit and Cider Institute), Long Ashton, 322
University of Bristol (Colston Research Society and the) · International Symposium on the Neurohypophysis, 561, 1019
University of Calcutta : Appointment of Dr. J. L. Bhaduri to the Sir Nil Ratan Sircar professorship and head of the Department of Zoology, 776
University of California, and others : Symposium on Perspectives in Marine Biology, 70, 1212
University of California (Stanford Research Institute and the) : Symposium on Methods, Materials and Processes involved in the Uses of High Temperatures in Science and Industry, 693
University of Cambridge : Summer School in the Mathematical Laboratory in Programme Design for Automatic Digital Computing Machines, 922
Gift of two grants of 4,250 dollars each from the Ford Foundation, to assist the work of Prof. M. Fortes and of E. R. Leach, 968
Symposium on the Plastic Theory of Structures, 1208
University of Cape Town : Retirement of Prof. M. R. Drennan from the chair of anatomy, 873
Appointment of Dr. L. H. Wells to the chair of anatomy, 873
University of Chicago : Grant of 50,000 dollars from the Rockefeller Foundation, New York, for its programme of training in statistics for scientists, 976
Grant of 10,500 dollars from the Rockefeller Foundation, New York, for research work in experimental ecology, 977
University of Colorado : Grant of 85,000 dollars from the Rockefeller Foundation, New York, for a biophysics research programme, 976
University of Copenhagen : Grant of 14,000 dollars from the Rockefeller Foundation, New York, for research in physiology, 977
University of Dublin : Reconstructed Iveagh Geological Laboratory in Trinity College to be opened by the Earl of Iveagh, 736
The Iveagh Geological Laboratory, Trinity College (Prof. W. D. Gill), 1056
University of Durham · Endowment of a new chair of marine engineering at King's College, Newcastle-upon-Tyne, 212
Appointment of Dr. S. K. Runcorn as professor of physics in King's College, Newcastle-upon-Tyne, 411
Appointment of Dr. W. B. Fisher as professor of geography in the Durham Division, 1110
Appointment of Dr. P. L. Robinson to a personal professorship of inorganic chemistry in the Newcastle Division, 1110
Appointment of Dr. E. G. Richardson to a personal professorship of acoustics in the Newcastle Division, 1110
Appointment of Dr. J. Weiss to a personal professorship of radiation chemistry in the Newcastle Division, 1110
University of Exeter : Conference on Geological and Geomorphological Research in the South-West of England, 166
Appointment of Dr. G. K. T. Conn as professor of physics, 1062
University of Florence : Grant of 9,000 dollars from the Rockefeller Foundation, New York, for research in the Institute of Botany, 977
University of Glasgow : Undergraduate Course in Nuclear Engineering, 508
Appointment of Prof. I. N. Sneddon to the Simson chair of mathematics, 1109
University of Hull : Election of Prof. Brynmor Jones as Vice-Chancellor, 116
Appointment of Dr. Norman B. Chapman to the G. F. Grant chair of chemistry, 1203
University of Leeds : Gift of £2,500 from Boots Pure Drug Co., Ltd., to the Building Fund of the Chemistry and Physics Extension, 463
Gift of £500 a year for two years from Tootal Broadhurst Lee Co , Ltd., to the Department of Inorganic and Structural Chemistry, for research on nuclear magnetic resonance, 463
Gift of £700 from BP Trading, Ltd., to the Department of Physical Chemistry, for research, 463
Gift of £3,500 from the British Coke Research Association to the Department of Coal Gas and Fuel Industries, to support research on the disposal of effluents, 463
Appointment of Dr. P. Grosberg as lecturer in textile engineering, 463
Appointment of Dr. E. V. Truter as lecturer in textile chemistry, 463
Report to the Worshipful Company of Clothworkers of the City of London of the Advisory Committee on the Departments of Textile Industries and Colour Chemistry and Dyeing, for the Session 1953–54, 469
Appointment of Dr. H. C. Versey to a personal chair in the Department of Geology, 609
Appointment of Dr. P. Padget as Oppenheimer Geological Fellow in the Institute of African Geology, 609
Appointment of Dr. C. E. Lumsden as professor of pathology and head of the Department of Pathology, 1017
Appointment of Dr. R. O. Gandy as lecturer in applied mathematics, 1017
Appointment of R. J. R. Hayward as Brotherton lecturer in inorganic and structural chemistry, 1017
Appointment of Dr. G. R. Higginson as lecturer in mechanical engineering, 1017
Appointment of M. A. Jeeves as lecturer in psychology, 1017
Appointment of Dr. L. Mackinnon as lecturer in physics, 1017
Appointment of P. Sutcliffe as lecturer in civil engineering, 1017
Appointment of W. H. Trickett as lecturer in statistics, 1017
Building Developments, 1062
Gift of £21,000 from Brotherton and Co., Ltd., to the building fund for the Chemical Engineering Section of the Department of Coal Gas and Fuel Industries, 1062
Department of Coal Gas and Fuel Industries with Metallurgy and Chemical Engineering to be re-organized and replaced by the Houldsworth School of Applied Science, 1204
University of Liège . Symposium on the Ecology of Higher Fungi, 1159
University of Liverpool (Department of Social Science) : Occasional Papers, No. 2, Industrial Democracy—a Revaluation (W. H. Scott), 515
University of London : Resignation of Prof. V. Gordon Childe from the chair of prehistoric European archæology and the directorship of the Institute of Archæology, 15
Appointment of W. F Grimes as director of the Institute of Archæology, 16
Retirement of Prof. Leonard Hawkes from the chair of geology at Bedford College, 68
Appointment of Dr. Basil C. King to the chair of geology at Bedford College, 68
Appointment of Dr. K. W. Sykes to the University chair of physical chemistry at Queen Mary College, 68
Appointment of J. G. Ball to the University chair of physical metallurgy at the Imperial College of Science and Technology, 70, 559
Appointment of Dr. Walter Murgatroyd to the University chair of nuclear engineering at Queen Mary College, 70
Appointment of Prof. H. O. W. Richardson to the Hildred Carlile chair of physics in Bedford College, 70, 311
Appointment of Dr. L. Fowden to the University readership in plant chemistry at University College, 70
Appointment of Dr. C. W. Jones to the University readership in applied mathematics at the Imperial College of Science and Technology, 70
Appointment of Dr. John Lamb and Dr. J. H. Westcott to the University readerships in electrical engineering at the Imperial College of Science and Technology, 215
Title of reader in anatomy in the University conferred on D. H. L. Evans and D. A. Sholl, 215
Retirement of Prof. H. T. Flint from the Hildred Carlile chair of physics in Bedford College, 311
Appointment of Dr. D. R. Cox to the University readership in statistics at Birkbeck College, 314
Title of reader in biophysics in the University conferred on Dr. E. J. Harris, 314
Title of reader in pharmaceutical chemistry in the University conferred on Dr. Leonard Saunders, 314
Title of reader in geology in the University conferred on Dr. John Sutton, 314
Appointment of Dr. L. Pincherle to the University readership in physics at Bedford College, 415
Appointment of Dr. T. J. Williams to the University readership in mechanical engineering at King's College, 415
Appointment of Prof F. R. Winton as the first visiting professor of pharmacology in the University of Sydney, 464
Report on Research Work in the City and Guilds College, 1952–55 (Imperial College of Science and Technology), 570
Appointment of Dr. E. G. Healey to the University readership in zoology at Bedford College, 609
Appointment of Dr. D. C. Spanner to the University readership in botany at Bedford College, 609
Retirement of Sir Alexander Carr-Saunders from the directorship of the London School of Economics and Political Science, 689
Appointment of Sir Sydney Caine as director of the London School of Economics and Political Science, 689
Appointment of M. W. Humphrey Davies to the University chair of electrical engineering at Queen Mary College, 736
Appointment of Dr. E Shotton to the University chair of pharmaceutics in the School of Pharmacy, 736
Appointment of Dr. O. S. Heavens to the University readership in experimental physics at Royal Holloway College, 736
Appointment of Dr. H. B. Henbest to the University readership in organic chemistry at King's College, 736
Appointment of Dr. J. C. Pugh to the University readership in geography at King's College, 736
Appointment of Dr. A. J. B. Robertson to the University readership in physical chemistry at King's College, 736
Appointment of Prof. E. M. Glaser to the University readership in physiology at the London Hospital Medical College, 779
Appointment of Dr. B. C. L. Weedon to the University readership in organic chemistry at the Imperial College of Science and Technology, 779
Title of professor of genetics in the University conferred on Dr. Hans Gruneberg, 779
Geochemical and Geophysical Laboratories in the Imperial College (Prof. David Williams), 1012
Appointment of J. D. Evans to the University chair of prehistoric European archæology in the Institute of Archæology, 1017, 1062
Appointment of Dr. J. H. Birkinshaw to the University chair of biochemistry in the London School of Hygiene and Tropical Medicine, 1017, 1109
Appointment of P. T. Fink to the University readership in aeronautics at the Imperial College of Science and Technology, 1017
Appointment of Dr. G. P. Wibberley to the University readership in agriculture with special reference to agricultural economics at Wye College, 1017
Appointment of Dr. W. L. Wilcock to the University readership in instrument technology at the Imperial College of Science and Technology, 1017
Retirement of Prof. Harold Raistrick from the University chair of biochemistry in the London School of Hygiene and Tropical Medicine, 1108
Appointment of Dr. W. S. Peart to the University chair of medicine in St. Mary's Hospital Medical School, 1159
Appointment of Dr. Harry Wilman to the University readership in applied chemical physics at the Imperial College of Science and Technology, 1159
Title of reader in physical chemistry in the University conferred on Dr. J. A. Kitchener, 1208

Title of reader in acoustics in the University conferred on Dr. R. W. B. Stephens, 1208
University of London Appointments Board (edited for the): Careers for Graduates, *review* by T. H. Hawkins, 300
University of London Institute of Archæology: Appointment of W. F. Grimes as director, 16
  Appointment of J. D. Evans to the University of London chair of prehistoric European archæology, 1017, 1062
University of London School of Pharmacy: Title of reader in pharmaceutical chemistry in the University of London conferred on Dr. Leonard Saunders, 314
  Appointment of Dr. E. Shotton to the University chair of pharmaceutics, 736
University of Manchester: Appointment of Prof. Frank Morton to the chair of chemical engineering in the University and in the College of Technology, 460
  Appointment of P. R. Owen as professor of the mechanics of fluid motion, 562
University of Minas Gerais: Proceedings of a Symposium on Cell Secretion (edited by G. Schreiber), 831
University of Minnesota: Grant of 60,000 dollars from the Rockefeller Foundation, New York, for research in connexion with wheat stem rust, 976
  Elvin Charles Stakman Award given to Prof. W. L. Waterhouse, 1208
University of Naples: Symposium on the Chemistry, Biochemistry and Pharmacology of Thioctic Acid, 75
University of Nottingham: Third Easter School in Agricultural Science (Discussion on Leaf Growth), 215, 1114
University of Oslo: Grant from the Rockefeller Foundation, New York, for research in experimental biology, 977
University of Oxford: Appointment of Prof I. A. Richmond to the chair of archæology of the Roman Empire, 164
  Summer School in Theoretical Chemistry, 562
  Retirement of Prof. G. Humphrey from the chair of psychology, 1109
  Appointment of Prof. R. C. Oldfield to the chair of psychology, 1109
  Resignation of Viscount Cherwell from the Lee chair of experimental philosophy, 1155
  Appointment of Sir Francis Simon to the Lee chair of experimental philosophy, 1155
University of Padua: Grant of 10,000 dollars from the Rockefeller Foundation, New York, for research in virology, 977
  Grant of 10,000 dollars from the Rockefeller Foundation, New York, for research in organic chemistry, 977
University of Pennsylvania School of Medicine: Grant of 500,000 dollars from the Commonwealth Fund, New York, for medical education, 1064
University of Reading: The Cole Museum of Zoology, 555
University of Rochester School of Medicine and Dentistry: Grant of 750,000 dollars from the Commonwealth Fund, New York, for medical education, 1064
University of Rome: Grant of 30,000 dollars from the Rockefeller Foundation, New York, for research at the Institute of Biological Chemistry, 976
University of St. Andrews: Conference on Theoretical Physics, 268
University of Sheffield: Appointment of Miss S. K. R. Clarke as lecturer in bacteriology and virus diseases, 17
  Appointment of R. G. Siddall as lecturer in fuel technology and chemical engineering, 17
  Present chair of fuel technology and chemical engineering to be called the Newton Drew chair in memory of the late Mr. and Mrs. W. Newton Drew, 17
  Appointment of R. Kilpatrick as lecturer in pharmacology, 415
  Appointment of Dr. R. H. Tredgold as lecturer in physics, 415
  Gift of £15,000 from J. and J. Dyson, Ltd., Stannington, for the establishment of a chair in refractories technology, 650
  Appointment of Dr. James White as professor of refractories technology, 650
  Refractories Section of the Department of Metallurgy created a separate Department of Refractories Technology with Prof. J. White as its head, 1017
  Title of reader in electrical machinery in the University conferred on O. I. Butler, 1017
  Resignation of Dr. G. B. Greenough as senior lecturer in physical metallurgy, 1017
University of Southampton: Course on Acoustics for Aeronautical Engineers, 464
University of Sydney: Appointment of Prof. F. R. Winton as the first visiting professor of pharmacology, 464
University of Upsala: Honorary doctorate of medicine awarded to Prof. John F. Fulton, 1159
University of Utrecht: Grant of 12,000 dollars from the Rockefeller Foundation, New York, for the Biophysical Research Group, 977
University of Western Australia: Appointment of Dr D. C. Sinclair to the chair of anatomy, 1065
  Appointment of Dr. E. G. Saint to the chair of medicine, 1065
  Appointment of Dr. N. F. Stanley to the chair of microbiology, 1065
University (Australian): The Place of the, in the Community, and Post-Graduate Studies in the Australian Universities (Australian Vice-Chancellors' Committee Symposium on), 1071
University College of the Gold Coast: Agriculture in the (Prof. John Phillips), 610
University College, London: Appointment of Dr. L. Fowden to the University of London readership in plant chemistry, 70
  Title of reader in anatomy in the University of London conferred on D. H. L. Evans and D. A. Sholl, 215
  Title of reader in biophysics in the University of London conferred on Dr. E. J. Harris, 314
  Studies in Communication contributed to the Communication Research Centre (A. J. Ayer, J. B. S. Haldane, Colin Cherry, Sir Geoffrey Vickers, D. B. Fry, J. Z. Young, R. Wittkower, T. B. L. Webster and Randolph Quirk), *review* by Prof. G. Patrick Meredith, 446
  Appointment of Prof F. R. Winton as the first visiting professor of pharmacology in the University of Sydney, 464
  Title of professor of genetics in the University of London conferred on Dr. Hans Gruneberg, 779
University College of North Staffordshire: Grant from the Esso Development Company to support a postgraduate research student in the Department of Chemistry, 70
University College, Oxford: Gift of £25,000 from James George Weir to found a Fellowship devoted to one of the natural sciences, 777
University College, Swansea: Appointment of Dr. E. W. Knight Jones to the chair of zoology, 261
  Appointment of Dr. A. R. E. Singer to the newly created chair of metallurgy, 411
University Courses in the U.S.S.R. (M. G. Uroyev), 1165
University Education in Hungary (Prof. L. Tamas), 1072
University Expenditure on Research, 1063
University Grants Committee: Appointment of the Countess of Albemarle and the Rt. Hon. Justice Morris as members on matters relating to academic salaries only, 364
University Policy: The Age-Group Bulge and its Possible Effect on (Universities of Great Britain and Northern Ireland Conference on), 115
University Physics (Francis Weston Sears and Mark W. Zemansky), second edition, *review*, 957
University Professors and Lecturers, International Association of: Eighth University Conference, 1072
University Students: Future Numbers of—the Desperate Need for Technologists (Lord Simon of Wythenshawe), 1214
University Teachers: The Training of (S. Radcliffe), 217
University Teachers, Association of: Presidential Address, Technology and the Universities (Prof. J. L. Montrose), 1016
Unorthodox View of the Weather (Dr. E. G. Bowen), 1121
Unpublished Mathematical Tables: Accessions to the Depository of (Royal Society), 921
Unsaturated Aldehydes: Ultrasonic Relaxation in (M. S. de Groot and John Lamb), 1231
Unsaturated Fats: Muscular Dystrophy of Beef Cattle and (Dr. G. A. Garton, W. R. H. Duncan, K. L. Blaxter, R. F. McGill, G. A. M. Sharman and M. K. Hutcheson), 792, *erratum*, 1208
Unsaturated Fatty Acids: Metal Ion Catalysis and Polarity of Environment in the Aerobic Oxidation of (Dr. N. Uri), 1177
Unsöld, Prof. A.: Physik der Sternatmosphären, mit besonderer Berücksichtigung der Sonne, zweite Auflage, *review* by Dr. Arthur Beer, 1191
Unstable Oxidation Intermediates of Cysteine: Separation of (Dr. G. Toennies and J. J. Kolb), 281
Unusually Radioactive Fossil Fish from Thurso, Scotland (S. H. U. Bowie and D. Atkin), 487
Upbringing of Young People: Citizens of Tomorrow, a Study of the Influences affecting the (King George's Jubilee Trust), 149
Upper Air: 200 Miles Up, the Conquest of the (J. Gordon Vaeth), second edition, *review* by G. R. Noakes, 862
Upper Atmosphere: Rocket Exploration of the (Dr. F. E. Jones and Prof. H. S. W. Massey), 643
Uptake of Adenine-8-^{11}C by Whole and Fractional Amœbæ (Walter Plaut and Ronald C. Rustad), 89
Uptake of Amino-Acids by Plant Cells: A Stimulatory Action of Indole-3-Acetic Acid on the (Leonora Reinhold and R. G. Powell), 658
Uptake of Radioactive Phosphorus by Larvæ and Adults of Mosquitoes (L. J. Bruce-Chwatt and Dr. J. Hayward), 661
Uptake (Water), by Small Seeds: A Simple Potometer for Measuring Rate of (Dr. Shimon Klein), 707
Uracil: Incorporation of Adenine and, into Ribonucleic Acid during Enzyme Induction in Resting Yeast (Prof. H. Chantrenne), 579
Uranium for Peaceful Uses of Atomic Energy, 461
Urea: Effect of, on Trypsin and Alpha-Chymotrypsin (Dr. J. Ieuan Harris), 471
Urea Adducts of Glyceryl Esters (Dr. Francis Aylward and P. D. S. Wood), 146
Uri, Dr. N.: Metal Ion Catalysis and Polarity of Environment in the Aerobic Oxidation of Unsaturated Fatty Acids, 1177
Urine: A Modified Method of Two-Dimensional Zone Electrophoresis applied to Mucoproteins in Serum and (R. L. Markham), 125
Urine of Pregnant Mares: Isolation of β-Dihydroequilin and α-Dihydroequilenin from the (W. L. Glen, R. Barber, H. M. McConkey and G. A. Grant), 753
Urine and Blood Plasma in a Cystinuric Labrador Dog: Amino-Acid Patterns of (C. W. Crane and A. W. Turner), 237
Uronema: Chromosome Numbers in Three Species of (Y. S. R. K. Sarma), 900
Uroyev, M. G.: University Courses in the U.S.S.R., 1165
Urquhart, Dr. D. J.: Documentation of Applied Chemistry, 168
Urwin, J. R., and others: New Methods of Preparing Block Copolymers, 910
Usborne Memorial Prize of the Royal Aeronautical Society awarded to Dr. G. N. Lance, 919
Use of Capacity Measurements for the Study of Oxide Films on Metals (J. N. Wanklyn), 849
Use of the Film in the Improvement of Human Relations in Industry (Report of the Proceedings of the Scientific Film Association Conference on), 214
Use of Krypton-85 in Measuring Gas Clean-up Rates (Dr. D. J. Harris and Dr. P. O. Hawkins), 285
Use of Logarithmic Notation in Science and Engineering (Prof S. Devons), 372
Use of the Orcinol—Sulphuric Acid Reaction in the Positive Identification of certain Monosaccharides from a Salivary Mucoid (Dr. M. Irwin and Dr. A. G. Leaver), 1126
Use of Research Reactors in Nuclear Power Development (H. J. Grout), 205
Use of Sound and Ultrasound in Engineering and Science: Sonics—Techniques for the (Theodor F. Hueter and Prof. Richard H. Bolt), *review* by Dr H. D. Parbrook, 4
Use of Statistics in Personnel Management (Institute of Personnel Management and the National Institute of Industrial Psychology Course on), 779
Use and Maintenance of Electronic Instruments: Design, (Atomic Energy Research Establishment Specialized Course on), 922

Uses of High Temperatures in Science and Industry : Methods, Materials and Processes involved in the (Stanford Research Institute and the University of California Symposium on), 693
Uses of Phospholipids in Food : Recent Advances in the Knowledge and (Food Group and the Oils and Fats Group of the Society of Chemical Industry Conference on), 119
Uses as Tracers : The Applications of Radioactive Isotopes in Industry and their (College of Technology, Bristol, in collaboration with the Regional Council for Further Education for the South West, Course on), 1065
Uses (Possible), of Surface Methods as a Means of Testing Metals (with Special Reference to Optical Methods), (Non-Destructive Testing Group of the Institute of Physics Symposium on), 564
U.S.S.R. : Health Education in the (Dr. John Burton), 1111
  University Courses in the (M. G. Uroyev), 1165
Utilization of the Carboxyl Carbon of L-Phenylalanine for the Synthesis of the Amino-acids of Silk by *Bombyx mori* (S. Bricteux-Grégoire, W. G. Verly and Prof M. Florkin), 1237
Utilization of Electromagnetically Enriched Isotopes : Production and (Atomic Energy Research Establishment Conference on), 157
Utilization of Scientific and Professional Manpower : Proceedings of a Conference at Columbia University on the (National Manpower Council), 675
Utilization of Xanthin by Mould Fungi (Dr. E. D. M. Taha and M. Mokhtar Sharabash), 622
Uyeda, S. (Nagata, Prof. T., and) : Production of Self-Reversal of Thermo-remanent Magnetism by Heat Treatment of Ferromagnetic Minerals, 179

VACATION Course in Meteorology (Field Studies Council and the Royal Meteorological Society), 922
Vacuolation (Nuclear), in the Liver Cells of Depancreatized Baboons (Prof. Joseph Gillman and Christine Gilbert), 656
Vacuum : Arcs in (M. P. Reece), 1089
Vaeth, J. Gordon : 200 Miles Up, the Conquest of the Upper Air, second edition, *review* by G. R. Noakes, 862
Vaidaya, Prof. P. C., and Shah, K. B. . Influence of Expanding Space on the Gravitational Fields surrounding Individual Stars, 802
Valency : An Introduction to the Electronic Theory of (Dr. J. C. Speakman), third edition, *review* by G. Fowles, 909
Valentine, Prof. D. H. . Progress in the Study of the British Flora, 1164
Valentine, Dr L. : Polymers, Biocolloids and Polyelectrolytes—Symposium in Israel, 1161
Valves : Thermionic, 1904–1954, the First Fifty Years (Institution of Electrical Engineers), *review* by R. L. S.-R., 499
van Die, J. . Latex of Apocynaceae, 830
van Doesburg, P. H. (de Wilde, Prof. J., and) : Site of Hibernation of a Tachinid Larva within its Host, 1037
van Dyke, Prof. H. B. : The Neurohypophysis, 1019
Van Itterbeek, Prof. A. : *Obituary* of Prof. W. H. Keesom, 825
van Meel, L. : Le Phytoplancton, 520
Van Nordstrand, Robert A., and others : A New Alumina Trihydrate, 713
van de Hulst, Prof. Hendrik Awarded the Henry Draper Medal of the National Academy of Sciences, Washington, 924 ; work of, 924
van de Hulst, Prof. Hendrik, and Burgers, J. M. (edited by) . Gas Dynamics of Cosmic Clouds—a Symposium held at Cambridge, July 6–11, 1943, *review* by Dr. F D. Kahn, 352
van den Dungen, Prof. F · Elected a *correspondant* for the Mechanics Section of the Paris Academy of Sciences, 511
van der Pol, Dr. Balth, and Bremmer, Dr. H. : Operational Calculus based on the Two-sided Laplace Integral, second edition, *review* by Prof. L. M. Milne-Thomson, 954
van der Schaaf, P. C., and others : Amino-acid Composition of Hæmoglobin *E*, 627
Vanadium and Tungsten (Chromium,) : Determination of, by Activation Analysis using Low-Level Neutron Sources (Prof. M. Huaringa), 85
Vandel, Prof. A. Elected a non-resident member of the Paris Academy of Sciences, 918
Vandepitte, Dr. J , and Motulsky, Dr. Arno G : Abnormal Hæmoglobins in the Kasai Province of the Belgian Congo, 757
Vandermeerssche, G. (edited by) . Rapport Europées Congrès Toegepaste Electronenmicroscopie, Gent, 7–10 April 1954, *review* by Dr. V. E. Cosslett, 107
Vannerberg, Nils-Gosta (Brosset, Prof. Cyrill, and) . Formation of Calcium Superoxide, 238
Vapour Phase Chromatography (Hydrocarbon Research Group of the Institute of Petroleum Symposium on), 968
Vapour Pressure or Dew-point : Automatic Recording of Temperature and (Dr. U. Berger-Landefeldt), 608
Variable-Temperature Micro- or Macro-Dialyser : A Rapid (Dr. H. Stegemann and Dr. G. Toennies), 440
Variation in Mortality with Differences in Humidity among Mosquitoes exposed to BHC, Dieldrin and DDT (G. F. Burnett), 663
Variation (Seasonal), in the Egg Production of Hens : Control of (J. C. D. Hutchinson), 795
Variational Principles in Dynamics and Quantum Theory (Dr. Wolfgang Yourgrau and Stanley Madelstam), *review*, 1053
Variations in the Amount of Feulgen Stain in Nuclei of Plants Grown at Different Temperatures (Dr. L F. LaCour, Dr. E. M Deeley and Dr. J Chayen), 272
Varley, Dr. G. C. : Meyrick's Microlepidoptera, *review*, 1005
Varsányi, F. (Bardócz, Dr. Á., and) . Spectrochemical Analysis with Time-Resolved Spark Spectra, 222
Vaufrey, Prof Raymond : Préhistoire de l'Afrique, Tome I, Le Maghreb, *review* by M. C. Burkitt, 1006
Vaughan, D. J., and others : Synthesis of Long-Chain Fats by Bacteria isolated from Human Fæces, 237
Vaughan, G. N., and others : Mode of Action of *Iso*nicotinic Hydrazide, 480
Vaughan, H. G., and de Morton, M. E. : Change of Hardness in Steel due to Hydrogen, 1225
Večerek, B., and others : Di- and Mono-Taurobilirubin similar to a Directly Reacting Form of Bilirubin in Serum, 895
Vector of *Schistosoma haematobium* : *Bulinus (Pyrgophysa) forskalii* (Ehrenberg) as a (Dr. C A. Wright), 43
Vegetable Foodstuffs : Microscopy of, *review* by Dr. C. R. Metcalfe, 863
Vegetable Research Station National : Open Day, 653
Vegetable Tannins (Society of Leather Trades' Chemists Symposium on), 215, 562, 879
Vegetables (Dehydrated) Accelerated Storage Tests for (E. G. B. Gooding and R. B. Duckworth), 897
Vegetation (Tropical) : International Symposium on the Study of (Unesco), 463
Vegetation and Land-use Surveys in the Gold Coast : Soil, 118
Vein (Hepatic Portal) : Flow of Viscous Liquids in Branched Tubes, with reference to the (Dr. C. H. Barnett and Dr. W. Cochrane), 740
Velander, Prof. E. . Documentation of Applied Chemistry, 168
Velocity of Light : New Determinations of the (Colonel R. C. A. Edge), 618
Velocity (Apparent), of Alpha-Particles in Cloud Chambers (Prof. J. A. Prins and S. A. Hempenius), 487
Venables, L. S. V., and Venables, U. M : Birds and Mammals of Shetland, *review* by Frances Pitt, 45
Venables, Dr. P. F. R. : Technical Education, its Aims, Organisation and Future Development, *review* by Hugh A. Warren, 296
  Appointed principal of the Birmingham College of Technology, 411 ; work of, 411
Venanzi, L. M. (Chatt, Dr. J., and) : Olefin Complexes of Rhodium, 852
Venanzi, L. M., and others : Electronic Structures of Dithiocarbamates and Xanthates, 1042
Venge, Ole . Chromosome Number in Rabbit Blastocysts, 384
Venoms (Snake) : Purine Compounds in (Hazel M. Doery), 381
Ventral Ectodermal Ridge of the Tail in Mouse Embryos (Prof. Hans Grüneberg), 787
Verhoogen, Prof. J. : Elected a Member of the National Academy of Sciences, Washington, 926
Verly, W G., and others : Utilization of the Carboxyl Carbon of L-Phenylalanine for the Synthesis of the Amino-acids of Silk by *Bombyx mori*, 1237
Vermiculite : Diffusion of Interlayer Water in (G. F. Walker), 239
Vernal Phytoplankton Outburst in the English Channel : Factors Affecting the (Dr. W. R. G. Atkins and Pamela G. Jenkins), 1218
Vernon, Dr. J. : Appointed a member of the Advisory Council of the Commonwealth Scientific and Industrial Research Organization, 734
Vernon Prize for 1956 of the National Institute of Industrial Psychology awarded to Dr. J. S. Weiner, 464
Versey, Dr. H. C. : Appointed to a personal chair in the Department of Geology in the University of Leeds, 609
Vertebrates . The Origin of (Prof. N. J. Berrill), *review* by Prof. J. Z. Young, 764
Verulamium *Eophila oculata* at—a Roman Earthworm Population ? (Ronald M. Dobson and J. E. Satchell), 796
Verzele, M. : The Lupulone and *iso*Humulone Complex, 183
Veterinary Department, Kenya · Appointment of M. C. Round as field zoologist, 70
Veterinary Research in Britain, 212
Viability and Developmental Capacity of Eggs from Immature Mice treated with Gonadotrophins (Allen H. Gates), 754
Viable Fungal Spores : A Gas Phase in (Prof. C T. Ingold), 1242
Viandes : Bactériologie des Semi-Conserves de (Ier Symposium International de Bactériologie Alimentaire, organisé par la Section de Microbiologie des Produits Alimentaires de l'Association Internationale des Sociétés de Microbiologie, Lille, 1954), Rapports, Communications et Discussions, *review* by Dr. M Ingram, 6
Vicia faba : Effects of Cyanide on the Roots of (Lorna J. Lilly and Dr. J. M. Thoday), 338
  Regulation of Outbreeding in Field Beans (Jean M. Drayner), 489
Vick, Prof. F. A. · Education through Physics, 1158
Vickers, Dr. A. E. J. : Semi- and Non-Crystalline Materials, 122
  Fibre Microscopy, 513
Vickers, Sir Geoffrey, and others : Studies in Communication contributed to the Communication Research Centre, University College, London, *review* by Prof. G. Patrick Meredith, 446
Vickers-Armstrongs Scholarship in Naval Architecture (Institution of Naval Architects), 263
Vickerstaff, Dr. T. Appointed chief colourist of the Dyestuffs Division of Imperial Chemical Industries, Ltd., 1203 , work of, 1203
Vickery, J. R. (Sherstone, F. S., and) : A Biologically Active Fatty-acid in Malvaceae, 93
Victoria (Lake) · Sulphate Deficiency of (Dr. P. R. Hesse), 389
Vigurs, R. F., and others : The Suppressed Frame System of Telerecording, 519
Vincent, C. H. : The Gas-Multiplier, a New Type of Electron Multiplier, 391, *erratum*, 415
Vine, H. : Appointed principal research officer (soils), Western Region, Nigeria, 831
Vink, A. T. : Appointed assistant conservator of forests, British Guiana, 831
Vinyl Polymerization : Determination of the Rate of Initiation in (Dr. C. H. Bamford, A. D. Jenkins and R Johnston), 992
  Termination of Chains in, by Metal Salts (Dr. E. Collinson and Prof. F. S. Dainton), 1224
Virginia : Raleigh's Attempted Colonization of, *review* by Prof. Arthur Davies, 544
Virology : Introduction to (Dr. Gilbert Dalldorf), *review*, 451
Virtuous Quarrels, *review* by Dr. E. R. Leach, 1098
Virulence in *Pasteurella pestis* : An Antigen Determining (Dr. T. W. Burrows), 425
Virulent Attacks of Eyespot on Oats (Prof. R. McKay, L. B. Loughnane and T. Kavanagh), 193
Virus in Chronic Respiratory Disease of Turkeys (J. A. Fahey), 90
Virus Latent in Turnips (L. P. MacKinnon), 1157
Virus Y : Heat Treatment and Tissue Culture as a means of Freeing Potatoes from (A. D. Thomson), 709
Virus (Bushy Stunt) : Structure of (Dr. D. L. D. Caspar), 475

Virus (Clover), causing Green Petal Disease in Strawberry : Leafhopper Transmission of a (N. W. Frazier and A. F. Posnette), 1040
Virus (Influenza) : Action of Ribonuclease on the Multiplication of the (Miss J. Le Clerc), 578
  Filamentous Forms of (Sir Macfarlane Burnet), 130
Virus (Potato Leaf-roll) : Transmission of the, by Aphids (M. F. Day), 967
Virus (Tobacco Mosaic) : Infectivity of Ribonucleic Acid from (Dr. A. Gierer and Prof. G. Schramm), 702
  Mechanism of Inactivation of, by X-rays (Max A. Lauffer, David Trkula and Anne Buzzell), 890
  Reactivation of Partially Degraded (Roger G. Hart), 130
  Reversible, Host-induced, Changes in a Strain of (F. C. Bawden), 302
  Structure of—Radial Density Distribution in the Tobacco Mosaic Virus Particle (Dr. D. L. D. Caspar), 928 ; Location of the Ribonucleic Acid in the Tobacco Mosaic Virus Particle (Dr. Rosalind E. Franklin), 928
Virus Multiplication : Growth of Bovine Amniotic Ectoderm as a Cell Monolayer on Glass and its Use as a System for (T. W. F. Pay), 752
Viruses (Small) : Structure of (Dr. F. H. C. Crick and Dr. J. D. Watson), 473 : Structure of Bushy Stunt Virus (Dr. D. L. D. Caspar), 475
Viscous Liquids in Branched Tubes : Flow of, with reference to the Hepatic Portal Vein (Dr. C. H. Barnett and Dr. W. Cochrane), 740
Visibility of Noise in Television (R. D. A. Maurice, M. Gilbert, G. F. Newell and J. G. Spencer), 519
Visiting Scientists, Society for : Discussion on Government Responsibility in Industrial Research, 171
Visscher, Prof. M. B. : Elected a Member of the National Academy of Sciences, Washington, 926
Vitamin A Ester and Alcohol in the Liver of the Rat : Effect of Blocking the Reticulo-endothelial System on the Storage of (Dr. S. Krishnamurthy and J. Ganguly), 575
Vitamin B_{12} : Absorption of, from the Rat Intestine (Dr. E. S. Holdsworth and M. E. Coates), 701
  The Biochemistry of—a Symposium held at the London School of Hygiene and Tropical Medicine, 1955 (organized and edited by R. T. Williams), (Biochemical Society Symposia No. 13), *review*, 403
  Paramagnetism as a Reduction Product of (Dr. F. Grün and R. Haas), 378
Vitamin B_{12} Activity of *Chlorella vulgaris* Beij and *Anabaena cylindrica* Lemm (F. Brown, Dr. W. F. J. Cuthbertson and Dr. G. E Fogg), 188
Vitamin B_{12} Deficiency : Effect of, on Liver Dehydrogenase Activity in Rats (V. Sreenivasa Murthy, H. S. R. Desikachar and M. Swaminathan), 750
Vitamin D ; Effect of, on the Phosphorus Content of Rachitic Rat Cartilage (J. G. Joshi and P. K. Dikshit), 625
Vitamin K_3 : Spectrophotometric Method for the Estimation of (Vanamala Sathe, J. B. Dave and Dr. C. V. Ramakrishnan), 276
Vitamin-deficient Hyperphagic Animals : Mechanism of Anorexia in (Dr. L. R. C. Agnew and Jean Mayer), 1235
Vitamins—Memorial Essays to Sir Edward Mellanby, 314
Viscosity of Liquids and Ultrasonic Studies (Prof. A. K. Dutta, B. C. Ray and H. K. Rout), 1227
Viviani, R., and others : Orotic Acid as a Survival Factor in Rats Deficient in the Animal Protein Factors of Casein, 757
Vlček, Dr. A. A. : Formation and Reduction of Zero-Valent Metal Complexes studied Polarographically, 1043
Vlitos, A. J., and others : A New Unidentified Indole Hormone in Maryland Mammoth Tobacco, 890
Vogel, Harold L. : Appointed representative of the Director-General of the United Nations Food and Agriculture Organization in North America, 70
Voices on the Wind—Polynesian Myths and Chants (Katharine Luomala), *review* by M. C. Burkitt, 1100
Vokes, F. M., and Jeffery, W. G. : Awarded jointly the William Frecheville Student's Prize for 1954–55 of the Institution of Mining and Metallurgy, 966
Vortex (Magnetically Induced), for Small-scale Aerated Culture Studies (C. R. Newing and A. K. MacLeod), 939
Vos, Dr. Aafje · Low-Temperature Crystallography, 1068
Von Sanguinis : Publication transferred to S. Karger, Basle, 215
Vreeland, J. A., and others : Spectroscopy, 737
Vugman, Itamar (Mota, Dr. Ivan, and) : Effects of Anaphylactic Shock and Compound 48/80 on the Mast Cells of the Guinea Pig Lung, 427

WADDINGTON, Prof. C. H. : Principles of Embryology, *review* by Dr. Julian Huxley, 807
  Embryology, Epigenetics and Biogenetics, 1241
Waddington, Dr. C. J. : Awarded a Mackinnon Research Studentship by the Royal Society, 215
Waddington, T. C. : Semiconductors, 833
Wadsworth, Dr. G. R., and Platt, Prof. B. S. : Diet and Anæmia, 878
Waelsch, Prof. H., and others : Action of Chlorpromazine on Oxidative Phosphorylation of Liver and Brain Mitochondria, 1234
Wagg, R. E. : Detergents in the Factory, *review*, 249
  Fibre Microscopy, 516
Wagner, Robert P., and Mitchell, Herschel K. : Genetics and Metabolism, *review* by Prof. J. B. S. Haldane, 905
Wagstaffe, Reginald, and Fidler, Dr. J. Havelock (edited and compiled by) : The Preservation of Natural History Specimens, Vol. I, Invertebrates, *review* by W. Eric Stoneman, 679
Wainwright, A. (Barker, A., and) : Hair-line Cracks in Low-alloy Steels, 1136
Waite Agricultural Research Institute : Retirement of Prof. J. A. Prescott from the directorship, 689
  Appointment of Dr. James Melville as director, 689
Wakefield Gold Medal of the Royal Aeronautical Society awarded to Group-Captain W. K. Stewart, 919
Wald, Dr. George, and Brown, Paul K. : Synthesis and Bleaching of Rhodopsin, 174
Wales (England and), for the Year 1952 : Text Volume of the Registrar-General's Statistical Review of (General Register Office), 313
Walker, A. R. P., and others : Reduction to Normal Levels of the High Erythrocyte Sedimentation-Rates in Apparently Healthy South African Bantu Men, 480
Walker, F. S. : Appointed conservator of forests, grade A, Federation of Malaya, 831
Walker, F. T. : Periodicity of the Laminariaceae around Scotland, 1246
Walker, G. F. : Diffusion of Interlayer Water in Vermiculite, 239
Walker, Dr. J. M. : The Neurohypophysis, 1020
Walker, Dr. P. B. : Promoted to Chief Scientific Officer in the Scientific Civil Service, 218 ; work of, 218
Wallace, H. R. : Migration of Nematodes, 287
Wallis, S. W. J. : Automatic Control in the Process Industries, 254
Walter, K. (Holzbauer, Dr. Marg., and) : Inactivation of the Adrenal Ascorbic Acid-depleting Activity of Pituitary Extracts by Ascorbic Acid, 379
Walter, Prof. William G., and McBee, Prof. Richard H. : General Microbiology, *review* by T. H. Hawkins, 107
Walter, Dr. W. Grey : The Imitation of Mentality, 684
  Colour Illusions and Aberrations during Stimulation by Flickering Light, 710
Walters, Dr. S. M. : Progress in the Study of the British Flora, 1164
Walton, Prof. J. . Fossil Plants of the Carboniferous Rocks of Great Britain, *review*, 152
Wanklyn, J. N. : Use of Capacity Measurements for the Study of Oxide Films on Metals, 849
Wanner, Dr. Ernst : *Obituary* by Ernest Tillotson, 558
Ward, A. G. : Rheology of Proteins, 516
Ward, Dr. F. A. B. : The Presentation of Science to the Public, 1066
Ward, Prof. S. G. : Mineral Dressing, *review*, 908
Ward, W. H. : Snow Accumulation and Ablation, 563
Wardale, H. : Appointed a member of the National Parks Commission, 167
Wardlaw, Prof. C. W. : Leaf Growth, 1114
Wardlaw, Prof. C. W., and Cutter, E. G. : Morphogenetic Studies of *Dryopteris*, 217
Wardlaw, Prof. W. : Recent Advances in the Chemistry of Colouring Matters, 645
Warfare (Undersea) : A Survey Report on Human Factors in (prepared by the Panel on Psychology and Physiology of the United States National Research Council Committee on Undersea Warfare), *review* by Sir Frederic Bartlett, 105
Waring, A. B. : Management and Human Relations, 162
Warner, Dr. A. J. : Epoxide Resins, 964
Warner, J. C. : Elected a Member of the National Academy of Sciences, Washington, 926
Warner, R. B. : Appointed principal agricultural officer, Western Region, Nigeria, 1112
Warner Memorial Medal of the Textile Institute awarded to Dr. J. M. Preston 1113
Warren, Hugh A. . Developments in Technical Education, *review*, 296
Warren, Dr. J. W. : Teaching of Atomic and Nuclear Physics, 780
Wase, Dr. Arthur W., and Feng, Yu Sheng Louise . Effect of Sialoadenectomy on Thyroid Activity, 624
Washington University, St. Louis, Mo. . Appointment of Dr. E. U. Condon as professor of physics and chairman of the Department of Physics, 1109
  Appointment of Dr. M. W. Friedlander as a research associate in the Department of Physics, 1109
  Appointment of E. B. D. Lambe as assistant professor of physics, 1109
Washington (George) University School of Medicine : Grant of 500,000 dollars from the Commonwealth Fund, New York, for medical education, 1064
Wassermann, Dr. A. : Rheology of Proteins, 517
Wastage and its Control, *review*, 720
Waste Materials (Industrial) : Disposal of (Society of Chemical Industry Conference on), 562
Water : Modification of the Bulk Mechanical Properties of, by Complex Formation in Dilute Solution (T. Nash), 948
Water (Fresh), from Salt Water (D. J. Neville-Jones), 270
Water (Heavy) : Enrichment of, by a Biological Method (L. Carlbom, R. Skjoldebrand and N. Nielsen), 988
  Protein Denaturation in (Robert H. Maybury and Dr. Joseph J. Katz), 629
Water (Interlayer) · Diffusion of, in Vermiculite (G. F. Walker), 239
Water (Potable), in Britain : Fluoridation of, 1017
Water (Pure) : Ion-Exchange Resins for the Production of, 509
Water (Salt) : Fresh Water from (D. J. Neville-Jones), 270
Water Resources of Great Britain (Prof. W. G. V. Balchin), 75
Water Uptake by Small Seeds . A Simple Potometer for Measuring Rate of (Dr. Shimon Klein), 707
Water-boatman : Mitochondrial *Nebenkern* of the (Dr. John R. Baker), 1039
Water-soluble Components of Herbage : Avidity of the, for Added Cupric Ions (C. F. Mills and Grace Murray), 793
Waterhouse, Dr. J. A. H., and others : Changes in the Dimensions of the Nuclei of Neurones with Activity, 1081
Waterhouse, Prof. W. L. : Given the Elvin Charles Stakman Award of the University of Minnesota, 1208
Waters, D. B. : *Obituary*, 557
Waters, Dr. W. A. : Physics for the Organic Chemist, *review*, 721
Waters, Dr. W. A. (collected and edited by Milton, Dr. R. F., and) : Methods of Quantitative Micro-Analysis, second edition, *review* by E. Q. Laws, 153
Waters (English) : Occurrence of *Achtheres percarum* Nordmann in (J. P. Harding and the late F. W. K. Gervers), 664
Waters (Sea) : The Chemistry and Fertility of (Dr. H. W. Harvey), *review* by Michael Graham, 549
Waterston, J. M : Appointed director of agricultural research, Federation of Nigeria, 831
Waterways (Inland), in Britain (Appointment of a Committee of Inquiry by the Minister of Transport and Civil Aviation), 312
Watkins, J. : Some Recent Developments in Magnetism, 517
Watkins, Dr Winifred M (Morgan, Prof. W. T. J., and) : The Product of the Human Blood Group *A* and *B* Genes in Individuals belonging to Group *AB*, 521

Watson, Dr. D. J. : Leaf Growth, 1115
Watson, Dr. D. J. (Owen, P. C., and) : Effect on Crop Growth of Rain after Prolonged Drought, 847
Watson, G. (Boyland, Prof. E., and) : 3-Hydroxyanthranilic Acid, a Carcinogen produced by Endogenous Metabolism, 837
Watson, G. S. (Cairns, H. J. F., and) : Multiplicity Reactivation of Bacteriophage, 131
Watson, Dr. J. D. (Crick, Dr. F. H. C., and): Structure of Small Viruses, 473
Watson, Prof. J. W. : Elected a Fellow of the Royal Society of Edinburgh, 507
Watson, Sir Malcolm : *Obituary* by Prof. N. H. Swellengrebel, 162
Watson Medal of the National Academy of Sciences, Washington, awarded to Dr. Chester B. Watts, 924
Watts, Dr. Chester B. : Awarded the Watson Medal of the National Academy of Sciences, Washington, 924 ; work of, 924
Watts, C. R. : Fibre Microscopy, 516
Watts, J. : Fibre Microscopy, 516
Wave (Air-transmitted Shock), in Muscular Tissue : Propagation of an (Carl-Johan Clemedson, Arne Jonsson and Hjalmar Pettersson), 380
Wave-lengths (Centimetre) . A Film Radiometer for (J. A Lane), 392
  Spectroscopy at, *review* by Dr. D. M. S. Bagguley, 1099
Waves (Shock) : Determination of Arc Temperatures using (D. Whittaker and Dr. H. Edels), 484
Wayman, P. A. : Daily Maps of the Sun, 518
Waymouth, Dr. Charity : Quotation of Titles of Papers in Review Articles, 98
Weapons (Nuclear) : International Control of, 17
Weather (Royal Meteorological Society Prize for an essay on the Place of Meteorology in Liberal Education, to mark the completion of ten years of publication of), 415
Weather : An Unorthodox View of the (Dr. E. G. Bowen), 1121
Weather Processes : Large-Scale (Dr. R. C Sutcliffe), 113
Weather Service : Your (Meteorological Office and the Central Office of Information), revised edition, 1158
Weather and the Land (Ministry of Agriculture, Fisheries and Food, Bulletin No. 165), 569
Weather Charts : Analysis of, *review* by Dr. J. M. Stagg, 956
Weaver, Boyd : Production and Utilization of Electromagnetically Enriched Isotopes, 158
Weaver, C., and Benjamin, P. : Measurement of the Thickness of Thin Films by Multiple-Beam Interference, 1030
Weaver, Elbert C, and Foster, Laurence S. : Chemistry of Our Times, second edition, *review* by G. Fowles, 767
Weaver, Dr. Warren : The Influence of Science on People (Presidential Address to the American Association for the Advancement of Science), 694
Webb, A. A. : Awarded a Salters' Scholarship by the Salters' Company, 1113
Webb, John : Thermal Conductivity of Soil, 989
Webster, C. C. : Appointed deputy director of agriculture, Federation of Malaya, 1112
Webster, G. : Appointed conservator of forests, Uganda, 1207
Webster, T. B L., and others : Studies in Communication contributed to the Communication Research Centre, University College, London, *review* by Prof. G. Patrick Meredith, 446
Wedderburn, Sir Ernest : Address at a meeting of the Scottish centre of the Royal Meteorological Society held to celebrate the centenary of the foundation of the Scottish Meteorological Society, 371
Wedeck, Harry E. : Dictionary of Magic, *review* by Dr. E. J. Dingwall, 1053
Wedel, Dr. W. R. : American Prairies, 1157
Weedon, Dr. B. C. L : Appointed to the University of London readership in organic chemistry at the Imperial College of Science and Technology, 779
Weekes, K. : Movements in the Ionosphere, 308
Weevil (Bark) : Chromosomal Polymorphism in a (Dr. Stanley G. Smith), 386
Weickmann, Dr. H. : Cloud Physics, 320
Weidlein, Dr. E. R. : Retirement from the presidency of the Mellon Institute of Industrial Research, Pittsburgh, 733 ; work of, 733
Weiner, Dr. J. S. : Awarded the Vernon Prize for 1956 of the National Institute of Industrial Psychology, 464
  Biology of Puberty, *review*, 860
Weinstock, B. : Spectroscopy, 738
Weipers, Prof. W. L. : Infections in Laboratory Animals, 1198
Weir, Dr. J. : *Obituary* of Prof. Duncan Leitch, 309
Weir, James George : Gift of £25,000 to University College, Oxford, to found a Fellowship devoted to one of the natural sciences, 777
Weiss, Dr. H. : Appointed a British Council Research Fellow in chemistry in the University of Birmingham, 215
Weiss, Dr. J. : Appointed to a personal professorship of radiation chemistry in the Newcastle Division of the University of Durham, 1110
Weiss, Dr. J , and others : Effect of Solute Concentration in the Irradiation of Aqueous Solutions by Ionizing Radiations, 883
Weiss, Dr. P. : Regularity and Consistency of Design in Living Forms, 1157
Weissberger, A., and others (edited by) : Organic Analysis, Vol. 2, *review* by Dr. G. M. Bennett, 546
Weissberger, A., and Proskauer, Eric S. : Organic Solvents, completely revised second edition by John A. Riddick and Emory E. Toops, Jr., *review*, 639
Weitz, Dr. B. : Zoonoses in East Africa, 407
Weizmann Institute of Science (Commission on Macromolecules of the International Union of Pure and Applied Chemistry and the) : International Symposium on Macromolecular Chemistry (Polymers, Biocolloids and Polyelectrolytes in Solution), 562, 1161
Welch, G. A. (James, R. H., and) . Adsorption of Trace Amounts of Cations on Anion Exchange Resins by the Formation of Insoluble Salts, 183
Welch, Dr. Henry, and Marti-Ibanez, Dr. Felix (edited by) : Antibiotics Annual, 1954–55—Proceedings of the Second Annual Symposium on Antibiotics, *review* by Dr. N. G. Heatley, 496
Welding (British Welding Research Association Summer School on), 922
Welding of Aluminium and its Alloys Research into the (Aluminium Development Association, Research Report No. 27, prepared by Dr. W. I. Pumphrey), 568
Welding Research Association, British : Summer School on Welding, 922
Wellcome Museum of Medical Science : Appointment of Lieut.-Colonel C. A. Bozman as director, 211
Wellens, John : Technical Education—Shortage of Scientists, Technologists and Technicians, 967
Wells, Dr. C. F. : Transfer of Hydrogen from Alcohols to Quinones, 483
Wells, Prof. G. P. : Sources of Animal Behaviour, 372
Wells, J. R. : Appointed veterinary officer, Uganda, 70
Wells, Dr. L. H. : Appointed to the chair of anatomy in the University of Cape Town, 873 ; work of, 873
Wells, O. C. : Electron Microscopy of Fibres, 318
Went, Prof. F. W. : Elected a *correspondant* for the Botany Section of the Paris Academy of Sciences, 918
Wessel, Carl J. (edited by Greathouse, Glenn A., and) . Deterioration of Materials, *review*, 720
West, Dr. D. J. : Homosexuality, *review* by Dr. Clifford Allen, 54
West African Cacao Research Institute, Gold Coast : Appointment of D. R. Glendinning as scientific officer, plant breeder, 1207
West African Council for Medical Research : Appointment of W. J. Bell as special grade medical research officer, 736
  Appointment of B. O L. Duke as medical research officer, grade I, Western Region, 1207
West African Institute for Trypanosomiasis Research, Nigeria : Appointment of D. G. Godfrey as scientific officer (parasitologist), 1207
West African Stored Products Research Unit, Department of Marketing and Exports, Federation of Nigeria : Appointment of L. A. W. Hayward as principal scientific officer, 70
Westcott, G. F. (compiled by) : Mechanical and Electrical Engineering (Science Museum, Classified Lists of Historical Events, 1), 830
Westcott, Dr. J. H. : Appointed to the University of London readership in electrical engineering at the Imperial College of Science and Technology, 215
Westergaard, Prof. M. : Genetic Problems of the Atomic Age, 103
Western Germany : A Brief Review of Science and Technology in (K. H. Lauder), 316
Westfall, Jr., Prof. Minter J. (Needham, Prof. James G., and) : A Manual of the Dragonflies of North America (Anisoptera), *review* by D. E. Kimmins, 450
Westleton Heath Nature Reserve, 611
Wever, Prof. F. : Mechanism of Phase Transformations in Metals, 420
Weyl, Prof. Hermann : *Obituary* by Prof. Freeman J. Dyson, 457
Whale (Beaked), *Mesoplodon stejnegeri* : Skull of a, received by the British Museum (Natural History) from the Malacca Museums Board, 215
Whale (Pilot), *Globicephala melaena* : The Carotid Body of the (L. L. de Kock), 1084
Whaller, Dr. W. B. : Vegetable Tannins, 881
Whalley, W. : Chemistry of Oxygenated Heterocyclic Compounds, 1117
Whalley, Dr. W. B., and others : Antibiotics and Mould Metabolites, 1058
What is Science ? (edited by James R. Newman), *review* by Dr. W. L. Sumner, 1097
Wheat Breeding : A Small-scale Quality Test in (L. G. Copp), 756
Wheelan, J. W. : Appointed senior assistant conservator of forests, Gold Coast, 1112
Wheeler, Prof. T. S. : Vegetable Tannins, 880
  Chemistry of Oxygenated Heterocyclic Compounds, 1116
Whiskers : Metal (Dr. J. Franks), 984
Whistling Atmospherics : Observations of, at Geomagnetically Conjugate Points (M. G. Morgan and H. E. Dinger), 29 ; (M. G. Morgan and G. McK. Allcock), 30
Whiston, Prof. J. R. H. : *Obituary* by Dr E. C Baughan, 775
Whitaker, T. : An Introduction to Precast Concrete, *review*, 200
Whitby, Sir Lionel : Importance of Endocrinology in Clinical Medicine, 1019
White, Prof. E. G. : Appointed a member of the Agricultural Improvement Council for England and Wales, 167
White, Dr. E I. : Elected a Fellow of the Royal Society, 559
White, Dr. G. K., and Woods, Dr. S. B. . Thermal Conductivity of Solid Argon at Low Temperatures, 851
White, Prof. George W. : Lewis Evans (1700–56), a Scientist in Colonial America, 1055
White, Dr. Helen R. : Fæcal Micro-organisms of Parabiotic Rats, 751
White, Dr. James : Appointed first holder of the Dyson chair of refractories technology in the University of Sheffield, 650 ; work of, 650
White, Dr. Philip R. : Cultivation of Animal and Plant Cells, *review* by Prof. R. J. Gautheret, 719
White, Dr T. : Vegetable Tannins, 879
White, Terence de Vere : The Story of the Royal Dublin Society, *review* by Sir Nigel Ball, 255
White Clover and Perennial Ryegrass : Components of the Total Magnesium Content within the Leaves of (T. F. Neales), 388
White Paper on Defence, 335
White Paper on Government Information Services—Statement showing Estimated Expenditure, 1955–56, 691
White Paper on Technical Education, 461, 591
White Pigments : Effect of some, on the Actinic Degradation of Cotton (W. R. Hindson and P. G. Kelly), 1241
Whitehead, Dr. F H : Progress in the Study of the British Flora, 1163
Whitehead, Dr Stanley : Epoxide Resins, 962
  Obituary by R. Davis, 1060
Whiteley, Dr. M. A. : *Obituary* by Dr. L. N. Owen, 1202
Whittaker, D , and Edels, Dr. H. : Determination of Arc Temperatures using Shock Waves, 484
Whittaker, Sir Edmund : *Obituary* by Prof. A. C. Aitken, 730
Whittaker, Dr. E. J. W. . Semi- and Non-Crystalline Materials, 122, *erratum*, 314
Whittaker, V. N. (Broom, T., and) : Slip during Fatigue of an Age-hardened Alloy, 486
Whitten, W. K. : Culture of Tubal Mouse Ova, 96
Whittet, T D. : Elected a Foreign Member of the Royal Spanish Academy of Pharmacy, 1018
Why Laboratory Animals Die (Dr. W. Lane-Petter), 1198

Wibberley, Dr. G. P. : Appointed to the University of London readership in agriculture with special reference to agricultural economics at Wye College, 1017
Wiegand, Dr. C., and others : Antiprotons, 11
Wightman, Dr. William P. D. : Embryology, Epigenetics and Biogenetics, 1240
Wilcock, R. : Awarded a Williams Prize for 1955 of the Iron and Steel Institute, 919
Wild Flowers : British (Dr. John Hutchinson), *review*, 641
Wildlife in our National Refuges : Seeing America's (Devereux Butcher), *review* by E. M. Nicholson, 765
Wild-Life Refuges in the United States, *review* by E. M. Nicholson, 765
Wilets, L. : Spectroscopy, 737
Wiley, Farida A. (edited by) : Theodore Roosevelt's America, *review* by Dr. L. Harrison Matthews, 813
Wilkes, Dr. M. V. : Movements in the Ionosphere, 308
  Elected a Fellow of the Royal Society, 559
Wilkins, Dr. H. Percy, and Moore, Patrick : The Moon, *review*, 1101
Wilkins, Dr. M. H. F. : The Structure of Nucleic Acids and their Role in Protein Synthesis, 603
Wilkins, Dr. R. A. : Elected a Fellow of the Institute of Metals, 922
Wilkinson, Dr. D. H. : Elected a Fellow of the Royal Society, 559
Wilkinson, Dr. J. H. : Semi-Micro Organic Preparations, *review* by G. Fowles, 957
Willcocks, Frank C. : *Obituary* by Dr. W. Lawrence Balls, 359
Willcox, J. S. : Chemistry and Crop Nutrition, 208
Willett, Dr. K. C. : Zoonoses in East Africa, 407, 948
Willett, R. W. : Appointed director of the Geological Survey of New Zealand, 776 ; work of, 776
Williams, C. M., and others : The 'Seebeck Effect' in a Purely Ionic System, 668
Williams, Dr. D. : Promoted to Deputy Chief Scientific Officer in the Scientific Civil Service, 218 ; work of, 218
Williams, Prof. David : Geochemical and Geophysical Laboratories in the Imperial College, 1012
  Awarded a research grant by the Leverhulme Trustees, 918
Williams, Dr. D. N. : Metallographic Evidence of Mechanical Twinning in an Alpha-Beta Titanium Alloy, 436
Williams, Prof. F. C. : Digital Computer Techniques, 1069
Williams, G. P. (Gold, L. W., and) : Dependence of Snowfall on Temperature, 1137
Williams, I. H., and Hudson, Dr. J. P. : Effect of Environment upon the Growth and Development of Raspberry Canes, 798
Williams, K., and others : Examples of Anti-competitive Inhibition, 432
Williams, Dr. K. A. : Phospholipids in Foods, 565
  Elected president of the Society for Analytical Chemistry, 651
Williams, Marion A., and others : Cytoplasmic Structures in Yeasts, 1041
Williams, Dr. R. J. P. : Models for Metallo-Enzymes, 304
Williams, R. T. (organized and edited by) : The Biochemistry of Vitamin B_{12}, a Symposium held at the London School of Hygiene and Tropical Medicine, 1955 (Biochemical Society Symposia No. 13), *review*, 403
Williams, Dr. T. J. : Appointed to the University of London readership in mechanical engineering at King's College, 415
Williams, Prof. W. T. : Leaf Growth, 1114
Williams Prize (additional) for 1954 of the Iron and Steel Institute awarded jointly to F. A. Gray and S. A. Brooks, 919
Williams Prizes for 1955 of the Iron and Steel Institute awarded to A. J. Kesterton and R. Wilcock, 919
Williamson, Dr. J., and Desowitz, Dr. R. S. : Prophylactic Activity of Suramin Complexes in Animal Trypanosomiasis, 1074
Willis, B. T. M. (Suzuki, T., and) : Diffraction from Dislocations, 712
Willis, D., and others : Mode of Action of *Isonicotinic* Hydrazide, 480
Willis, Dr. H. F. : *Obituary* of Dr. E. C. S. Megaw, 410
Wills, Dr. Lucy : Diet and Anæmia, 878
Wilman, Dr. Harry : Appointed to the University of London readership in applied chemical physics at the Imperial College of Science and Technology, 1159
Wilmot, P. D. : Appointed a development chemist in London in the Development and Research Department of the Mond Nickel Co., Ltd., 215
Wilson, Dr. D. P. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 220 ; work of, 220
Wilson, Dr. George : *Obituary* of Dr. George Slater, 459
Wilson, Dr. G. S. : *Obituary* of Dr. Arthur Felix, 257
Wilson, James : Resignation of the principalship of the Birmingham College of Technology, 411
Wilson, J. C. : Appointed senior assistant conservator of forests, Gold Coast, 1112
Winans, J. G., and others : Spectroscopy, 738
Wind : Voices on the—Polynesian Myths and Chants (Katharine Luomala), *review* by M. C. Burkitt, 1100
Wind Power : The Generation of Electricity by (E. W. Golding), *review* by Dr. C. W. Marshall, 1050
Winds : Power and Energy from the, *review* by Dr. C. W. Marshall, 1050
Winds in the Ionosphere : A Simple Method of studying, by using Continuous-Wave Radio (Dr. B. Ramachandra Rao and D. Satyanarayana Murty), 1222
Winegard, W. C. : Melting, Diffusion and related topics, 23
Winge, Prof. Ö. : Elected a Foreign Member of the Linnean Society of London, 1014
Winge, Prof. Ö., and Roberts, Dr. Catherine : Complementary Action of Melibiase and Galactozymase on Raffinose Fermentation, 383
Winning, Dr. C. H. : Enhanced Initiating Effect of Multiple Shock Intersections, 33
Winter in a Potato Clamp : Reproduction of Potato Root Eelworm during the (T. J. Legowski and E. B. Brown), 287
Winteringham, F. P. W. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 220 ; work of, 220
  Resistance of Insects to Insecticides, 357
Winteringham, F. P. W., and others : Separation of the Isomers of Benzene Hexachloride by Reversed-Phase Paper-Partition Chromatography, 86
Winton, Prof. F. R. : Appointed the first visiting professor of pharmacology in the University of Sydney, 464
Wirz, Prof. H. : The Neurohypophysis, 1020
Wisconsin Symposium on Solar Energy, 1953, *review*, 1145
Wiseman, Dr. J. D. H. : The Ocean Floor, *review*, 450
Wishart, Dr. John, and Sanders, Dr. H. G. : Principles and Practice of Field Experimentation, second edition, *review* by Dr. D. J. Finney, 680
Wishart, P. J., and others : The *Diego* Blood Factor in Brazilian Indians, 41
Wishart, P. J. (Junqueira, Dr. P. C., and) : Blood Groups of Brazilian Indians (Carajás), 40
Wiskocil, Prof. Clement T., and others : The Testing and Inspection of Engineering Materials, second edition, *review* by K. J. Pascoe, 248
Wittcoff, Dr. H., and others : Epoxide Resins, 963
Wittkower, W., and others : Studies in Communication contributed to the Communication Research Centre, University College, London, *review* by Prof. G. Patrick Meredith, 446
Wohlfarth, Dr. E. P. : Some Recent Developments in Magnetism, 517
Wokes, Dr. F. : Diet and Anæmia, 879
Wolken, J. J., and Schwertz, F. A. : Molecular Weight of Algal Chloroplastin, 136
Wollaston Fund for 1956 of the Geological Society of London awarded to W. B. Harland, 165
Wollaston Medal for 1956 of the Geological Society of London awarded to Prof. Arthur Holmes, 165
Wolstenholme, G. E. W., and Cameron, Margaret P. (edited by) : Experimental Tuberculosis—Bacillus and Host, with an Addendum on Leprosy, *review* by Dr. Derek Hobson, 448
Wood, Dr. A. B. : A Textbook of Sound, third edition, *review* by Dr. W. H. George, 814
Wood, C. B. B., and others : The Suppressed Frame System of Telerecording, 519
Wood, E. J. Ferguson, and Davis, Peter S. : Importance of Smaller Phytoplankton Elements, 438
Wood, Frank Bradshaw (edited by) : Astronomical Photoelectric Photometry, *review* by Dr. A. H. Jarrett, 814
Wood, H. J. : On loan by the Dominion Laboratory, Department of Scientific and Industrial Research, New Zealand, to the Government of Indonesia, to teach new methods of chemical analysis to the staff of the Chemistry Institute at Bogor, 118
Wood, M. J. : Electron Microscopy of Fibres, 319
Wood, M. J., and others : Connective Tissue and its Changes with Age, 467
  Helical Nature of the Collagen Fibril, 697
Wood, P. D. S. (Aylward, Dr. Francis, and) : Urea Adducts of Glyceryl Esters, 146
Wood, P. W. : *Obituary* by Ebenezer Cunningham, 1202
Wood, R. F. : Studies of North-West American Forests in relation to Sylviculture in Great Britain, 1207
Wood, R. K. S. (Singh, R. K., and) : Production and Properties of the Pectic Enzymes secreted by *Fusarium moniliforme*, 738
Wood (Trueman) Memorial Lecture of the Royal Society of Arts (Prof. E. N. da C. Andrade), 164
Wood Science, Institute of : Formation of an, 690
Woodall, R. G., and others : Electrical Equipment of Aircraft, 1211
Woodall, R. H. : Awarded the George Taylor (of Australia) Gold Medal of the Royal Aeronautical Society, 919
Woodcock, Dr. A. H. : Cloud Physics, 320
Woodman, Dr. H. E. : *Obituary* by Dr. R. E. Evans, 648
Woodroffe, G. E., and others : Polymorphism and Parthenogenesis in a Ptinid Beetle, 847
Woodruff, Prof. A. W. : Diet and Anæmia, 878
Woods, H. J. : Electron Microscopy of Fibres, 318
Woods, H. J., and Sikorski, Dr. J. : Fibre Microscopy, 516
Woods, Dr. S. B. (White, Dr. G. K., and) : Thermal Conductivity of Solid Argon at Low Temperatures, 851
Woodward, Prof. R. B. : Elected a Foreign Member of the Royal Society, 827, 965 ; work of, 965
Woody Shoots : Auxin Transport in (F. G. Gregory and C. R. Hancock), 510
Wool : Staining of, by Bacterial Pigments (I. E. B. Fraser and A. P. Mulcock), 628
Wool Follicles in Sheep : Proposed Terminology for (Dr. Margaret H. Hardy and A. G. Lyne), 705
Wool Growth : Influence of the Adrenal Cortex on, and its relation to 'Break' and 'Tenderness' in the Fleece (H. R. Lindner and Dr. K. A. Ferguson), 188
Woolman, Dr. A. M. : The Prefix 'Nor' in Chemical Nomenclature, 1046
Word 'Protoplasm' (Dr. Garrett Hardin), 778
Wordie, J. M. : The International Geophysical Year—Geophysical Station at Coats Land, Antarctica, 598
Work, Dr. T. S. : *Obituary* of Dr. Harold King, 604
Work-hardening in Polycrystalline Metals : Relation between the Initial Instantaneous Extension in Creep and the Yield Stress and Coefficient of (Dr. Paul Feltham), 632
Workers : The Protection of, against Ionizing Radiations (International Labour Office), 212
Workers (Piggery) : Leptospirosis in (Dr. H. E. Seiler, J. Norval and Dr. Joyce D. Coghlan), 1042
Working Life : Optimal Span of, *review* by Prof. John Cohen, 449
World : Annotated Bibliography of the Bauxite Deposits of the (Elizabeth C. Fischer), 656
  Living Mammals of the (Ivan T. Sanderson), *review* by R. W. Hayman, 445
World (New) : A Bathynellid from the (Sebastian A. Gerlach and Rolf Siewing), 289
World Congress on Fertility and Sterility : Second (International Fertility Association), 693
World Energy Resources in the Light of Recent Technical and Economic Developments (Fifth World Power Conference), 692
World Government : Sixth Parliamentary Conference on, 1159
World Health Organization, and others : International Survey of Programmes of Social Development, 421
World List of Biological Periodicals during 1950–54, 734

World List of Scientific Publications : Fourth list of amendments to the third edition (Society of Chemical Industry), 1159
World Population and Resources (A Report by P E P), *review* by Maurice Kirk, 5
World Power Conference : Fifth (World Energy Resources in the Light of Recent Technical and Economic Developments), 692
World Symposium on Applied Solar Energy, 110
Wormald, Dr. H. : *Obituary* by Dr. R. V. Harris, 649
Wormall, Prof. A. : Elected a Fellow of the Royal Society, 559
Wormell, Dr. T. W. : Cloud Physics, 321
Worms : Locomotion of (W. B. Yapp), 614 ; (Dr. Betty I. Roots), 615
Worms (Glacier-), in New Zealand : So-called (Prof. N. E. Odell), 534
Wormwell, Dr. F. . Given an award from the Sir George Beilby Memorial Fund, 507 ; work of, 508
Worth (R. H.) Prize for 1955 of the Geological Society of London awarded to James Wright, 1065
Worth (R. H.) Prize for 1956 of the Geological Society of London awarded to Dr. C. T. Trechmann, 1065
Wound Contracture (Incomplete), and the Phenomenon of Hair Neogenesis in Rabbits' Skin (Dr. R. E Billingham and Dr. P. S. Russell), 791
Wrenshall, Dr. G. A., and others : Effects of Pituitary Growth Hormone on the Insulin and Hyperglycæmic-glycogenolytic Factor- extractable from the Pancreas of Obese-Hyperglycæmic Mice, 1235
Wright, A. E. : Appointed geologist, Tanganyika, 1207
Wright, Dr. C. A. : *Bulinus* (*Pyrgophysa*) *forskalii* (Ehrenberg) as a Vector of *Schistosoma haematobium*, 43
Wright, D. W. : Appointed a recognized lecturer (attached to the Department of Zoology) at the University of Birmingham, 876
Wright, E. M. (Hardy, G. H., and) : An Introduction to the Theory of Numbers, third edition, *review*, 301
Wright, Prof. G. Payling . *Obituary* of Prof. H. Oertel, 458
Wright, James : Awarded the R. H. Worth Prize for 1955 of the Geological Society of London, 1065
Wright, Joyce M. : Production of Gliotoxin in Soils, 896
Wright (Orville) Prize of the Royal Aeronautical Society awarded to K. W. Gunn, 919
Wright, Prof. Samson : *Obituary* by Prof. C. A. Keele, 732
Wright, Prof. Sewall : Awarded the Kimber Genetics Award of the National Academy of Sciences, Washington, 924 ; work of, 925
Wright, S. T. C., and others : Immunological Methods in Plant Taxonomy, 573
Wright, Prof. W. D. : The Theory of Stereoscopic Transmission and its Application to the Motion Picture, *review*, 202
Wunderly, Dr. Ch. : Control of the Staining Procedure after Paper Electrophoresis, 586
Wyart, Prof. J. : Documentation of Applied Chemistry, 168
Wye College : Appointment of Dr. G. P. Wibberley to the University of London readership in agriculture with special reference to agricultural economics, 1017
Wyllie, Dr. G. A. P. : Theoretical Physics, 269
Wynn, A. H. A. : Momentum of Decline of the Coal Industry, 514
Wynne, Dr. A. M. : Chemistry of Phospholipids, 21
Wyrobek, Dr. S. : Improvements in Seismic Prospecting, 1210

X-RAY Data (New), on Coals (L. Cartz, R. Diamond and P. B. Hirsch), 500
X-ray Mass Determination in Cells by Scanning (Bengt O. H. Rosengren), 1127
X-Ray Method (Flying-Spot) : Microanalysis by a (Dr. V. E. Cosslett and P. Duncumb), 1172
X-Ray Microscopy and Microradiography (International Union of Pure and Applied Physics Symposium on), 1065
X-Rays : Dominant Lethality induced by, in Haploid and Diploid *Saccharomyces cerevisiae* (M. E. Owen and R. K. Mortimer), 625
  Effects of Single and Fractionated Doses of, on Mouse Embryos (Dr. Robert Auerbach), 574
  Genetic Effects of, in relation to Dose-rate in *Drosophila* (Dr. A. M. Clark), 787
  Mechanism of Inactivation of Tobacco Mosaic Virus by (Max A. Lauffer, David Trkula and Anne Buzzell), 890
  Sensitivity of the Mouse Testis to the Mutagenic Action of (Dr. C. Auerbach and Dr. B. M. Slizynski), 376, 934 ; (Dr. A. J. Bateman), 934
Xanthates : Electronic Structures of Dithiocarbamates and (Dr. J. Chatt, L. A. Duncanson and L. M. Venanzi), 1042
Xanthin : Utilization of, by Mould Fungi (Dr. E. D. M. Taha and M. Mokhtar Sharabash), 622
Xeros, N. : Zymogen Formation in the Mouse Pancreas, 843
Xylan : Decomposition of, by *Sporocytophaga myxococcoides* (L. H. Sørensen), 845

YAGI, Dr. Kunio, and others : Inhibitory Action of Chlorpromazine on the Oxidation of D-Amino-Acid in the Diencephalon Part of the Brain, 891
'Yaku-sugi' Trees, 569
Yapp, W. B. : Re-appointed a member of the National Parks Commission, 167
  Locomotion of Worms, 614
Yapp, Prof. William Wodin, and Nevens, Prof. William Barbour : Dairy Cattle, fourth edition, *review* by Arthur S. Foot, 55
Yardley, H. J. (Blainey, Dr. J. D., and) : Electrolytic Desalting with Ion-Exchange Membranes, 83
Yarner Wood Nature Reserve, 611
Yarns and Fabrics · New (Forty-first Annual Conference of the Textile Institute), 693
Yeast : Mating Reaction in (J. D. Levi), 753
Yeast (Resting) : Incorporation of Adenine and Uracil into Ribonucleic Acid during Enzyme Induction in (Prof. H. Chantrenne), 579
Yeast Cells from Naked Protoplasts : Regeneration of (O. Nečas), 898
Yeasts : Cytoplasmic Structures in (Marion A. Williams, Prof. Carl C. Lindegren and Akira Yuasa), 1041 ; (Prof. Boris Ephrussi, Piotr P. Slonimski and Y. Yotsuyanagi), 1041
  Splitting of Aesculin by (J. A. Barnett and Dr. T. Swain), 133
Yelf, J. D. : Appointed senior agricultural officer, Fiji, 1112
Yerkes, Dr. Robert M. : *Obituary* by Sir Solly Zuckerman, 605
Yield from Rubber Trees : Stimulation of (E. D. C. Baptist and P. de Jonge), 1073
Yield Stress of Clay-Water Systems (Dr. A. Packter), 144
Yield Stress and Coefficient of Work-hardening in Polycrystalline Metals : Relation between the Initial Instantaneous Extension in Creep and the (Dr. Paul Feltham), 632
Yoffey, Prof. J. M. : The Pathogenesis of Poliomyelitis, *review*, 450
  The Neurohypophysis, 1020
Yonge, Prof. C. M. : Marine Biology—Symposium at the Scripps Institution, 1212
Yorkshire Council for Further Education, and others : Symposium and Exhibition on Radiochemistry, 167
Yoshida, S., and others : Search for Point Source of Cosmic Rays, 35
Yotsuyanagi, Y., and others : Cytoplasmic Structures in Yeasts, 1041
Youle, P. V., and others : Cyclic Polyamides from Nylon 6 and 6 6 Polymers—Constitution of the Cyclic Polyamides isolated from Nylon 66 Polymer, 128
Young, Dr. W. (Iball, Dr. J., and) : Structure of 3 : 4-Benzpyrene, 985
Young, Prof. F. G. : Inter-University Council for Higher Education Overseas, 405
  Progress in Biophysics and Biophysical Chemistry, *review*, 447
  Lucubratory Biochemistry, *review*, 544
Young, J. E. R. : Spectroscopy, 737
Young, Prof. J. Z. : Origin of the Vertebrates, *review*, 764
  Obituary of Dr. A. G. Lowndes, 826
Young, Prof. J. Z., and others : Studies in Communication contributed to the Communication Research Centre, University College, London, *review* by Prof. G. Patrick Meredith, 446
Young Naturalist : Letters to a (Maxwell Knight), *review*, 300
Young People : Citizens of Tomorrow, a Study of the Influences affecting the Upbringing of (King George's Jubilee Trust), 149
Younger, D. R. : Appointed manager, Yumdum Experimental Farm, Gambia, 561
Yourgrau, Dr. Wolfgang, and Madelstan, Stanley : Variational Principles in Dynamics and Quantum Theory, *review*, 1053
Ypsilantis, Dr. T., and others : Antiprotons, 11
Yuasa, Dr. Akira : Nucleus and Spindle of *Bacillus megatherium* in Fission and Sporulation, 386
Yuasa, Dr. Akira, and others : Cytoplasmic Structures in Yeasts, 1041
Yumdum Experimental Farm, Gambia : Appointment of D. R. Younger as manager, 561

ZACHERL, Prof. Michael K. (herausgegeben von Hecht, Prof. Friedrich, und) : Handbuch der Mikrochemischen Methoden, Band 2, Verwendung der Radioaktivität in der Mikrochemie ; Radiochemische Methoden der Mikrochemie (Dr. E. Broda und Dr. T. Schönfeld) ; Messung Radioaktiver Strahlen in der Mikrochemie (Dr. T. Bernert, Dr. B. Karlik und Dr. K. Lintner) ; Photographische Methoden in der Radiochemie (Dr. H. Lauda), *review* by Prof. F. A. Paneth, 953
Záhor, Z (Parizek, J., and) : Effect of Cadmium Salts on Testicular Tissue, 1036
Zaidi, Dr. S. M. A. : The Neurohypophysis, 1020
Zajicek, Dr. Joseph (Giacobini, Dr. Ezio, and) : Quantitative Determination of Acetylcholinesterase Activity in Individual Nerve Cells, 185

DIFCO

BACTO-CEPHALIN CHOLESTEROL ANTIGEN

For Hanger Flocculation Test

An approved and stable reagent for use in the Hanger Flocculation Tests to determine disturbance of liver function. Available in packages of six units, each unit equivalent to 150 ml. final test antigen.

Hanger: J. Clin. Invest. 18:261:1939.

BACTO-THROMBOPLASTIN

For Prothrombin Determination

A stabilized rabbit brain substance for use in determining the Prothrombin Time of Blood. Bacto-Thromboplastin is applicable to the procedures described by Quick, Link-Shapiro, Smith, et al., Kato and Poncher, and other tests requiring a potent thromboplastin. Each box of Bacto-Thromboplastin contains 6 ampoules, sufficient for 210 Quick determinations or 420 Link-Shapiro determinations.

THE FARADAY SOCIETY
A GENERAL DISCUSSION on
MEMBRANE PHENOMENA
will be held at **The University of Nottingham, from the 10th-12th April, 1956**

The Discussion, which is being arranged by the Colloid and Biophysics Committee of the Faraday Society, will be confined to some Compact and Microporous Membranes and will be sub-divided into the following sections :—

I. THEORY OF MEMBRANE PHENOMENA.
II. PROPERTIES AND APPLICATIONS OF PARTICULAR MEMBRANES, SUCH AS : OIL FILMS, COLLODION, CELLOPHANE, CLAY, KERATIN AND ION EXCHANGE RESINS.
III. BIOLOGICAL MEMBRANES.

A GENERAL DISCUSSION on
THE PHYSICAL CHEMISTRY OF PROCESSES AT HIGH PRESSURES
will be held at **The University of Glasgow from the 20th-21st Sept., 1956**

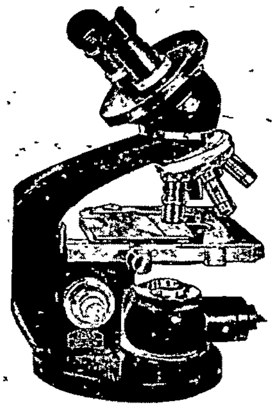
THE Discussion will be confined to the physico-chemical processes at high pressures at both low and high temperatures and will be sub-divided into the following sections :—

I. THEORETICAL.
II. EQUATIONS OF STATE, PHYSICAL PROPERTIES AND THERMODYNAMIC TRANSFORMATIONS.
III. CHEMICAL REACTIONS AND TRANSFORMATIONS.
IV. DETONATION AND OTHER COMPRESSION WAVE PHENOMENA.

Full particulars regarding application for accommodation and preprints will be issued in due course. The Faraday Society, 6 Gray's Inn Square, London, W.C.1.

CARL ZEISS

W MODEL MICROSCOPE



The pre-eminent instrument. Integral illumination. Pre-centred condensers. Immediate change from bright field to phase contrast. Optovar magnification changer.

SCIENTIFIC PAPERS AND SCIENTIFIC LANGUAGE

THE recent report on "Science in the U.S.A. in 1954", issued by the British Commonwealth Scientific Office, North America, directed attention to the interest now being taken in mechanical translation in the United States. A research group at the Massachusetts Institute of Technology is compiling a bibliography on this subject, and one at the Battelle Memorial Institute is seeking to construct a mechanical dictionary which would permit word-by-word or literal translations to be made. The possibility of producing grammatical English translations of selected Russian sentences using an electronic data processing machine has already been demonstrated at the Institute of Languages and Linguistics, Georgetown University; in Great Britain Mr. B. C. Vickery made some comments on the subject in his paper before the Library Association at Southport last September, in discussing the language barrier in science.

More recently, the tenth report of the Nuffield Foundation, in recording the offer of a grant of £7,200 over three years to Birkbeck College, University of London, to support the work carried out by Dr. A. D. Booth, head of the Computational Laboratory there, on mechanical translation, indicates the importance attached by the Foundation to the possibilities opened by the digital computer in translation from one language into another.

This project arose out of the work done in recent years on the development of the electronic computing machine at Birkbeck College under Prof. J. D. Bernal. When this project was first considered, attempts were made to use only those words which can be found in a dictionary; but it has since been found more practical and effective to separate the dictionary into two parts, one for stems and the other for endings, thus bringing the dictionary storage space required well within the capacity of the machine. A preliminary survey indicated that if some one thousand stems and the same number of endings are available, and if these are so chosen as to relate to one special subject, such as biophysics, X-ray crystallography, plant genetics or neurosurgery, addition of about a thousand words of common parlance will enable the machine to translate more than ninety per cent of the texts presented to it.

Here word-for-word translation is unsatisfactory, however, and to solve the problem of word-order, the grammatical structure of the language must be investigated in detail and micro-glossaries—stem-ending dictionaries in the specific subject—must be compiled and coded. Investigation of the adaptability of the machine to tabulate alternative meanings, and the possibility of achieving a literary quality in the end-product has already led to a satisfactory way of handling idioms being evolved. Although it requires a larger storage capacity than is at present available, Dr. Booth is optimistic that even the problems of machine-translation of literary work may prove less complex than they at present appear, and it is expected that the machine will ultimately be able to translate 3,000 words an hour.

How far such developments can be used for dealing with the problem of communication between the scientist and the non-scientist cannot yet be judged; but it is possible that ultimately they could offer some contribution to overcome the difficulty of 'scientific language' which has been the subject of considerable debate since it was discussed by the Parliamentary and Scientific Committee early in November. Meanwhile this research has stimulated work on a further project, that of 'recognition' of texts by the computer, so that it can 'read' or 'take dictation'. For mechanical translation to be useful, the machine must be able to absorb the texts by either sound or sight, otherwise the cost will be prohibitive.

These projects are, however, only one of the ways in which new grants from the Nuffield Foundation during the past year are assisting the solution of problems of human communication. There is at present no organization for collecting and disseminating bibliographical information on the social sciences as a whole and, in particular, on peripheral subjects. To improve the bibliographical organization in this field, which has lagged much behind the development of research in it, the Foundation has made a grant of £2,500 a year for three years in the first place to the International Committee for Social Science Documentation. The National Book League will administer the grant and provide accommodation for the research, the aim of which is to produce good bibliographical tools by elaborating a series of consistent schemes or recipes which will facilitate the provision of abstracts or bibliographies in this field, while keeping duplication to the minimum and ensuring that contributions on peripheral subjects are not overlooked. A survey will be made, in London in the first instance, of the adequacy of the existing library and research facilities for social scientists, and it is hoped that, as a result, similar surveys will be made for other regions.

Such a project, by recording, for example, the location and availability of certain categories of matter, provides a firm basis for co-operation between librarians in improving the resources of their libraries for social scientists. As such it may be said to contribute to the improvement of the marshalling yards and dispersal places of knowledge, if we may adopt the analogy with transport which Mr. R. H. Coats recently used in discussing human communications. On that same analogy, the work on mechanical translation contributes to the improvement of the assembly places of knowledge or the effectiveness of contact with those who wish to use it.

Yet another new grant made by the Nuffield Foundation last year in this field of human communication, which is of special interest to the scientist, is concerned with the medium which is used for communication. The Foundation has been examining in some detail the best way of assisting the learned journals, many of which are to-day in acute difficulty. Mostly these difficulties are economic, resulting from the sharp rise in the costs of paper, printing, accommodation and staff since the end of the War, while the equivalent general rise in the cost of living makes it very difficult to raise subscriptions to the necessary level. Moreover, the changes proposed in the postal rates for printed matter and parcels in the autumn budget threaten to make the position in 1956 onwards acutely difficult for many learned societies which seek to further the spread of technical or scientific knowledge. The Textile Institute, for example, which already spends more than £30,000 a year on the publication of its *Journal*, will now have to find an additional £1,000 for distribution charges. Nor does the effect end there. Libraries and institutions are equally affected by these higher postal rates, and the sums available for subscription to such periodicals or for the circulation of copies are proportionately diminished.

The Foundation recognizes that the learned periodicals vary enormously in the strength of their endowment, the size of their circulation, and the potential increase of their circulation by use of sound professional methods. Its examination of the publishing and distribution techniques of the learned periodicals has indicated the existence, on the whole, of a conservative attitude towards new printing processes and sales methods. A few have adopted type-photo-offset and similar formats, with an approximate saving of twenty per cent in printing costs. Production economies in size of margin or type, or even quality of paper, have scarcely been considered; and no group of periodicals seems to have examined the economies that might be achieved by bulk-buying of paper or the increased sales which might result from an attractive but still dignified cover. Although the rise in production costs is now less marked, there is little prospect that costs will drop below their present level in the near future. The only hope of narrowing the gap between costs and returns seems to lie in improving the technique of production and sales, and in some measure of centralization of effort.

However strong a case could be made for government assistance to some particular periodical—certainly a strong case could be argued in respect of postal charges on all learned periodicals—that case can scarcely be presented until the possibilities just indicated have been fully explored. It is welcome news, therefore, that the Nuffield Foundation has set aside a sum of £43,750 over five years to be spent on the support of journals in fundamental subjects. The British Academy and the Royal Society have been informed that a sum of £8,000 a year will be available for that purpose during the next five years, and that a further sum up to £750 a year will be set aside for the payment of any professional advisory fees that may be necessary.

The distribution of the grant will be entrusted to two special committees, one for the humanities, appointed by the British Academy, and one, appointed by the Foundation in consultation with the Royal Society, for the scientific periodicals. Each grant will be on a yearly basis, and no periodical will be supported unless, in the opinion of the allocating committee, it is doing all within its power to make its economic position stable or else is prepared to accept and act upon the advice offered by a panel of advisers. This panel will comprise a small number of highly experienced commercial publishers and printers invited to serve by an executive liaison committee, consisting of the Secretary of the British Academy, the Assistant Secretary of the Royal Society, and the Director of the Foundation, which will review, year by year, the distribution of funds between the Royal Society and the British Academy. Mr. Robert Lusty is already carrying out for the Foundation a pilot survey of the publishing and distribution practices of the learned periodicals.

The Nuffield Foundation is thus assisting an attack on this problem of communication of knowledge in three different fields, and the cumulative effect of the several projects may well be considerable, particularly in the light of the climate of opinion revealed at the first International Congress on Documentation of Applied Chemistry in November. At that Conference, Dr. R. S. Cahn, for example, speaking on the role of the professional and learned societies, suggested the reorganization of publishing methods and cuts in costs, along with an attempt to secure greater support from industry and a users' conference, while mechanical methods in documentation generally were summarized by Dr. E. Pietsch, director of the Gmelin Institute. Moreover, the current discussion on scientific language is of fundamental importance, for the full benefit of mechanical aids and modern methods of production and distribution will only be realized as the content of the paper is adapted to its purpose—that is to say, as it is expressed in language which conveys fully and clearly the ideas in the mind of the writer to the particular type of reader he wishes to address.

That lies at the heart of the argument about scientific language. The scientist has a duty to make himself comprehensible to the readers or audience he wishes to address; and the choice of words is a matter of sense, not of arrogance—of choosing the tools appropriate to the job. It should not be confused with the question of education, even if the education which the scientist himself has received or the character of public education generally is involved. But it is worth bearing in mind that the maxim of Bentham which Dicey included more than fifty years ago among the four points he laid down for the expression of thought is still valid: one word for one thing; another word for another thing—this is the whole secret of style. If scientists consistently remembered with this even one of Dicey's own maxims—that arrangement of thought, more than anything else, is the secret of a good style—many of our difficulties in the communication of knowledge would be greatly simplified, and we should be in a stronger position to reap the full advantages from the new developments which the Nuffield Foundation is helping to explore.

SIMON STEVIN—A FOUNDER OF MECHANICS

The Principal Works of Simon Stevin

Edited by Ernst Crone, E. J. Dijksterhuis, R. J. Forbes, M. G. J. Minnaert and A. Pannekoek. Vol. 1: General Introduction; Mechanics. Pp. v+617. (Amsterdam: C. V. Swets and Zeitlinger, 1955.) 52 guilders.

SIMON STEVIN or Stevinus or Stevens, for the name occurs in all three forms, is probably best known to the general student of the history of science from the attention given to his fundamental work on statics in Mach's celebrated history of mechanics. Some index of his importance is that Lenard includes him in the forty-odd biographies that make up his "Grosse Naturforscher". In particular, Stevin is symbolized by the inclined plane surrounded by a closed chain of spheres, with the inscription: *Wonder en is gheen wonder*—a marvel and yet no marvel. Arguing from this and the impossibility of perpetual motion, which he took as an axiom, he deduced the force required to keep a smooth body in equilibrium on an inclined plane and used this as the basis of his investigations into the laws of statics, including the parallelogram of forces, by the aid of which he solved quite complicated problems concerning weights supported by connecting strings. He carried out important work on hydrostatics, including the establishment of Pascal's paradox, that the pressure on the base of a vessel containing a liquid depends only on the depth, and in no way on the form of the vessel, with the familiar consequences for communicating vessels. He also treated the stability of floating bodies—"floating top-heaviness", as he called it.

However, this is but a small part of Stevin's performance. His work on arithmetic and algebra earned him an honourable place in Cantor's "Geschichte der Mathematik". He was the first to introduce the systematic use of decimal fractions, but with a clumsy notation, and he advocated the general use of the decimal system in coinage, weights and measures. His very rare little tract on terrestrial magnetism, "De Havenvinding" (1599), translated at the time into English under the title "The Haven-finding Art", contains valuable records of the magnetic declination, which he proposed to make a basis of navigation. As adviser in scientific and technical matters to Prince Maurice of Nassau, he was extensively concerned with many aspects of engineering, in particular with matters of drainage and hydraulic engineering generally. He was a leader of the Dutch school of fortification which arose early in the seventeenth century. On all these practical matters he wrote extensively. Among his inventions was a sailing chariot, long one of his most popularly celebrated achievements, which comes in for comment in "Tristram Shandy". He was, above all things, an experimenter, and his fundamental experiment on the time of fall was both earlier and more conclusive than that of Galileo. He let fall together two spheres of lead, one ten times heavier than the other, from a height on to a board. The sounds of impact were simultaneous. He was quite clear on the part played by air resistance in the fall of light bodies.

The fame of Stevinus was much hindered by the fact that, for reasons of principle, he published the greater part of his work in the Dutch language, on the history and merits of which he wrote extensively, and sometimes fantastically. He was for this reason little read outside the Netherlands until the posthumous appearance of an important part of his work in French. An accessible and critical edition of his work has thus long been desirable.

This volume under review is the first of a new edition of the "Principal Works of Simon Stevin", which is being produced by the Koninklijke Nederlandse Akademie van Wetenschappen, with the financial support of several Dutch organizations interested in learning. The complete works are not contemplated, both because of the forbidding bulk and because several of them are not of sufficient originality or interest to demand reprinting. This first volume bears the general description "Mechanics" and is edited by E. J. Dijksterhuis. It contains "De Beghinselen der Weeghconst"—"The Elements of the Art of Weighing"—which includes the work on statics already referred to, and "De Beghinselen des Waterwichts"—"The Elements of Water Pressure" (that is, of hydrostatics). The Dutch text is given in facsimile on the left-hand page and an English translation, by Miss C. Dikshoorn, on the right—an excellent arrangement. So far as I know, this is the first English translation, and the French translation, by Albert Girard, issued in 1634 as part of a large folio, the "Œuvres Mathématiques", leaves out certain parts that the editor thought of little interest. This is, then, clearly the text that the student requires. Considering the present eclipse of classical learning, it might have been well to furnish a translation of the Latin and Greek prefatory verses by Jan de Groot.

The book is prefaced by an introduction giving the scanty facts known of Stevin's life and a sketch of his work. There is also a bibliography which cannot be said to be very satisfactory, a comment which needs no amplification in face of the frank admission: "For readability's sake no attempt at bibliographical correctness has been made". The books in question are so rare—of one booklet the only copy then extant was lost when the library at Louvain was burnt in 1914—that a full and conventional bibliographical description would have been appropriate.

The undertaking so well launched is sure of a warm welcome from all students of the history of science, and the future volumes are awaited with pleasant expectation.

E. N. da C. Andrade

THE OUTLOOK FOR MAN

The Foreseeable Future

By Sir George Thomson. Pp. viii+166. (Cambridge: At the University Press, 1955.) 10*s.* 6*d.* net.

THIS book is not so much about the future of mankind as about the tools which man is likely to possess for shaping his future during the next few decades and the technical limits within which the advance of civilization is possible. In non-technical language Sir George Thomson first explains clearly the scientific principles which will determine the broad lines of technological progress; and then, in a series of fascinating chapters, he shows even the non-technical reader just how these principles of impotence, as he terms them, set the limits to the increase of supplies of energy and its more effective utilization, to the exploitation or improvement of the materials available for us, to our powers of handling very complex problems (for example, by means of the new electronic digital computers) and to the great extension in biological knowledge. These are the four fields in which he anticipates the major advances of the future, and the possibilities are indicated realistically as well as with vision.

The chapters in which this is done for energy and power, for materials, for transport and communications and for meteorology are the best in the book. Those on food and on some applications of biology are equally imaginative but are sometimes less convincing, and some of his suggestions may be open to challenge. Where Sir George's predictions do not lend themselves to interesting discussions, they should go far to correct unreasonable expectations, as, for example, when he discusses the prospects and implications of nuclear energy. He sees limits to the extension of television for entertainment, but discusses its possibilities in regard to business communications and also gives reasons for believing that the practical limits of speed in transport have now been reached. It will surprise some to find the Master of Corpus Christi College, Cambridge, discussing space travel seriously, even if he thinks it unlikely to yield practical advantages which will offset the many technical difficulties. Climatic change is also regarded as a serious possibility, whether by the production of artificial rain or by the biological method of growing plants in desert areas and so obtaining the absorption of radiation by the ground.

Here, at least, Sir George reflects that schemes of this kind may have to wait for a world government; but when he discusses food and the applications of biological science, he is apt to disregard the social, moral and political factors which are involved in the prospects he expounds so imaginatively. He does not expect that any one line of advance will supply the complete answer to feeding the world's growing population; but he predicts that, in the long run, plants, moulds and bacteria bred for the purpose will compete successfully with the chemist in making some of the more complicated compounds, and he looks to a large increase in synthetic foods, particularly for feeding cattle, for which purpose he suggests they may be delivered automatically at distributing centres. Improvements in plant and animal breeding will also make a big difference to agriculture and to the world's supply of food. On the population question as a whole, however, his most interesting suggestion is that medical research should concentrate increasingly on the prevention, and at first the postponement, of old age rather than on the further reduction of the killing diseases.

One interesting possibility he suggests is that domestication of the monkey could put at man's disposal for crop picking a combination of hand and eye through a moderately intelligent brain that is one of the best bargains Nature has to offer us. When, however, he comes to discuss the social consequences of technological advances, Sir George is less satisfactory and convincing. He admits that civilized man is at present rather like a child who has been given too many toys for his birthday; but none the less he seems to lay all the stress on the tools rather than on the men and women who use them. In the transformed and enriched world he contemplates, there appears to be no real place for values. His treatment of thought is purely materialistic and leaves no room for art, religion, patriotism, humanitarianism or the like. There is no apparent recognition in this book that even the advance of science and technology does not depend simply on material conditions but on such values as freedom of thought and investigation and tolerance, for example, the future of which depends ultimately on ideas and man's spiritual outlook.

Such conditions and ideas, far more than nuclear power, the electronic computer or biological advances, may yet determine the extent and pace of mankind's development, or indeed whether civilization continues and does not collapse; and it is for this reason that there is a certain naïvety about some of the discussion in this book of social questions, as when, for example, Sir George is worried about the consequences of the elimination, by mechanization or automation, of routine work and the onus of finding work for the more stupid and also the more rapidly multiplying part of the population. The solutions, he suggests, involve moral judgments, and in this field the rate of advance is apt to be set not so much by what is technically possible as by what is politically and socially feasible.

Here, of course, we enter on the question of education, on which Sir George has some interesting comments, even if sometimes, as when he refers to the release of man's brains from past hindrances and to the possibility of biological improvements, he seems to be reaching into a very distant if not a doubtful future. He visualizes a much larger proportion of people engaged on work which demands some training in science, and he recognizes the dangers of specialization and the increasing difficulty of acquiring width of knowledge. He stoutly champions the interpreter or expositor of scientific and technical knowledge, and however much one may wish that Sir George had dealt adequately with the human values, the book at least establishes his own claims as an expositor of the first order.

TECHNOLOGY OF SOUND

Sonics

Techniques for the Use of Sound and Ultrasound in Engineering and Science. By Theodor F. Hueter and Prof. Richard H. Bolt. Pp. xi+456. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1955.) 80*s*. net.

SOME years ago I was asked by a farmer the best method of improving his wheat crop recently harvested. He had read in the press that it is possible to refine grain by the application of ultrasonic power! Information on the applications of acoustic vibration in processing, analysis and instrumentation has only been available to the reader of a large assortment of journals, and to those fortunate people having access to the classified literature of the research establishments of the Armed Services. It is not surprising that these techniques have been hailed in not too well-informed quarters as the panacea of all evils. This is doubly unfortunate because it has led to more than the occasional attempted application where a more thorough knowledge of the physical limitations would have precluded the attempt. It has also meant that particular applications have not always been investigated sufficiently to determine their full technical and economic promise. The book under review should do much to help those interested in techniques for the use of sound and ultrasound in science and engineering.

'Sonics' is defined by the authors as "the technology of sound as applied to problems of measurement, control and processing". The authors wisely ignore the usual division of acoustics into sound and ultrasound, which is of no significance in this technology. The first three chapters of the book are concerned with establishing in some detail the fundamentals of vibration and sound, and of radiation. Here we find an introduction to such concepts as acoustic analogy, acoustic impedance, reflexion and transmission, energy density and intensity, radiation pressure, the decibel scale and diffraction. In Chapters 4 and 5 the principles and design of piezoelectric and magnetostrictive transducers are considered. Chapter 5 is particularly useful in that it summarizes in some detail much that has not been readily available.

The remainder of the book deals with the three facets of the technology—power or processing applications, testing and analysis of fluids and materials, and instrumentation and control. Information is given on the physical principles involved in processing and the practical design of transducers. This latter covers, as well as the transducers already considered, electrodynamic, fluid dynamic and siren sources. There is a useful section on cavitation. Under testing and analysis, the various methods at present available for determining the propagation velocity and attenuation are discussed, as is also the relation of these quantities to the physical properties of the medium. A mainly theoretical appendix effectively summarizes our knowledge of acoustic relaxation mechanisms in fluids.

It should be emphasized that the authors have attempted to discuss the general principles of the technology rather than to consider all known applications. This approach should be of greater value. In their presentation they have sought to steer a middle course between a script intelligible only to the advanced physicist and one dealing with technical details of specific designs. They have also assumed little knowledge of acoustics proper, but some understanding of electronics. Substantially, they have succeeded in their plan by using a relatively simple presentation and recourse to intuitive arguments, with the addition of footnotes and sections in small type to augment the discussion. The inclusion in the book of design tables, graphs and formulæ, together with practical instructions, considerably increases its usefulness. The M.K.S. system of units is used; but other units are also indicated on some graphs and tables. Tables for the conversion of units from one system to another are included. Many references to the literature are given, including those to extensive bibliographies. It has been a pleasure to read and review this book.

H. D. Parbrook

LAND AND PEOPLE: 1955–80

World Population and Resources

A Report by PEP. Pp. xxxvii+339. (London: Political and Economic Planning, 1955.) 30s. Distributed by George Allen and Unwin.

THE Demographic Revolution has joined the Agrarian Revolution and the Industrial Revolution as a significant mechanism of change in the course of human history. Whether one regards it as an embarrassment in a specific historical situation is largely a matter of one's political or national affiliations, but it remains a fact to be faced. In this report Political and Economic Planning (PEP) discusses the wide range of problems attendant upon the almost inevitable increase of 25 or 30 per cent in the world population (now estimated at 2,500 million) within the life-time of an already adult generation. Many have said that this generation is frightening itself with phantoms of Neo-Malthusianism which the next generation will exorcise using the formulæ of nuclear energy, algæ culture, watered deserts, and the rapid diffusion of 'Western' standards of 'social responsibility' through Africa and Asia. Political and Economic Planning, however, does not anticipate that any significant new technological contribution will alleviate a deteriorating situation during the twenty-five years ahead. It recognizes, of course, that fundamental discoveries are being made, but argues in terms of distribution and costs to the peasant whose income is only a fraction of our own.

The ecology of human societies embraces the mastery of techniques of production and distribution, and of social organization. In assessing the balance of populations against their respective resources, one can scarcely avoid finding that solutions to specific problems are not judged by scientific standards alone, but also in terms of politics and morals. It would be very convenient if the willing gift of mortality control to the under-developed lands were acknowledged by equally willing acceptance of fertility control, but there are ancient prejudices to be overcome. A highly urbanized society with a high standard of living moves spontaneously towards low fertility; the most immediate problem is the control of fertility in illiterate rural societies. Mortality control finds ready and public acceptance; but fertility control remains a sensitive and controversial issue for the individual. Here is the basic social problem.

Theories of control based on the 'rhythm' method can be viewed against the account given here of the difficulties of teaching it in an Indian village. Interested readers might refer to the Milbank Memorial Fund Report for 1954 for a considered statement and discussion of the Catholic attitude. Incidentally, the Marxist thesis that there is no population problem, only a social problem, and that every mouth brings with it a productive pair of hands, is considered and rejected. In brief, Political and Economic Planning is not optimistic about the prospects of the poor and densely populated countries combining a stable population with an increasing standard of living in any future we can usefully consider. It couples recognition of the values of family and social responsibility with an appeal to biologists to work energetically (and with increased support!) towards the new philosopher's stone, an oral contraceptive which is cheap, effective and acceptable to all creeds and cultures.

The report falls into three major sections: a general survey of population and resources, a series of comparative studies of countries at various stages of economic and demographic development, and thirdly, a study of "Nation and Family" in the context of attitudes towards fertility control. The whole provides an extremely valuable summary of the most useful facts (closely up to date), clearly arranged and leading to a carefully accurate review of the problems and issues at stake. Discussion throughout is brief to the point and realistic, and based on authoritative sources and opinion. Its value as a text for students will be enriched if read along with Prof. W. A. Lewis's important chapter on "Population and Resources" in his recent "Theory of Economic Growth".

Maurice Kirk

Into the Blue

The Lake Tana Expedition. By Lionel Ferguson. Pp. 255+16 plates. (London: William Collins, Sons and Co., Ltd., 1955.) 16*s*. net.

NUMEROUS undergraduate expeditions have gone, either privately or under the auspices of clubs such as the Oxford University Exploration Club, to many parts of the world in recent years. Their success generally depends upon the adequacy of their preparation and organization, the nature of the guidance received from individuals and from institutions like the Royal Geographical Society, the assistance given by governments and commercial firms, and, above all, upon the enterprise and determination shown by the individual members. Success came to this party of five Cambridge undergraduates —three geographers, a historian and an economist— because their expedition showed signs, in varying degrees, of all these requirements.

As an expedition to undertake a geographical survey in the Lake Tana area of Ethiopia it failed, since barely two out of the eighteen weeks of the expedition could be spent there. Thus its 'findings' are superficial and of no scientific value, which is unfortunate, for there must be a wealth of unrecorded material in the region. The party met with a long chain of misfortunes, including frequent mechanical trouble with their car, and the withholding of official permission to follow certain routes across the Sudan. All types of people, whatever their colour, status or wealth, showed great kindness and gave much practical help, both before and during the expedition. From the geographer author one might have hoped for more about the landscape and the people of the areas through which the party travelled in three continents; and the accounts of the social contacts of the several lengthy enforced halts might have been considerably shortened.

But any blemishes of content, like those of style, are insignificant alongside the many traces of the perseverance and determination of these five young men who overcame so many difficulties, actual and political. They fully deserve the kind words of Sir Brian Robertson who, having met them in Cairo, contributes a foreword. "To travel is always good," he writes, "but to travel hard and far on little money and in limited time is first-class education."

R. W. Steel

Some Fundamentals of Petroleum Geology

By Dr. G. D. Hobson. Pp. x+139. (London: Oxford University Press, 1954.) 18*s*. net.

THIS book descends to basic principles of petroleum in no uncertain manner. It is not, however, a recapitulation of time-honoured theories of origin, migration and accumulation, for this, as the author observes, "has already been written many times in the voluminous literature on this subject". Dating the industry from Drake (1859), if we consider all happenings since then—the enormous, world-wide, technical evolution, with its vast ramifications and impacts on the progress of mankind—then it is incongruous that to questions of oil-genesis, mechanism of mobility and factors governing its selection of resting places, answers are still tentative, especially concerning beginnings.

In my experience, most authors of 'petroleum geologies', while proclaiming their own fancies, sooner or later return to conventional treatments of prevalent theories, discarding some from now accepted weaknesses, and then forsaking the reader to sort it all out for himself. This tendency to leave things 'in the air' is the reason why, to-day, there is no scientific unanimity on vital issues. Dr. G. D. Hopson here steps in with a new broom, skilfully manipulated, to sweep away dead wood of unprofitable theory within a compass of five original and stimulating essays.

The first essay, "Nature of an Oil Accumulation", deals with reservoir rock, fluid distribution and final retention. "Reservoir Fluids: their Composition and Properties" follows, and next is "Origin of Petroleum", embracing conditions of formation; source-material; amount, distribution of organic matter; agents; and thermal, radioactive and biochemical transformations. "Migration and Accumulation", comprising buoyancy, interfacial tension, compaction and general mechanics of fluid movement and other conceptions, leads to a final dissertation on "Reservoir Pressure". This book is not only a critical survey of past controversial thoughts, but also an incitement to clearer thinking on this complex substance—petroleum—from which every oil technologist will benefit.

H. B. Milner

1er Symposium International de Bactériologie Alimentaire

Organisé par la Section de Microbiologie des Produits Alimentaires de l'Association Internationale des Sociétés de Microbiologie, Institut Pasteur de Lille, 10–14 Octobre 1954. Bactériologie des Semi-Conserves de Viandes—Rapports, Communications et Discussions. (Annales de l'Institut Pasteur de Lille—Vol. 7, 1955.) Pp. 266. (Paris: Éditions Médicales Flammarion, 1955.) n.p.

THIS symposium dealt with the bacteriology of non-sterile processed meats, participation being limited to specialists, invited from sixteen different countries. The volume gives a complete account of their scientific proceedings: sixteen substantial papers (reports), and nineteen shorter communications, with discussions. Seventeen of the papers are in English and fourteen in French; four in German are provided with English and French summaries. Major papers have reference lists.

The topics range over the whole subject. After definitions, and an exposition of characters desired by the user, several papers deal with the processes to which these products are subjected. Two papers surveying the whole bacterial flora are followed by several on the occurrence and significance of the important types of bacteria: *Cl. botulinum*, other clostridia, staphylococci, members of the Enterobacteriaceae, streptococci, lactobacilli, corynebacteria, micrococci, and the *Achromobacter–Pseudomonas* group. Next the bacteriological condition of ancillary ingredients like gelatin and spices is considered. Techniques used in different countries for the bacteriological examination of these foods are then compared, and the problems of representative sampling described. Finally, after discussion of the translation of such observations into bacteriological standards, there is a description of the bacteriological conditions generally agreed as desirable in canned ham.

Much of this information, especially that from overseas, is not readily available elsewhere. Because it is uniquely comprehensive, up to date and authoritative, the volume might be regarded as indispensable to all—from the manufacturer to the analyst and inspector—who are concerned with the bacteriology of such foodstuffs.

M. Ingram

SCIENTIFIC CENTENARIES IN 1956

By JOAN M. EYLES

THE ranks of well-known scientists have always included not only those who have made major contributions to their branch of science, but also those who have been responsible for some standard text-book, which has caused their name to become familiar to thousands of students. One of the earliest of these successful authors was John of Holywood, better known as Sacrobosco—the Latinized version of his name. A Yorkshireman by birth, he studied at Oxford and then taught mathematics in Paris. Sacrobosco flourished in the thirteenth century, and manuscript copies of his treatise on spherical astronomy, "Sphaera Mundi", must have been circulated widely. Two centuries later, the advent of printing greatly increased its circulation. The first printed version appeared at Ferrara in 1472, to be followed by another twenty-six editions before 1500, and fifty more in succeeding years. The last, bearing the Leyden imprint, was dated 1647. Sacrobosco wrote other treatises, including one on the art of numbering, which played an important part in popularizing the use of Arabic numbers. He died in Paris, and the year of his death is usually taken to be 1256.

Passing on three hundred years, we come to Luca Ghini, an Italian botanist who died on May 4, 1556. He was appointed "Reader in Dioscorides" at Bologna in 1527, and many of his pupils became famous, including Aldrovandi and the English botanist William Turner. Ghini is thought to have been the first to use dried plants for scientific purposes, and the earliest known herbaria, in the modern sense, were all made by his pupils.

Another botanist, who died a century after Ghini, was Walter How, born in London in 1620 and educated at the Merchant Taylors' School and at St. John's College, Oxford. How practised as a physician in London, and was the author of "Phytologia Britannica", which appeared anonymously in 1650. This has been regarded as the first British flora, though some local lists preceded it. How died when only thirty-six, on August 31, 1656, and was buried at St. Margaret's, Westminster.

During the Civil War, Walter How was captain of a cavalry troop on the side of King Charles. On the opposing side we find Edmund Wingate (1596–1656), mathematician and lawyer, who chose to support the Parliamentarians, although he had been tutor to Queen Henrietta Maria when she was a girl in Paris. Wingate's career bears some resemblance to that of Sacrobosco, for he too was a Yorkshireman, studied at Oxford and taught at Paris, and was also the author of some frequently re-printed books. His "Arithmetick made easy" achieved a nineteenth edition in 1760, although by that time it was so altered that it would scarcely have been recognized by its author. Wingate was member of Parliament for Bedford in 1650, and died in London in December 1656.

Jean Baptiste Morin (1583–1656), who in 1630 became professor of mathematics at the Collège Royal in Paris, has been called the last of the astrologers. His horoscopes were highly thought of, and he was consulted regularly by Cardinals Richelieu and Mazarin, receiving from the latter a handsome pension.

An eminent Italian of this period was Marco Aurelio Severino (1580–1656), who became professor of anatomy and surgery at Naples in 1610, and whose teaching drew students to Naples even from regions north of the Alps. His "Zootomia Democritae", published at Nuremberg in 1645, was the first comprehensive treatise on comparative anatomy. In the last section of this book he describes methods of dissection and recommends the use of the microscope, "invented in our life-time". He was in his seventy-sixth year when he died of the plague in Naples. His books, particularly the "Zootomia", are extremely rare.

The most important tercentenary of the year is undoubtedly that of the birth of Edmond Halley, the gifted mathematician, astronomer and pioneer meteorologist who is also remembered for the part he played in the production of Newton's "Principia". Halley was born on October 29, 1656, in the parish of St. Leonard's, Shoreditch, and received his education at St. Paul's School, and at Queen's College, Oxford. His first paper (one on astronomy) was read to the Royal Society when he was only nineteen, and during the next sixty years more than eighty papers appeared in the *Philosophical Transactions* under his name. Towards the end of 1676 Halley went to St. Helena, where he spent more than a year making astronomical and meteorological observations, publishing on his return a catalogue of southern stars, which was followed a few years later by the first map of the trade winds. In 1684 he made his famous visit to Newton at Cambridge which led the latter to prepare the "Principia". In 1686, after the first part had been delivered to the Royal Society, Halley not only undertook to supervise the printing, but also made himself responsible for the entire cost. This was because at that time the finances of the Royal Society were so low that it was not only unable to carry out its original resolution to pay for printing the "Principia", but was even unable to pay Halley, then assistant secretary, his promised stipend of £50 a year. In July 1687, in the same month that Halley sent Newton twenty copies of the "Principia" to "bestow on your friends in the University", he accepted seventy copies of Willughby's "De Historia Piscium", published the previous year by the Royal Society, in lieu of some eighteen months salary.

The rest of Halley's career must be passed over quickly. It includes two sea voyages in command of H.M. Pink *Paramour*, the principal object of which was to make observations on the variations of the compass; sixteen years as Savilian professor of geometry at Oxford; and twenty-two years as Astronomer Royal at Greenwich. Seventeen years after his death the comet whose orbit he had calculated returned as he had predicted, thereafter to be known as Halley's Comet.

A friend and correspondent of Halley, William Molyneux (1656–98), was elected a Fellow of the Royal Society in 1685. He was founder and first secretary of the short-lived Dublin Philosophical Society, the forerunner of the Royal Dublin Society founded in 1731. In 1692 Molyneux published "Dioptrica Nova", which contained an appendix by Halley.

Another contemporary scientist interested in optics was the Dutch microscopist Nicolaas Hartsoeker, born on March 26, 1656. He published in 1694 an "Essai de Dioptrique" in which he illustrated his invention, the screw-barrel microscope, generally associated with the name of Wilson, who introduced it to England. Hartsoeker was elected a foreign associate of the French Academy of Sciences, when it was re-constituted in 1699. He died in 1725.

The celebrated French botanist, Joseph Pitton de Tournefort, was also born in 1656, on June 5, at Aix, in Provence. Tournefort studied medicine at Montpellier, and made many botanical journeys, particularly in the Pyrenees, where he suffered great hardships. He was appointed demonstrator at the Jardin des Plantes, Paris, in 1683; and during 1700–2 travelled in Greece and Asia Minor. He died in 1708 as the result of a street accident in Paris. An account of his travels in the Near East appeared in 1717 and was translated into English in the following year. Tournefort's system of plant classification, first described in his "Élémens de Botanique", 1694, was artificial, being based on differences in the corolla, but it was popular and widely used until that of Linnæus was adopted.

The two hundred and fiftieth anniversary of the birth of Benjamin Franklin, American philosopher and statesman, occurs on January 17 (N.S.). The anniversary of the death of John Evelyn, on February 27, 1706, also calls for mention here. Evelyn, best known as a diarist, was closely connected with the early years of the Royal Society, and on two occasions was urged to accept nomination for the presidency, but refused the honour. His book "Sylva" was a valuable account of arboriculture, and his "Fumifugium: or the Inconvenience of the Aer and Smoak of London dissipated" strikes quite a modern note.

It is surely unusual, if not unique, for four generations of a family to succeed one another as directors of a scientific establishment. Jacques Cassini (1677–1756) was the second member of the famous family of French astronomers who for well over a hundred years were in charge of the Paris Observatory. All became Academicians and also Fellows of the Royal Society. Cassini II opposed Newton's theory that the Earth was an oblate spheroid, flattened at the poles, he and his supporters holding that it was flattened at the equator. Two celebrated expeditions, sent by Louis XV to measure a degree of latitude, one in Lapland and the other near the equator in South America, had by 1745 proved that Cassini was wrong and Newton right. Cassini died at Thury, near Clermont, on April 18, 1756.

Not many years after the French expedition had returned from South America, a young Welshman, Lewis Evans, who had emigrated in his youth to North America, was busy carrying out a topographical survey of Pennsylvania. His map of this region, published in 1749, was followed by one that is better known, his "Map of the Middle British Colonies", showing the valley of the Ohio and its tributaries. It was a remarkable achievement, and was re-printed many times—mainly in pirated editions. Evans was a keen observer and recorded many interesting physiographical and geological notes, both on his maps and in his journals[1]. He died on June 11, 1756.

The name of 'lieberkuhn' used to be given to the concave mirror once used on microscopes to illuminate small opaque objects. Its inventor, J. N. Lieberkuhn (1711–56), a German physician and microscopist, not only made excellent microscopes, but was also esteemed for his injected preparations, some of which he is said to have exhibited to the Royal Society, when he was in London about 1740. In particular he studied the structure of the small intestine, describing the Lieberkühn's crypts, as they were later named.

In the field of chemistry, the bicentenary of the birth of J. A. C. Chaptal (1756–1827) is of interest. Chaptal occupied for a time the chair of chemistry founded for him at Montpellier; but he concerned himself especially with applying the new chemical discoveries of his day for the benefit of industry and agriculture. His ability was recognized by Napoleon, who made him Minister of the Interior. During his tenure of office, Chaptal did much to promote applied science. After the fall of Napoleon he was obliged to retire, but in 1816 was nominated a member of the Academy of Louis XVIII.

Although the physician and mineralogist Dr. William Babington (1756–1833) made no outstanding contribution to science or medicine, he deserves remembrance as the senior member of those who founded the Geological Society of London in 1807. In his house this small group of enthusiasts first met, sometimes at seven in the morning, for Babington was a busy physician; and it was he who provided accommodation for the Society's mineralogical collection, until a room at 4 Garden Court, Temple, was obtained in 1809. Babington was president of the Society during 1822–24, and some years later, at the age of seventy-seven, his unabated enthusiasm led him to enrol in a chemistry class held at the new University of London (now University College).

Others born in 1756 include Sir Everard Home, brother-in-law of John Hunter, who gave nineteen Croonian lectures to the Royal Society; Francis Egerton, the eighth Earl of Bridgewater, whose will provided for the famous Bridgewater Treatises; and John Loudon MacAdam, who did so much to improve British highways.

First among those who died in 1856, and whose centenaries will be commemorated this year, is the Italian physicist, Amedeo Avogadro. To-day his name is familiar to every student of chemistry, yet during his lifetime his now famous hypothesis was almost ignored. Avogadro was born in Turin in 1776 and, like Lavoisier, trained as a lawyer, becoming a Doctor of Laws in 1796. But the laws of Nature appealed to him more than the laws of man, and turning to the study of science, in 1806 he began teaching mathematics and physics. The classical paper in which his molecular theory was first expounded was published in the *Journal de Physique* in 1811. This was followed by others, but his views remained unheeded by chemists for forty years or more. Avogadro died in 1856, and it was his countryman Cannizzaro who succeeded, a few years later, in convincing some chemists that Avogadro's hypothesis could be used for bringing order to the complicated matter of atomic weights and the correct formulæ of compounds. Some years were to elapse before acceptance became general, and not until then did Avogadro receive his due meed of recognition as one of the founders of theoretical chemistry. In 1911, a century after the publication of his first memoir, representatives of the scientific world gathered to see the King of Italy unveil a monument to Avogadro in the city of Turin, where all his work had been carried out.

A brilliant young French chemist, C. F. Gerhardt (1816–56), died only a month after Avogadro. With Laurent, he criticized the dualistic theory of Berzelius, and played an important part in the determination of atomic weights and concordant molecular formulæ. Gerhardt taught chemistry in Montpellier and in Paris, but in 1855 was appointed professor of chemistry in Strasbourg, where he died a year later.

Another scientist who, like Avogadro, was too much in advance of his time to receive adequate recognition from his contemporaries was the Russian mathematician Nikolas Lobatchewsky (1793–1856), who wrote the first book on non-Euclidean geometry (the name was given by Gauss). It was published in Russian during 1829–30, and was translated into German in 1840. Lobatchewsky was born in Nijni-Novgorod, but spent most of his life in Kazan, where he was first student, then professor and finally rector of the University. He has been called the Copernicus of geometry; but in his lifetime made little impression and was even, in 1846, inexplicably relieved of his chair and rectorship by the authorities. He died, infirm and sightless, on February 26, 1856.

Two well-known geologists, one English, one Scottish, died in 1856. The senior, the Rev. William Buckland, taught geology in Oxford for more than thirty years, first as reader in mineralogy, then in geology. He did much to render the subject popular, and his lectures and field-classes were always well attended. He was president of the Geological Society in 1824, the year its dining club was founded, and it is entertaining to learn that at the first meeting the Rev. Prof. Buckland bet Mr. Warburton (a former president) two bottles of champagne to one that of several toads enclosed in rock cavities by Mr. (later Sir Charles) Lyell, one would be found alive at the end of a year. As two toads were found alive a year later, the genial Buckland was adjudged to have won his bottle of champagne. Buckland was on excellent terms with Sir Robert Peel, who, while he was Prime Minister, frequently consulted Buckland on scientific matters. Peel nominated Buckland as Dean of Westminster in 1845. A few years later the Dean was overtaken by illness, and he died on August 24, 1856.

Hugh Miller (1802–56), the Scottish geologist, is widely known as the author of that popular and almost classic work, "The Old Red Sandstone". A stone-mason by choice rather than necessity, he worked for some fifteen years among the rocks in which he found so many treasures. His keen observation, coupled with a gift for prose description, resulted not only in remarkable reconstructions of the fossil fishes he collected so patiently, but also in books that were to awaken widespread interest in the methods and results of scientific inquiry. In 1839 he moved to Edinburgh, where he died in tragic circumstances on December 23, 1856. The little thatched cottage at Cromarty where he was born is still maintained as a memorial and museum. In 1938 it was taken over by the National Trust for Scotland, which in 1952 held a meeting there to celebrate the sesquicentenary of Miller's birth[2].

Among the geologists one might also include W. H. Pepys (1775–1856), for he was one of the original founders of the Geological Society. He was, however, better known as a chemist, and in particular as the constructor of some exceptionally large voltaic piles and batteries.

Two amateurs of science call for brief mention here. One is Agostino Bassi (1773–1856), an Italian microscopist who showed that a vegetable micro-organism could be a cause of infection, and thereby ranks as one of the pioneers of the germ theory of disease. The other is the British naturalist William Yarrell, a fine shot and angler, and the author of two works on British birds and British fishes which were for long the standard authorities for naturalists. Yarrell contributed many papers, including the first detailed description of the kiwi, to the *Transactions of the Linnean* and *Zoological Societies*.

Outstanding on the list of those born in 1856 is the name of J. J. Thomson, under whose direction the Cavendish Laboratory at Cambridge became a great centre of research. Thomson enjoyed a tremendous reputation as a leader of research, and not only did he himself gain a Nobel Prize in 1908 for his theoretical and experimental investigations into the transmission of electricity through gases, but no less than nine of those who had worked under him at Cambridge were also awarded Nobel Prizes. In 1918 he became Master of Trinity, and shortly afterwards resigned from the Cavendish professorship. Numerous honours came his way, including knighthood in 1908 and the Order of Merit in 1912; as well as the Royal, Hughes and Copley Medals of the Royal Society. He served as president of the Society during 1915–20. Thomson died on August 30, 1940, in his eighty-fifth year, and was buried in Westminster Abbey.

Among the names of French mathematicians, that of Emile Picard ranks high. Picard, born in Paris on July 24, 1856, was only twenty-four when he published the celebrated memoir on integral functions which made his name and inspired many others to make new discoveries in the field of analysis. His influence was profound, for he was an accomplished teacher as well as an outstanding mathematician. A member of thirty-seven foreign academies, and permanent secretary of the Academy of Sciences in Paris, in 1924 he was accorded the rare distinction of a seat in the literary section of the Institute of France. He died on December 12, 1941.

C. D. T. Runge, born at Bremen on August 30, 1856, was professor of mathematics at Göttingen during 1904–24; as well as attaining eminence as a mathematician, he also achieved distinction in physics, his work on spectral series giving him a place among those whose work formed the experimental basis of quantum mechanics. Runge died at Göttingen in 1927

In the field of botany, an interesting centenary is that of A. F. W. Schimper (1856–1901), who took a foremost place in establishing the science of plant ecology. His book, "Plant Geography", has become a classic. He travelled widely, and was one of the first to prepare a map of plant distribution.

Two biologists who were born in 1856 achieved distinction. Sir Edward Poulton, for forty years Hope professor of zoology at Oxford, was an enthusiastic Darwinist, and made the problem of mimetic resemblances his especial study. He was president of the British Association when it met at Nottingham in 1937. He died six years later at the age of eighty-seven. E. B. Wilson, American biologist, had a great influence on the study of embryology. He studied the growth of the nucleus, and introduced the conception of cell-lineage. A Foreign Member of the Royal Society, he gave the Croonian Lecture in 1913. Another American who should be remembered this year is R. H. Chittenden (1856–1943), who directed the Sheffield Scientific School at Yale during 1898–

1922. He was an early worker in the study of gastrochemical processes, and became world famous as an authority on nutrition.

Other centenaries falling this year include those of J. B. Senderens (1856–1937), the French chemist who was associated with Sabatier in the discovery of the hydrogenation of oils by catalysis; and E. J. Bevan (1856–1921), who jointly with C. F. Cross succeeded in obtaining viscose from cellulose in 1892. Two Americans who made notable discoveries in the field of technology were F. I. Ives (1856–1937), who invented the first successful half-tone process in printing in 1878, and was also an early worker in colour photography; and E. G. Acheson (1856–1931), who patented a successful process for the artificial production of graphite, and developed its use as a lubricant.

In the field of technical chemistry, however, the most important centenary of the year is undoubtedly that of the discovery of the first aniline dye, made by William Henry Perkin in 1856, which is to be marked by celebrations next May. It is proposed to set up a trust fund to finance Perkin Centenary Scholarships, so linking the past and the future, and this seems a particularly satisfactory way of celebrating a centenary.

CENTENARY OF *THE ENGINEER*

By W. J. PRIEST

THIS week, *The Engineer* has celebrated its centenary. A special number of the journal has been published which contains, in addition to a short history, articles by twenty-six eminent authors, which constitute a study of influences on engineering advancement during the past hundred years.

The first number of *The Engineer* appeared on January 4, 1856, and apart from two gaps, caused by the general strike in May 1926 and by the national fuel crisis in February 1947, its weekly publication has been regular and continuous. Although it is not quite the oldest technical journal in Britain, *The Engineer* can claim to be the oldest weekly newspaper serving the interests of engineers in every branch of the profession and industry which it represents. The paper was founded by Edward Charles Healey, a young man of thirty-three, who, it is said, was interested, among many other things, in railway development. The Great Exhibition of 1851 had undoubtedly given an impetus to mechanical invention; there was a place for a journal in which the many engineering developments of the time could be recorded and commented upon. It was that place which *The Engineer* was destined to fill. For seventy-three years the journal continued in the ownership of its founder's family, his son, Sir Charles Chadwyck-Healey, Bart., and a grandson, Sir Gerald Chadwyck-Healey, Bart., in turn succeeding to the chairmanship of *The Engineer* Ltd., while a second grandson, Mr. O. N. Chadwyck-Healey, became managing director. In 1929, *The Engineer* Ltd. amalgamated with Morgan Brothers (Publishers) Ltd. and a new company was formed, retaining the second firm's name, with Sir Gerald Chadwyck-Healey as its first chairman, and Mr. O. N. Chadwyck-Healey as a joint managing director. Now, Mr. O. N. Chadwyck-Healey is the chairman, and Mr. C. A. Chadwyck-Healey, a great-grandson of the founder of *The Engineer*, is the assistant managing director of the owning company.

From the start, the journal promised impartiality in taking "cognisance of all new works relating to the useful arts and allied subjects". In addressing itself to its readers, in the first issue, *The Engineer* declared that "every new moon is witness to the advent of some invention, some happy discovery, or successful application, some change at least, which like more fuel, becomes new incitement to fresh efforts. There is, therefore, no want of scope under the title we have assumed". Certainly, as the years of its first momentous century have rolled by, the scope of the journal has been ever-widening; there can have been few developments in the vast field of engineering progress which have not had some place in its columns.

During its first century *The Engineer* has had five editors, and the service of three of them—the Pendreds—now extends over a period of no less than ninety years. For its first two years, the paper was edited by a Mr. Allen, about whom next to nothing is known apart from the fact that his office was at 32 Bucklersbury, in the City of London, while the publisher's headquarters were at 301 Strand. After Allen's resignation in 1858, an American engineer named Zerah Colburn was appointed by Edward Healey to "an influential position on the staff". Colburn had come to Britain a year earlier in order to study railway development. He was possessed of a photographic memory, wielded a brilliant pen, and in many respects has been accounted a genius. But Colburn's eccentricities were many, and by the end of 1864 his resignation was inevitable.

It was then that Vaughan Pendred, a young Irishman who had lately come to Britain to make his way as an engineer, was invited to take the editorial chair. His letters and articles had attracted the attention of the proprietor of *The Engineer*, and Vaughan Pendred's appointment undoubtedly marked the beginning of a new and greatly improved relationship between owner and editor. Vaughan Pendred missed no opportunity of extending the field and increasing the influence of his paper, and he took early steps to depart from such traditions of technical journalism as then existed. In its early years, *The Engineer* relied mainly on patent specifications for its illustrations; but Vaughan Pendred held that the current engineering practice of the day should be more fully represented, and he persuaded manufacturing and constructional engineers—not without some difficulty, it is said—to permit him to publish drawings of their actual products. For forty years, Vaughan Pendred, who was a master of technical description and criticism, edited the paper, and on his retirement in 1905, he was succeeded by his second son, Loughnan St. Lawrence Pendred, who had become his father's first full-time assistant nine years earlier. L. St. L. Pendred's editorship lasted for forty-one years. He guided *The Engineer* through two World Wars and through the period of depression between those Wars, he ensured that the paper kept pace with the demands of the day, and he rendered innumerable services to the engineering profession generally, among which must be recalled his presidency of the Institution of Mechanical Engineers in 1930. In 1934, L. St. L. Pendred was created C.B.E. in recognition of his work for engineers, and by that time his younger son, Benjamin W. Pendred, had joined the editorial staff. He succeeded his father as editor-in-chief in April 1946—a position which he still occupies.

It is impossible within the compass of this article to make more than a passing reference to the contents of *The Engineer* over its first hundred years. The paper has carefully reported engineering, and many other scientific, developments as they have occurred, but (as was promised in its first issue) it has not confined itself merely to furnishing "a dry register of the progress of machinery". The paper has always covered a broad canvas. There have been articles by many distinguished contributors, such as those, in 1866, by W. J. Macquorn Rankine on "Simple Rules for Practical Calculations of the Efficiency of Steam" and by Prof. John Tyndall on "Ice and Glaciers". In 1867 Samuel Smiles was writing in *The Engineer* about Richard Trevithick's place in the early history of the locomotive, while in 1937, much nearer to the present time, there appeared special articles like those by the late Sir Leonard Hill on "Air Conditioning" and by Sir Harry Ricardo on "Prospects of the High-Speed Heavy Oil Engine". Contributions of this order by distinguished authors have regularly had a place alongside descriptions of all kinds of engineering works, reports of technical meetings and exhibitions, and surveys of economic and labour affairs. At the same time, there has been a place for brief, and interesting, notes such as one, many years ago, setting down the time taken by the winner of "The Derby" as recorded by Benson's chronograph !

The diversity of interest revealed in earlier volumes of *The Engineer* continues unabated. The first hundred years of the journal cover a period in which steam power has reached its zenith and has declined as the utilization of electrical and internal combustion engine power has rapidly advanced. There has been outstanding progress in aeronautics, metallurgy, radio and telecommunications, while the construction of great civil engineering works, the development of mass-production methods, and, not least, the educational and sociological advances in engineering have time and again proved to be of outstanding importance. All of them are matters which have claimed the close attention of *The Engineer*. As the paper moves into its second century, subjects like the fuller development of the gas turbine, nuclear power and automation are prominent. The tempo of technological progress all over the world continues to increase ; but there is no doubt that *The Engineer* will continue effectively to record that progress.

ANTIPROTONS

By Prof. O. CHAMBERLAIN, Prof. E. SEGRÈ, Dr. C. WIEGAND and Dr. T. YPSILANTIS
Dept. of Physics, Radiation Laboratory, University of California, Berkeley, California

Since the development of Dirac's theory of the electron and the brilliant confirmation of one of its most startling predictions by the discovery of the positron by Anderson, it has been assumed most likely that the proton would also have its charge conjugate, the antiproton. The properties that define the antiproton are : (1) charge equal to the electron charge (also in sign) ; (2) mass equal to the proton mass ; (3) stability against spontaneous decay ; (4) ability to become annihilated by interaction with a proton or neutron, probably generating pions and releasing in some manner the energy $2\,mc^2$; (5) generation in pairs with ordinary nucleons ; (6) magnetic moment equal but opposite to that of the proton ; (7) fermion of spin $\frac{1}{2}$. Not all these properties are independent, but all might ultimately be subjected to experiment.

In cosmic rays, where such antiprotons could appear, some events have been observed which could be due to antiprotons ; but their interpretation is uncertain.

In order to generate antiprotons in the laboratory, an absolute lower limit of the necessary energy is $2\,mc^2 = 1{\cdot}88$ BeV. ; but the mechanism of the collision and the conservation of momentum influence this lower limit, which becomes 5·6 BeV. if the process is a nucleon–nucleon collision, or 4·4 BeV. if the process is a two-step one with the formation of a pion in a nucleon–nucleon collision followed by a pion–nucleon collision in which the nucleon–antinucleon pair is generated. These thresholds can be lowered appreciably by internal motions of nucleons in the nucleus. (Energies are quoted in the laboratory system.)

When the Berkeley bevatron was planned, the goal of 6 BeV. was set, in the hope that this energy would be sufficient to create antiprotons.

The methods of detection of the antiproton can make use of any of the seven properties listed above. It seemed that (1), (2) and (3) might be the easiest to ascertain ; (4) would also be highly desirable ; whereas (5)–(7) are at present very difficult to observe.

There are classical methods of measuring charge and mass of a particle that go back in their origin to J. J. Thomson. They entail the simultaneous measurement on the same particle of any two of the quantities momentum, velocity or energy, which in turn can be obtained from the observation of electric or magnetic deflexions, time of flight, range, scattering in photographic emulsions, etc. As for the charge, it is sufficient to measure its sign and its absolute value in a rough way only, because it is assumed that it is an integral multiple of the electronic charge.

After a detailed discussion, it was decided that momentum p and velocity v constituted the most promising combination for ascertaining the mass. The first successful experiment[1] was performed at the end of September 1955, as follows. The momentum was measured by passing the particles generated by bombardment of a copper target with 6·2 BeV. protons through two deflecting magnetic fields and two magnetic lenses. This ensemble let through only particles for which $p = 1{\cdot}19$ BeV./c, if their charge is equal to that of the electron, including sign. The velocity was measured by a time-of-flight measurement between two scintillation counters 40 ft. apart. The pulse-size in the scintillators showed that the particles were singly charged.

The chief difficulty of the experiment rests with the fact that the antiprotons are accompanied by many pions—44,000 pions per antiproton in the most favourable conditions. For this reason provision must be made for eliminating spurious background effects. One of the most important steps is the insertion in the beam of two Čerenkov counters: one that is activated by particles with $v/c = \beta > 0{\cdot}79$, and one of a special type that is activated by particles with $0{\cdot}75 < \beta < 0{\cdot}78$. Pions with $p = 1{\cdot}19$ BeV./c have $\beta = 0{\cdot}99$, while antiprotons of the same value of p have $\beta = 0{\cdot}78$, and their respective times of flight for an interval of 40 ft. are 40×10^{-9} sec. and 51×10^{-9} sec. Particles with β in the interval between 0·75 and 0·78 trigger the sweep of an oscilloscope in which the time of flight between two scintillation counters 40 ft. apart is displayed. This time of flight appears as the distance between the two 'pips' due to the traversal of the counters. From this time of flight the mass is determined with an accuracy of 10 per cent for each particle. Up to now, about 250 particles have been observed and the average mass is known to about 5 per cent. It is 1,840 ± 90 electron masses.

The functioning of the whole apparatus is checked by sending through it positive protons in a separate run. These are obtained from a subsidiary target, and their orbits are selected in such a way that they have the same momentum as the antiproton.

The particles are observable after a time of flight of 10^{-7} sec., which rules out particles with a mean life much shorter than 10^{-8} sec., in particular the known hyperons. These measurements are thus in agreement with points (1), (2) and (3) mentioned above, and the identification of the new particle with the antiproton is a natural one, although not absolutely established.

There are also some indications on the fourth point mentioned above, namely, the terminal process of the particle. Particles selected as antiprotons by the apparatus of ref. 1 were sent into a block of heavy glass and the Čerenkov radiation generated in it was measured[2]. This radiation does not correspond, of course, to the entirety of the energy released; actually it is only a small part of it. However, a calibration was performed, and from the pulse size the visible energy was estimated. Values up to 800 MeV. were found. This is consistent with the expected modes of annihilation for an antiproton, and with the energy it would throw into Čerenkov radiation in a detectable form; but it is not sufficient yet for positive identification on that score only.

Another type of observation on the terminal phenomenon accompanying the absorption of the antiproton was also performed[3] with the photographic plate technique. Particles of selected momentum obtained with an arrangement similar to that described in ref. 1 were slowed down by a copper absorber and finally stopped in a stack of photographic emulsions. Among a background of many pions one particle was found which has protonic mass, comes to rest and produces a star containing six black tracks, one grey proton, one pion of 58 MeV. and one minimum ionization track. The visible energy released is larger than 830 MeV. The total energy released cannot be known, because there are neutral particles emitted; but this amount of visible energy is also consistent with the annihilation of an antiproton.

Clearly many questions are raised by the new particle. Its identification should be further corroborated; it is important to study in detail its annihilation properties for complex nuclei and, possibly even more interesting, the annihilation with hydrogen and deuterium. In addition, the cross-section for nuclear interaction and the mechanism of production are clearly to be investigated.

The existence of the antiproton entails with virtual certainty the existence of the antineutron. Its experimental demonstration is a most interesting problem. Probably the neutron beam of the Berkeley bevatron contains an appreciable number of them, but their disentanglement from the ordinary neutrons appears a formidable task. It is likely that the best approach will be either: (1) to transform an antiproton into an antineutron by a collision with a proton; or (2) to convert an antineutron into an antiproton by collision with an ordinary neutron and detect either the final antineutron in (1) or the final antiproton in (2).

INTERNATIONAL COMPARISONS OF RADIOACTIVITY STANDARDS

During the period May 1952–November 1954, international comparisons have been made of standard samples of the radioactive nuclides sodium-24, phosphorus-32, cobalt-60, strontium-90 + yttrium-90, iodine-131 and gold-198. The organizations taking part in these measurements and comparisons have been the United States National Bureau of Standards, Atomic Energy of Canada, Limited, and four British laboratories (the National Physical Laboratory, the Atomic Energy Research Establishment, Harwell, the Royal Cancer Hospital, London, and the Medical Research Council, London, co-ordinated through the National Physical Laboratory Advisory Committee on Radioactive Standards). Periodical meetings between representatives of the three countries have been arranged by the United States National Research Council Sub-committee on Beta- and Gamma-ray Measurements and Standards. Several papers on the work have already appeared (refs. 1–12).

The samples used for the comparisons were standard solutions prepared by the U.S. National Bureau of Standards, excepting the strontium-90 + yttrium-90 samples, which were prepared by the

Atomic Energy Research Establishment, Harwell. The solutions generally contained a few microcuries per gram. In the case of cobalt-60 and iodine-131, stronger solutions containing of the order of one millicurie per gram were provided. The disintegration-rates of the samples were determined at each of the laboratories by one or more of the following methods: total β-counting in a 4π solid angle, $4\pi\beta\gamma$- and $\beta\gamma$-coincidence counting, and $\gamma\gamma$-coincidence counting. The results of measurements under what are considered to be the best conditions attainable at present are in agreement to within about ± 2 per cent, except for 4π-counting of low-energy β-rays.

In measurements of sodium-24 and gold-198 by $4\pi\beta$-counting, the fractional losses of β-particles by absorption are small and the results agree within ± 2 per cent. They also agree within these limits with $4\pi\beta\gamma$- and $\beta\gamma$-coincidence results. The basic counting measurements for iodine-131 are in agreement within 1 per cent, but there is some uncertainty concerning the allowance to be made for self-absorption. No such allowance was applied by the British and Canadian laboratories; but it has been calculated by the National Bureau of Standards to be about 2 per cent. Owing to the complex disintegration scheme of iodine-131, there is unfortunately no ready means of providing a cross check. The apparent systematic difference of about 3 per cent between the National Bureau of Standards results for iodine-131 and the standard of this nuclide at present adopted in Great Britain and at Chalk River is thus attributable to the correction assumed for self-absorption.

Agreement to within ± 1 per cent was obtained in the measurements of cobalt-60 by $\beta\gamma$- and $\gamma\gamma$-coincidence counting. A wide range of values by $4\pi\beta$-counting was, however, reported by the British laboratories. Subsequent investigations at the National Bureau of Standards showed that, owing to the relatively low energies of the β-particles, the apparent disintegration-rates obtained by $4\pi\beta$-counting were critically dependent on the amount of solid material in the source and on its distribution. Consideration of the cobalt-60 results leads to the conclusion that, owing to the precautions necessary in the preparation of the source, and the uncertainties in the absorption corrections, the $4\pi\beta$-counting method of standardizing this nuclide is at present less reliable than the coincidence method. It is, however, considered that the disintegration-rate of the solution distributed was determined by the coincidence method to an accuracy approaching ± 1 per cent.

Ionization chamber equipment for preserving standards of the nuclides used for these comparisons has been set up at the National Bureau of Standards, and similar equipment is being calibrated at the National Physical Laboratory. The co-operation between the American, Canadian and British laboratories on all matters relating to the establishment and the maintenance of radioactivity standards is to be continued in order to check the agreement already attained, and to extend the comparisons to other nuclides. It is hoped that standardizing laboratories in other countries will participate in future comparisons; those interested should write to the most convenient of the authors of this communication.

TURBULENCE IN THE ATMOSPHERE AND IN THE OCEAN

The study of atmospheric turbulence can reasonably be regarded as having been started some fifty years ago by the distinguished oceanographer, Ekman. Since then, it has progressed in the intermittent way of most branches of science, and at the present it appears to be in a state of flux.

Up to a few years ago, advances in atmospheric turbulence were usually achieved by exploiting the basic similarity between laws of flow on the laboratory and on the atmospheric scale, together with ingenious and painstaking confirmatory observations. These were, for technical reasons, usually made in the lowest 10 m. of the atmosphere, where the horizontal shearing stress can be taken as independent of height, although there were occasional explorations to the top of what was called the 'frictional boundary layer', at about 1 km., beyond which the eddy transfer of momentum was thought to be negligible. The turbulence was often regarded as fluctuations in the wind, temperature and humidity which were too rapid to be recorded by conventional meteorological instruments.

In 1949, however, Priestley made a pioneer statistical study[1] of the horizontal transfer of heat and momentum by motions of large scale, using wind and temperature observations made at daily intervals at all levels over Larkhill. His technique, which was perhaps influenced by the earlier work of Jeffreys and Defant, has since been used by others; it provides a convincing demonstration of the obvious fact that atmospheric turbulence cannot be identified with motions of any particular scale.

The close link between motions on all scales is well shown by the work of Sheppard, Charnock and Francis[2], who from observations made near the Scilly Isles suggested that over the ocean in the Westerlies the shearing stress did not vary with height up to the maximum height observed, about 1 km., and probably beyond. The implication was that the shearing stress was due to turbulent transfer of momentum down a gradient of mean momentum, the gradient being due not only to friction but also to a horizontal gradient of temperature, a thermal wind. The classical concept of a limited friction layer was not valid, at least over the ocean. This work, taken together with that of Priestley and others, fits well with recent models of the general circulation of the atmosphere in which the effects of motion on all scales play a part.

This broadening of the scope of atmospheric turbulence has raised new problems, not only of physics but also of nomenclature; in particular, since turbulence can no longer be regarded as the embroidery on the anemograph, some workers find it convenient to regard the word 'turbulence' as connoting a technique for determining, usually by statistical methods, the properties of any field of flow. This has the great virtue of bringing into the open the difficulties associated with the wide spectrum of atmospheric motions. When used as other than a technique, the word turbulence usually seems to be qualified in some way—by small-scale or large-scale, or by the ubiquitous medium-scale—the word turbulent being used only in such platitudes as "the atmosphere is turbulent on a broad range of scales". The result is that, at a meeting to discuss atmospheric turbulence, the papers may include almost any aspect of dynamical meteorology. This was certainly the case at a symposium held at the summer meeting of the Royal Meteorological Society held at Ashburne Hall, University of Manchester, during July 22–23. Of the four papers presented, one was concerned with motions through the whole atmosphere, two dealt with motions in the lowest 2 km. and one attempted to bridge the gap between small-scale near-surface flow and that at greater heights. A fifth paper, presented in a symposium on oceanographical topics, described eddying motion in tidal flow near the sea bed.

Prof. P. A. Sheppard presented a joint paper on medium-scale turbulence in trade-wind air, which described the results of an expedition to a small island in the West Indies to make observations similar to those made earlier at the Scilly Isles. On fifteen days out of a total of twenty-seven, balloons were released from the upwind shore at intervals of about 10 minutes and were observed every 20 seconds, using two theodolites. The particular interest of such observations in the trades is that the directions of the mean surface wind and the thermal wind are opposed (there was a maximum in the profile of mean wind-speed at a height of a few hundred metres) and that cumulus convection is almost always present. Fluctuations from the mean flow were analysed using averaging periods increasing from 3 hours up to the whole 27-day period. Over this period it was found that horizontal momentum was being transferred to the north by the larger-scale motions which were sampled, a smaller amount being transferred to the south by motions of smaller scale. On no scale was there equipartition of turbulent energy between the three velocity components, the root-mean-square energy in the vertical being one or two orders of magnitude less than that of the horizontal components. A complete account of the results of the expedition is to be published; they will add to our knowledge of the medium-scale turbulence and of the momentum transfer it brings about in this important region.

Mr. F. B. Smith then read his paper on geostrophic and ageostrophic wind analysis[3], in which he estimated the work done over the British Isles by the atmospheric pressure field set up by differential heating. He first reduced the equations of motion to an approximate but observable form which involved the geostrophic and ageostrophic components of the wind-velocity and the radius of curvature of the isobars. These he had obtained by drawing charts using British radio-sonde data at nine levels for every third day of 1953. The rate of production of kinetic energy was found to be of the same order as that found by Brunt by considering dissipation by small-scale turbulence, but it appeared to be differently distributed with height. The flow across the isobars was found to be about the same as would be predicted using the well-known Ekman distribution, again as used by Brunt; some check on this estimate was obtained by calculating the life of typical depressions, which was found to agree with observation. This paper is a good illustration of the close link between motions on the largest and smallest scales.

Turbulence of medium scale is being investigated by Dr. F. Pasquill, who presented a preliminary report of the diffusion of fluorescent dust over distances of some tens of miles and heights of some thousands of feet. The dust particles, of zinc cadmium sulphide, diameter 0·5–3μ, were sampled by the Meteorological Research Flight using an airborne sampler. Individual particles of dust can be counted later, since they fluoresce when irradiated with ultraviolet light. Results so far indicate that the distribution of the dust has the same form at all heights. The height of the cloud was much less than the width: the width did not increase uniformly with distance; the angle subtended at the release point by the cloud at forty miles distance was about half that subtended by the cloud at a mile or so.

Earlier diffusion experiments in Great Britain have been of a smaller scale and usually confined to the lowest 30 m., where the wind direction does not change appreciably with height. The interpretation of these observations of diffusion at greater heights is complicated by the variation of wind with height both in speed and direction.

The variation of wind with height has been studied by many workers since Ekman fifty years ago. It is now well known that in the lowest 10 m. or 100 m. the eddy viscosity increases linearly with height, and Dr. T. H. Ellison described the wind-field to be expected if this linear variation were maintained to greater heights. The solution he has derived has many points of interest and, of course, reduces to the familiar logarithmic distribution of wind with height near the ground. It is possible to allow for the effect of a thermal wind of simple form, and the resulting modification helps in the interpretation of observations such as those described by Prof. Sheppard, particularly over the ocean.

A paper presented by Prof. K. F. Bowden in an oceanographical symposium is also appropriate to this account. He has made measurements, in collaboration with Mr. L. A. Fairbairn, of fluctuations of the three components of current in tidal streams in the Irish Sea using an electrode flowmeter designed at the National Institute of Oceanography. The meter is complicated but seems quite suitable for recording fluctuations in current; the velocity of the mean current is not recorded. Prof. Bowden gave a good deal of information about the correlations of the fluctuating currents, and it was clear that much valuable work remains to be published.

NEWS and VIEWS

New Year Honours List

The following names of scientists and others associated with scientific work appear in the New Year Honours List:

Baronet: Sir Hubert Houldsworth, chairman of the National Coal Board.

K.C.B.: Sir Frederick Brundrett, chairman of the Defence Research Policy Committee and scientific adviser to the Minister of Defence.

K.B.E.: Alexander Glen, secretary, Department of Agriculture for Scotland.

D.B.E.: Prof. Kathleen Lonsdale, professor of chemistry and head of the Department of Crystallography, University College, London.

Knights: Dr. Eric Ashby, president and vice-chancellor of The Queen's University, Belfast; Dr. Ralph G. Hawtrey, president during 1946–48 of the Royal Economic Society, for services to the study of economics; Dr. Joseph Burtt Hutchinson, director of the Empire Cotton Growing Corporation's Cotton Research Station, Namulonge, Uganda; Dr. Eric J. F. James, high master, Manchester Grammar School; Walter Mercer, professor of orthopædic surgery, University of Edinburgh, president of the Royal College of Surgeons, Edinburgh; Prof. Alfred G. Pugsley, professor of civil engineering, University of Bristol; Prof. Samuel McM. Wadham, professor of agriculture, University of Melbourne, for public services; Prof. Solly Zuckerman, Sands Cox professor of anatomy, University of Birmingham, deputy chairman of the Advisory Council on Scientific Policy.

C.B.: Dr. W. Cawood, principal director of scientific research (air), Ministry of Supply; W. C. M. Couch, deputy director of electrical engineering, Admiralty; H. Hardman, deputy secretary, Ministry of Agriculture, Fisheries and Food; W. J. Richards, director of the Radar Research Establishment, Ministry of Supply.

C.M.G.: J. A. Beckett, assistant secretary, Ministry of Fuel and Power; F. S. Collier, forestry adviser to the Secretary of State for the Colonies; Prof. S. H. Roberts, vice-chancellor of the University of Sydney; Dr. J. A. Venn, president of Queens' College, Cambridge, lately chairman of the Colonial Studies Committee.

C.B.E.: Prof. C. E. H. Bawn, Grant-Brunner professor of inorganic and physical chemistry, University of Liverpool; W. H. Cashmore, director of the National Institute of Agricultural Engineering, Silsoe, Bedfordshire; S. H. Clarke, director of the Fire Research Station, Department of Scientific and Industrial Research; H. V. Disney, chief engineer, Industrial Group Headquarters, Risley, United Kingdom Atomic Energy Authority; Dr. A. T. Doodson, director of the Liverpool Observatory and Tidal Institute; Prof. W. P. Evans, professor of chemistry, Canterbury University College; R. Graham, director of aircraft research and development, Ministry of Supply; H. V. Hayes, director of air technical publications, Ministry of Supply; W. E. Hiley, director, Woodlands Research Department, Dartington Woodlands, Ltd.; C. E. Hudson, senior education and advisory officer, National Agricultural Advisory Service, Ministry of Agriculture, Fisheries and Food; H. D. Lewis, assistant secretary, Ministry of Agriculture, Fisheries and Food; Prof. J. R. Matthews, lately chairman of the Scottish Committee of the Nature Conservancy, and chairman of the council, Macaulay Institute for Soil Research; T. N. Mitchell, president of the Royal Agricultural Society, State of Victoria; Dr. A. S. Parkes, director of the Division of Experimental Biology, National Institute for Medical Research; Dr. H. Richardson, principal of the Bradford Technical College; H. D. Skinner, director of the Otago Museum and lecturer in anthropology in Otago University; H. C. Smith, secretary of agriculture, State of Tasmania; Dr. Kenneth M. Smith, director of the Virus Research Unit (Agricultural Research Council), Molteno Institute, University of Cambridge; R. S. Stafford, technical director, Handley Page, Ltd.; W. G. Rodway, for anti-locust work in East Africa; S. G. Wilson, director of veterinary services, Northern Region, Nigeria.

Archæology in the University of London: Prof. V. Gordon Childe

Prof. V. Gordon Childe is retiring from the chair of prehistoric European archæology in the University of London and the directorship of the Institute of Archæology in Regent's Park. We may hope that he will have a very happy period of retirement and that his increased leisure will enable him to give us the results of his mature conclusions. Childe is an Australian and was at Oxford when the First World War started; at the time his health was not good, but after the War he spent a long time in Central and Eastern Europe. It was here that his great knowledge of, and interest in, the early story of mankind in these areas developed. For a short time he acted as librarian at the Royal Anthropological Institute, but shortly after this the new Abercromby professorship of archæology at Edinburgh was founded and Gordon Childe was its first holder. Most of the students there only took archæology as a subsidiary subject, though there were a few honours candidates. Prof. Childe was very popular with his students and laid the foundation of what has become an important archæological school. He also did a considerable amount of archæological investigation in Scotland, and his work at Skara Brae is well known. Later Childe was offered and accepted a chair in the University of London, which carried with it the directorship of the Archæological Institute of the University. Here again with his colleagues he built up an important school, and one can only regret that his retirement occurs before the Institute moves into more official quarters in the new University building itself. It is to be hoped that, as is the case at Cambridge, the University of London may yet see its way to recognize archæology as an honours school for degree-giving purposes. It is well known that Childe holds strong ideological views not acceptable to everyone, but that must not be allowed to obscure the enormous amount of solid factual archæological work and teaching that he has accomplished; he is one of the leading prehistorians to-day.

Mr. W. F. Grimes, C.B.E.

The University of London Institute of Archæology, founded with a voluntary staff and director in 1937, has been directed since 1946 by the professor of prehistoric European archæology in the University, Prof. V. Gordon Childe; but since it has been receiving financial support from the University of London the Institute has extended so rapidly, and in particular the teaching work in prehistoric European archæology has increased so much, that on the resignation of Prof. Childe the Senate has decided to separate the posts, and has invited Mr. W. F. Grimes to accept the directorship. Prof. Gordon Childe's resignation from his double post takes effect on September 30, 1956.

Mr. Grimes, a graduate of the University of Wales, began his professional archæological career as assistant in the National Museum of Wales. While there he conducted many important excavations on prehistoric and Roman sites, undertook comprehensive field surveys of prehistoric monuments, and wrote a "Guide to the Collections illustrating the Prehistory of Wales". This was published in 1939, but republished in 1951 as "The Prehistory of Wales"; for it was, in fact, far more than a guide, but presented Welsh prehistory in its British and European setting. At the end of 1938 Mr. Grimes was appointed assistant to the Archæological Officer in the Ordnance Survey; but on the outbreak of war he was seconded to the Ministry of Works to conduct rescue excavations on archæological sites threatened by the construction of aerodromes or military works. These excavations resulted in many important discoveries, of which only a small part has yet been published, a full publication by H.M. Stationery Office being in preparation. At the end of the War, Mr. Grimes was appointed director of the London Museum when Mr. (now Sir Mortimer) Wheeler was appointed director-general of archæology in India. It thus fell to Mr. Grimes to find a new home for the Museum that was ejected from Lancaster House, and to install the collections in their new premises in Kensington Palace. At the same time Mr. Grimes had to organize and direct the excavations of the bombed sites in the City of London that have brought to light so many new details as to the topography and architecture of the Roman and medieval city, including the Temple of Mithras. Mr. Grimes is now president of the Council for British Archæology.

The Engineer

This week sees the centenary of *The Engineer* (see p. 10 of this issue), and a special issue has been prepared to mark the occasion. It is a remarkable and absorbing compilation, with its 124 pages of editorial matter and its 300 or so pages of advertisements. The Editor has assembled a notable collection of articles from leading authorities on the development and present situation in the main fields of engineering. These have been grouped into six sections, concluding with a fine series of coloured plates of modern manufacturing plant and products. The articles range from one by Sir Albert Pugsley on "Scientific Discovery" to others by Sir Christopher Hinton on "Nuclear Power", Dr. H. A. Thomas on "Electronics" and Dr. D. F. Galloway on "Production Methods"; between them these two give a good condensed picture of the present and future influence of automatic control in industry. Attention is also paid to engineering materials with articles on "Iron and Steel", "Non-ferrous Metals", "Concrete" and "Plastics". The publishers are to be congratulated on producing a volume, worthy of their high reputation, which will be of permanent value and interest.

Institute of Metals: Medal Awards

The Institute of Metals has awarded the following medals: *Institute of Metals Medal in Platinum* (1956), to Prof. G. L. Chaudron (professor at the Sorbonne and director of the Vitry Laboratory of the Centre National de la Recherche Scientifique), in recognition of his outstanding contributions to knowledge, particularly in the field of the light metals, which have greatly benefited the metal industries; *Rosenhain Medal* (1956), to Dr. D. McLean (principal scientific officer, Metallurgy Division, National Physical Laboratory, Teddington), in recognition of his outstanding contributions to knowledge in the field of physical metallurgy; *W. H. A. Robertson Medal* (1955) and premium of fifty guineas, to E. J. Thackwell (Northern Aluminium Co., Ltd., Rogerstone, Mon.), for a paper on the choice and construction of monolithic linings for twin-bath induction furnaces for melting aluminium alloys.

Staffing the United Kingdom Atomic Energy Authority

An adjournment debate on the staff of the Atomic Energy Authority, opened by Mr. A. Neave, was held in the House of Commons on December 21, and in replying for the Government the Minister of Works, Mr. N. Birch, said that, since the annual report of the Authority was issued, further measures have been taken to improve the pay and conditions; these should give the Authority greater flexibility and enable it to compete successfully with outside industry. As regards the transfer of staff from the Civil Service, 78·5 per cent of the Civil servants now with the Authority have accepted the offers; 10·5 per cent have rejected them and 11 per cent have not yet notified the Authority of their wishes. Only 8 per cent of the professional and scientific staff have decided not to avail themselves of the offer, whereas 15 per cent of the executive and clerical staff have rejected them. Many of these latter are of considerable seniority, but the numbers are not large and most of the wastage has been made good without much difficulty. As regards training, there are comprehensive schemes for craft and student apprenticeships, and practical training is sometimes provided for students before they enter the university or after graduation. Very special consideration has been given to 'sandwich' courses, and the Authority also runs a large number of advanced courses in nuclear technology within its own organization. Sympathetic consideration has been given to the difficulties experienced in getting technical training by staff at such places as Dounreay and Calder Hall, but Mr. Birch was unable to say anything more in reply to Mr. Neave's suggestion for a large central institution for nuclear physics or nuclear technology. The Minister thought that any real danger of widespread redundancy is remote whatever the future of nuclear weapons; the Authority would be only too glad to utilize any skilled personnel released from the weapons group. Mr. Birch could say nothing definite about the future pattern of the Authority. It is a pioneering organization, he said, which must keep abreast of advances in scientific thought and of new knowledge. Both scientific and administrative skill are needed, and the Authority will continue to require to recruit good men for its expanding field. Mr. H. Usborne suggested that the Authority is recruiting an excessive proportion of young engineers.

International Control of Nuclear Weapons

Replying to questions in the House of Commons on December 19, the Minister of State for Foreign Affairs, Mr. A. Nutting, said that no specific action has yet been taken on the proposal he made in the United Nations Disarmament Sub-Committee on October 7 for a conference of scientists representing each member country of the Sub-Committee to report on the possibilities of controlling nuclear weapons. A variant of this proposal was contained in a resolution passed by the United Nations Assembly the previous week, but was opposed by the U.S.S.R. Nevertheless, said Mr. Nutting, the Government is still seeking to get agreement to some scheme of this kind and has not abandoned hope of a disarmament agreement on conventional weapons, although it also hopes ultimately to achieve a comprehensive agreement embracing nuclear weapons when means of control have been discovered.

Journal of Analytical Psychology

Although the followers of Freud have been well supplied with literature, the disciples of Jung have not been so fortunate. It is therefore gratifying to find that the Society of Analytical Psychology, London, has decided to produce its own journal, called the *Journal of Analytical Psychology* (1, No. 1 (1955); published by the Tavistock Publications, Ltd., 2 Beaumont Street, W.1; 12*s*. 6*d*. per issue or 21*s*. per vol. of two issues). In this first issue it is stated that "the decision to launch a Journal of the Society did not spring only from the publicly expressed observation that we produce no journal, but also, indeed one could say mainly, from the internal vitality of its members, now over forty in number". In the past the writings of the Jungian school have tended towards theorization rather than a clinical approach, and it is a good thing that most of the papers here are concerned with patients rather than myths. Nevertheless, since mythology and anthropology play such a large part in the Jungian approach, a great deal of space is devoted to the relationship of dreams to primitive thought. The most important paper in this issue is that of J. Layard, on boar-sacrifice, in which the dream of a patient about cooking ham and being chased by a pig is related to the ritual sacrifice of pigs in Malekula. Another long paper is by Robert F. Hobson, on archetypal themes in depression, and Robert Moody writes on the function of counter transference. L. Stein writes on loathsome women and Amy Allenby on the father archetype in feminine psychology. Anthony Storr contributes a note on cybernetics and analytical psychology. There is also a long critical notice on the collected works of C. G. Jung and on Jung's "Answer to Job". It is difficult for anyone who has not been educated in the Jungian discipline to evaluate these papers. Those used to analysing dreams by free association, using the patient's interpretation, are likely to feel that they might have been interpreted otherwise, but in any event such clinical work is always of interest. It is to be hoped that this journal prospers, if only for the fact that it allows one to see how others are thinking.

University of Sheffield

The following have been appointed to lectureships in the University of Sheffield: Miss S. K. R. Clarke (bacteriology and virus diseases) and R. G. Siddall (fuel technology and chemical engineering). The present chair of fuel technology and chemical engineering in the University is to be called the Newton Drew chair in memory of the late Mr. and Mrs. W. Newton Drew. Mr. Newton Drew served on the University Council (1924–34), and was also treasurer of the University (1926–32) and a pro-chancellor (1932–34); Mrs. Newton Drew served on committees of the University for many years, and both were generous donors to the University. The present occupant of the chair is Prof. M. W. Thring.

Announcements

The Charles Mayer Prize of the Société de Chimie Biologique has been awarded for 1955 to Prof. S. Ochoa (University of Chicago) and Mme. M. Grunberg-Manago (of the Centre National de la Recherche Scientifique, France). The Prize, which is worth 500,000 francs, has only recently been created and is to be awarded annually, provisionally until 1960, for distinguished work on nucleoproteins.

Mr. G. F. Adams, scientific adviser to A. Gallenkamp and Co., Ltd., and Mr. H. B. Toft, formerly principal of Bath Technical College and recently a sales executive of the Company, have been elected to the board of directors of A. Gallenkamp and Co., Ltd.

The Royal Agricultural Society of England is offering its annual Research Medal, together with an award of a hundred guineas, for work of outstanding merit carried out in the United Kingdom which has proved, or is likely to prove, of benefit to agriculture. Recommendations for the award can only be made by the head of the university department or research organization concerned. Such recommendations, with nine copies of the candidate's relevant papers, should be sent before January 31 to the Secretary of the Society at 16 Bedford Square, London, W.C.1.

The Education Panel of the Corrosion Group of the Society of Chemical Industry has established a prize of 25 guineas, to be awarded annually, for an essay or paper on any aspect (not necessarily research) of the corrosion of metals and its prevention. Competitors must not be more than twenty-seven years old, and their contributions, which may contain diagrams and photographs, should be about three thousand words in length. Entries must be submitted before March 31 to the Corrosion Group Essay Competition, c/o Society of Chemical Industry, 56 Victoria Street, London, S.W.1.

SCIENCE AND DEFENCE IN GREAT BRITAIN

THE statement made by the Prime Minister, Sir Anthony Eden, in the House of Commons on October 25, on the administrative responsibilities of the Minister of Defence made no specific reference to the position of the Defence Research Policy Committee. Sir Anthony stated that arrangements have been made to co-ordinate, under the Minister of Defence, planning and training for the joint action of civil and military forces in home defence. The Minister of Supply has become a fourth Defence Department within the co-ordinating powers of the Ministry of Defence, and the Minister is now responsible for seeing that the composition and balance of forces within individual Armed Services meet the strategic policy laid down by the Defence Committee. A new post of chairman of the Chiefs of Staff Committee, to which Sir William Dickson has been appointed, has been created, and this officer will normally be the United Kingdom representative on the Military Committee of the North Atlantic Treaty Organization and on other international defence organizations.

These arrangements were discussed in a debate on the Armed Services in the House of Lords on November 8 and 9, in which the importance of research and of the scientist in defence was repeatedly stressed. In reply to Lord Swinton, who had urged that the Minister of Defence should also be responsible for deciding what research programmes should be undertaken and their priority, the Lord President of the Council, Lord Salisbury, said that the Minister of Defence has already been given responsibility for framing general policy governing research and development. Lord Rea suggested that the immensely accelerating rate of scientific discovery imposes on the Government a great responsibility to assess the future in terms which no individual past training and no previous experience can fulfil. Lord Hore-Belisha, too, was concerned as to the extent to which the scientist exerts an effective influence on policy, and Lord Freyberg also urged that a forecast of the effect of scientific invention upon the conduct of future wars should precede any reorganization or amalgamation of the Services. No one outside those responsible for the conduct of research knows either the aim of scientific invention or what has already been accomplished. Lord Balfour, in particular, emphasized the need for scientifically trained personnel in the Services, and doubts were freely expressed as to the extent to which amalgamation is possible and the level at which integration is desirable.

The Parliamentary Secretary to the Ministry of Defence, Lord Carrington, replying to the debate, assured the House that the Government attaches the greatest importance to scientists playing a sufficient part in the central organization for defence. The chairman of the Defence Research Policy Committee attends meetings of the Chiefs of Staff Committee whenever he wishes, and Lord Carrington doubted whether a week passes without him discussing some matters personally with the Chiefs of Staff. Although he is not a member of the Defence Committee, his views are invariably known to, and expressed by, the Minister of Defence, and the Defence Committee on occasion invites him to attend. The Chiefs of Staff have also asked the Scientific Adviser to the Minister of Defence to be the chairman of sub-committees to consider long-term problems. Lord Carrington emphasized that there is always a strong representation of scientists at the major exercises held by the Service Departments and the North Atlantic Treaty Organization; scientists are encouraged to put forward their ideas, and they are warmly welcomed by members of all three Armed Services.

THE BRITISH FLORA DURING 1955

STUDY of the British flora during 1955 has led to no outstanding additions to the list; but collectively the results represent important progress. This includes interesting extensions of the known range of some of the less-common species, a clearer understanding of the taxonomic value of various units, and the recognition of new ones. These, and other aspects, were illustrated by the exhibits at the annual exhibition meeting of the Botanical Society of the British Isles, arranged in the lecture room of the British Museum (Natural History) on November 28.

The meeting was attended by some three hundred members and guests, and a full account of the exhibits will appear in the *Proceedings* of the Society.

During the year many field botanists have been concentrating on work in connexion with the Distribution Maps Scheme[1] organized by the Society. The direct results of this were shown in an exhibit prepared by the Cambridge headquarters of the Scheme, which included a map showing the 10-km. squares of the National Grid for which lists of more than 50, 150 and 250 species, respectively, have been received. Although considerable gaps still remain, the progress of the work, which is still only in its second year, is well up to expectations. Mr. F. Perring and Dr. S. M. Walters (Cambridge) also showed examples of distribution-patterns revealed in the course of local surveys for the Scheme around Newton Stewart (Galloway) and Llanrhaiadr (Denbigh and Montgomery).

A by-product of the Scheme was the discovery of *Orchis militaris* in Suffolk, where a colony of more than five hundred plants was found by a worker listing the species of a 10-km. grid-square. This very rare plant, of which photographs were shown, is new to East Anglia. As in the only other known British colony (in Buckinghamshire), a large number of flower heads were found eaten off; but some seed capsules mature. An equally important, and perhaps more surprising, extension of range was the discovery of *Trientalis europaea* in a boggy alder-birch coppice, also in Suffolk. This was shown by Dr. F. Rose (Bedford College, London), with a map of the distribution of the species in Britain showing that the new locality is some hundred and fifty miles south of the nearest previously known station for this northern plant.

The flora of Rockall, which is about three hundred miles off the north-west coast of Scotland, was the subject of an exhibit by Miss Y. Chamberlain (British Museum (Natural History)). As a result of collections made from near the base of the rock by Charcot in 1921, and from the upper parts by James Fisher on September 18 last, twenty-one plant species are now known. These include one lichen (*Verrucaria* sp.), the remainder being algae. No flowering plants are to be found on this sea-swept and isolated rock.

Miss M. E. Bradshaw (Durham College) showed large-scale distribution maps of some *Alchemilla* microspecies in Teesdale and other valleys. These were plotted on a grid of 0·2 km. and showed interesting correlation with roadsides and fields used by grazing animals. A. C. Jermy (University College, Leicester) illustrated the distribution of *Luronium natans*. This was recorded from Ellesmere, in Shropshire, early in the nineteenth century and spread from Blake's Mere to the Shropshire Union Canal. It is still spreading in the Manchester, Stafford and Montgomery areas along the canals. Other localities are lakes, some of which are isolated in mountain districts, and it is suggested that water-birds as well as water-carriage may be agents in its dispersal. Another aquatic was shown by Miss E. J. Gibbons and J. E. Lousley, who exhibited *Alisma gramineum*. This is already known from a lake in Worcestershire where it grows in shallow water with flowers, fruits and leaves usually above the surface. In September, Miss Gibbons discovered the species near Spalding in Lincolnshire, and subsequent investigation showed that it occurs in four rivers and drains. The plant there is completely submerged—even the fruits being well below the surface of the water—and very different superficially from the Worcestershire form. The occurrence of the species in Lincolnshire fits in well with the known Continental distribution and establishes it as an undoubted native in Britain.

Dr. C. D. Pigott (Sheffield) illustrated the distribution of the native race of *Polemonium coeruleum* on black humus-rich soils on ledges of limestone cliffs or screes in the Pennines and Cheviots. Transplant experiments suggest that the moisture content of the soil is critical. Its presence in widespread localities during late-glacial times has been confirmed repeatedly, and it is now known to have persisted through the post-glacial. Dr. E. M. Evans (Nature Conservancy) provided an exhibit on the distribution and ecology of *Primula farinosa*. It is found in short turf grassland of dry soils, in *parvocaricetum* of flushed soils, and in fen, and its tolerance of this wide range of habitats can be explained by the theory that a high water-table is required for maximum development. An interesting study of the changes which have taken place in the flora of a small area in the course of a century was provided by O. Polunin (Charterhouse). He compared the 702 species recorded by J. D. Salmon for the Godalming district in 1849 with the 1,016 species known in 1955. During this period there has been a great decline in arable land and big increase in built-up areas, roads and paths. Alien plants form a larger proportion of the present flora, and a few species have become extinct during the period. Comparisons of this kind can make a valuable contribution to our knowledge of the changes which are taking place in the British flora generally.

Several exhibitors showed plants which are likely to prove of importance as additions to the list of British species. One of the most interesting of these is a *Sparganium*, noticed in substantial numbers this autumn along two to three miles of the banks of the Thames near Oxford; this was exhibited by M. D. Gwynne (Oxford). It has large fruits, of which a big proportion are two-seeded, and was at first thought to be a polyploid form of *Sparganium ramosum* ($2n=30$); but it has been found to have about the same chromosome number. Of species already described, it seems to be near the North American *S. eurycarpum* Engelm., but further study is required before it can be named. W. M. Baron and R. Kemp (Oxford) showed the grass *Nardurus maritimus* from recent collections in Berkshire, Oxfordshire and Hampshire and gave some of the previous records with maps showing the British and Continental distribution. From the time it was first noticed in Lincolnshire in 1903[2], its status has been in dispute; but our increased knowledge of the species suggests that in calcareous grassland it may well be native. The inland *Armeria* exhibited by Miss E. J. Gibbons and J. E. Lousley was first recorded from near Grantham in 1726[3], and there are many eighteenth-, nineteenth- and twentieth-century notices over a wide area of the old 'Lincoln Heath' in Lincolnshire and Leicestershire. In spite of the existence of supporting specimens, some botanists have regarded the inland occurrence of the usually maritime thrift as so improbable that the records have been dismissed as errors or introductions. In fact, there seems no real reason to doubt that the plants are native, and it was suggested that specimens gathered at Ancaster this year (and probably those at the other places) are *A. elongata* (Hoffm.) Koch, which occurs inland on sandy heaths over much of northern central Europe. The taxonomic rank of this plant is uncertain, and for the time being it should perhaps be treated as a variety of the 'Atlantic' *A. maritima*, which is a common coastal plant. An exhibit provided by the Department of Botany of the British Museum (Natural History) included specimens of plants of which accounts had appeared in *Watsonia* or the *Proceedings* of the Society during the past year.

One of the most interesting exhibits showing the important contribution which breeding experiments can make to taxonomic research was provided by M. Cole (Southampton). *Chenopodium album* and *C. reticulatum* are easily distinguished by the markings on their seed-coats, and they have been treated as separate species; but Mr. Cole has shown that the seed-coat markings on any particular plant are determined by the male pollen parent (xenia) and are therefore not a reliable guide to taxonomic status. J. P. Savidge (Liverpool) exhibited *Callitriche platycarpa* as a distinct species in Britain. His observations confirm recent work in the Netherlands[4] that this is quite distinct from *C. stagnalis* in both chromosome and morphological characters. He has noticed at least nine ecological forms, varying mainly in the form of the leaves, and the majority of old records and herbarium sheets of *C. palustris* (*C. verna*) and *C. polymorpha* in Britain can be referred to this species. J. A. Ratter (Liverpool) demonstrated morphological criteria in the *Dryopteris spinulosa* complex. He showed that epidermal and spore characters readily separate *D. spinulosa* and *D. dilatata*. N. M. Pritchard (Oxford) exhibited forms of *Gentianella campestris* in connexion with biometric analysis and cultural experiments being undertaken to ascertain if *G. baltica* is distinct from *G. campestris*, and if so, whether *G. campestris* forms a uniform group. Dr. E. F. Warburg (Oxford) showed forms of *Sedum forsterianum* and its allies which he has under cultivation, while B. N. Bowden (also of Oxford) illustrated the differences in the stomata between *Sesleria coerulea* and the British *S. varia* with a map showing doubtful as well as the accepted records of the latter in Britain. J. G. Packer (University College, Leicester) had a critical review of the criteria used for distinguishing the genus *Sieglingia*, in which he concluded that the relationship between *Danthonia calycina* and *Sieglingia decumbens* is one of species and not of genus. J. Rossiter (Oxford) showed specimens of *Ranunculus acris* and *R. bulbosus* which he had had in cultivation from Teesdale and Durham, and suggested that they included two ecotypes in each case. P. M. Benoit showed two forms of *Spartina townsendii* that he had found on mudflats near Barmouth Junction station, one of which had anthers only 5–7 mm. long, incompletely exserted, or exserted on short filaments, with small imperfect pollen grains and the styles small. This more slender plant is perhaps male-sterile, and was compared with a stouter form with anthers 8–11 mm. long exserted on long filaments with the pollen fully formed. P. D. Sell (Cambridge) and Dr. C. West exhibited a series of critical *Hieracia* and suggested that a long list of names in current use are synonyms of a single species.

It has already been shown that two species have been confused as greater bindweed—the native *Calystegia sepium* and the introduced *C. sylvestris*[5], which is more common in many districts. To these, an exhibit by Dr. S. M. Walters (Cambridge) and Prof. D. A. Webb (Trinity College, Dublin) added a third, the pink-flowered *C. dahuricus* Herbert apud Sims, which can be distinguished by the narrow leaf-shape and hairy winged petioles, and is widespread. G. Halliday (Cambridge) showed how another alien, *Arenaria balearica*, has been recorded from numerous widespread localities in Britain. As long ago as 1861 observations of this plant in Scotland aroused heated argument[6], and in 1908 it was remarked that it was "gradually making its way into our flora"[7]. To describe *Hieracium spraguei* as an 'endemic alien' would appear to be a contradiction in words, but, so far as our knowledge goes, this is a true statement of the position. Pugsley in 1948[8] described the species as new to science based on a plant found by Dr. T. A. Sprague in Buckinghamshire near Chorley Wood in 1923 and 1925. Despite careful search by several botanists, it could not be refound until R. F. Turney, who showed it at the exhibition, sent to Kew specimens collected by Mrs. A. T. Peppercorn in 1951. They have now found it in five localities in Buckinghamshire and one in Hertfordshire, but although the species is undoubtedly an alien in Britain, its native country is still unknown.

Mrs. B. H. S. Russell exhibited herbarium specimens and a drawing of *Dichondra repens*, a plant widespread both in the tropics and some temperate countries, which she had found established on dunes near Hayle, Cornwall. Miss C. M. Goodman showed a most interesting series of alien grasses found in fields in Worcestershire where their seeds had been introduced in wool 'shoddy'.

From the library of the Department of Botany of the British Museum (Natural History) was an exhibit of original drawings for Sowerby's "English Botany" for comparison with the copper-plate engravings of the first edition and lithographs of the third. From the same library came manuscripts of Wolley-Dod's "Flora of Sussex", Rea's "Botany of Worcestershire" (with the published works for comparison), Benbow's "Floras of Uxbridge and District and of Middlesex", and Trimen's annotated copy of Brewer's "Flora of Surrey". Mrs. H. N. Clokie (Oxford) showed specimens and manuscripts throwing new light on Dillenius and John Sibthorp. It seems that the types for Dillenius's new species in the third edition of Ray's "Synopsis" are likely to be found among Sherard's specimens rather than in the Dillenian Herbarium, most of the material of which was evidently collected after publication of the "Synopsis"[9].

Other exhibits included coloured photographs of some British plants by K. Le Sueur, an interesting photograph of *Ophrys fuciflora* believed to have been found in the Cotswolds, with an account of the circumstances by C. Thomas, records from the Lleyn Peninsula by Dr. A. P. Conolly, the stolon system of *Glaux maritima* by F. N. Hepper and Euphrasias in southern England by P. F. Yeo.

INTERNATIONAL ANALOGY COMPUTATION MEETING

THE Société Belge des Ingénieurs des Télécommunications et d'Électronique organized last year a series of lectures and colloquia on the various aspects of analogy computation. These meetings, held on a local basis, aroused so much interest and seemed to lead to such fruitful discussions that the Society decided, in collaboration with the Société Belge des Électriciens and the Société Belge des Mécaniciens, to organize a larger international conference on this subject. This meeting was arranged for the period September 26–October 2 in Brussels, and was attended by four hundred scientists and engineers from seventeen countries. Apart from many Belgian participants, strong delegations went from the United States, France and Great Britain, and among the foreign guests were several scientists from the U.S.S.R. and from Poland. In conjunction with the scientific sessions, an exhibition of analogue computing equipment and of many interesting and novel applications was held.

The great number of papers submitted for reading (one hundred and one) made it necessary to conduct two parallel sessions, and several additional discussion meetings in smaller circles took place. To preserve the unity of the conference, the following invited survey papers were given before the whole audience on succeeding days, before splitting up for the specialist parallel sessions: "Les analyseurs différentiels électroniques", by M. F. H. Raymond; "Electrical network analysers", by Mr. E. L. Harder; "La méthode d'analogie rhéoélectrique, ses possibilités et ses tendances", by Prof. L. Malavard; "The mechanical differential analyser, recent developments and applications", by Mr. J. G. L. Michel; "Resistance-network analogues", by Dr. G. Liebmann; "Pédagogie concrète du calcul fonctionnel linéaire", by Prof. J. Brodin; and "Special computers", by Prof. H. Wallman. About 50 per cent of all contributions dealt with various aspects of electronic analogue computers, including differential analysers, simulators, etc., about 30 per cent with electrical analogues, such as electrolytic tanks and resistance-networks and their recent applications, and the remaining 20 per cent with mechanical differential analysers and various special-purpose computers. The review papers and the original communications, together with the discussions on these papers, will be published in full as Proceedings of the International Analogy Computation Meeting, Brussels, 1955, and its editors hope that the volume will be available at an early date.

It was decided during the meeting to form an International Association for Analogy Computation (Association Internationale pour le Calcul Analogique), and the chairmen of the various sessions, representing a good international cross-section, were asked to act as members of the organizing committee. The purpose of the new International Association for Analogy Computation is the furthering of this field by the organization of national and international scientific meetings, and the publication of a multi-language bulletin or periodical devoted to the scientific and engineering basis of analogue computers and to their steadily growing applications. Collaboration will be sought with existing organizations in the fields of electrical and mechanical engineering, and with those working with other computing techniques. The basic organization of the new Association will be in the hands of its first elected president, Prof. J. Hoffmann, and his colleagues at the Université Libre, Brussels.

This first international analogy computation meeting, bringing together people from many countries, was considered by all participants a very stimulating event, and the excellent organization of the meeting by the Société Belge des Ingénieurs des Télécommunications et d'Électronique and the great hospitality enjoyed will be remembered by all.

G. Liebmann

CHEMISTRY AND PHYSIOLOGY OF PHOSPHOLIPIDS

SYMPOSIUM IN ONTARIO

During October 12–13, some hundred and twenty scientific workers gathered at the University of Western Ontario, London, Ontario, to attend a symposium on phospholipids sponsored by the Biochemistry Division of the Chemical Institute of Canada. The success of the meetings, planned by Prof. R. J. Rossiter and members of the local committee of the Institute, was attested by the enthusiastic response of all participants. The papers and succeeding discussions will be published in full in the *Canadian Journal of Biochemistry and Physiology*.

The first part of the symposium, with Dr. A. M. Wynne (University of Toronto) in the chair, was entitled "Chemistry of Phospholipids" and dealt with current advances in knowledge of the structure and properties of the phospholipids. Dr. Erich Baer (Toronto) outlined the elegant synthetic methods used by his group for preparing optically pure α- or β-isomers of glycerophosphoric acid, glycerylphosphorylcholine, phosphatidic acids, lecithins, glycerylphosphorylethanolamine, glycerylphosphorylserine, and phosphatidyl serine. He also described the 22-step preparation of the first synthetic lipopeptide, L-α-(distearoyl)-phosphatidyl-L-serylglycylglycine. Finally, he reported on the first synthetic preparation of a fully unsaturated lecithin, L-α-dioleyllecithin. Of particular interest is the ability of this substance to render a number of polar compounds soluble in organic solvents, and its property of high stability to atmospheric oxidation. Dr. Baer emphasized the consistency with which the L-configuration and α-structure appear in natural glycerolphosphatides. In discussing Dr. Baer's paper, Dr. C. S. McArthur (University of Saskatchewan) commented on the attempts to prepare lecithins from L-α-glycerylphosphorylcholine by other methods. He also pointed out the possibilities of appreciable phospholipid losses during the dehydration of tissue with acetone prior to lipid extraction.

Drs. J. Folch and F. N. LeBaron (Harvard Medical School) critically reviewed the current state of knowledge of the chemistry of phosphoinositides. It was pointed out that the common feature of this class of lipids is the presence of meso-inositol, phosphoric acid and fatty acids. In some cases carbohydrates or amines are present and often glycerol. The five phosphoinositide preparations discussed include soybean lipositol, brain diphosphoinositide (the only member of the group from which inositol diphosphate has been obtained rather than the usual monophosphoric acid ester), peanut glyceroinositophosphatide, and wheat germ and cardiac muscle glyceroinositophosphatidic acids. Dr. Folch reported on the hydrolysis studies which have been carried out, the difficulties of obtaining uncontaminated preparations, and the appearance of inositol in other lipid complexes, and he emphasized the need for further structural studies. Dr. C. C. Lucas (Toronto) pointed out that the ubiquitous occurrence of inositol in biological material suggests a role as an essential component, and this is strengthened further by the observed lipotropic action of inositol.

The recent progress in the chemistry of sphingolipids was comprehensively reviewed by Dr. H. E. Carter (University of Illinois). He outlined the classical evidence for relative positions of functional groups on sphingosine and described his synthesis of tribenzoyl-D-*erythro*-dihydrosphingosine, which has properties conforming to those of the tribenzoyl derivative of the naturally occurring material. The application of infra-red techniques to establish the *trans*-structure of the double bond was mentioned, and the structure of sphingosine has finally been proved to be D *erythro*-1, 3-dihydroxy-2-amino-4-*trans*-octadecene. This would appear to be confirmed by the recent reports of the synthesis of sphingosine. Dr. Carter pointed out the difficulties encountered in establishing the *erythro*-configuration of sphingosine as it occurs in cerebrosides due to possibilities of inversion during hydrolysis. However, he showed that the analogous compound, phrenosine, contains sphingosine bearing the *erythro*-configuration, and he gave further information regarding cerebrosides and cerebroside sulphuric ester, although the configuration of the galactosidic bond remains unsolved. The steps which have led to the elucidation of the structure

RP307

of sphingomyelin were then described, and mention was made of the complex glycosides of sphingosine, including gangliosides, hæmatosides, globosides, strandin, and polycerebrosides. Most of these glycolipids contain hexosamine or neuraminic acid. Finally, Dr. Carter reported the finding of phytosphingosine in corn phosphatides and preliminary evidence favouring the view that corn phosphatides contain phytosphingosine as phytosphingolipids rather than as simple phytocerebrosides.

Dr. J. F. Berry (Western Ontario) re-emphasized the importance of the techniques presented by Dr. Carter for approaching the characterization of sphingolipids and the nature of the complex bonds in proteolipids and lipopeptides. He described preliminary studies on the successful paper-chromatographic separation of intact tissue phospholipids, and stressed the importance of these techniques in identifying and purifying new phospholipids.

The second part of the symposium, with Dr. W. R. Bloor (University of Rochester, New York State) in the chair, was devoted to "Metabolism and Function of Phospholipids". Dr. E. P. Kennedy (University of Chicago) introduced his account of the biological synthesis of phospholipids by emphasizing the contribution made by the advent of isotope tracer techniques and their application to studies in cell-free enzyme preparations. He reviewed the evidence pointing to L-α-glycerophosphate as a precursor to phospholipids, a point demonstrated by the incorporation into phospholipids of glycerophosphate labelled with phosphorus-32. Dr. Kennedy's group provided the next logical step by the isolation and partial purification of a rat liver enzyme, glycerokinase, which synthesizes L-α-glycerophosphate from adenosine triphosphate and glycerol. Dr. Baer's suggestion that natural glycerophosphatides are of the L-α-configuration was given support by this finding and by the observation that only the L-α-glycerophosphate can be incorporated into phospholipids. Kornberg's earlier work was reviewed, which demonstrated the activation of fatty acids to acyl-coenzyme A derivatives with adenosine triphosphate, and the attachment of these acyl-coenzyme A esters to L-α-glycerophosphate to form phosphatidic acid, the function of which was the subject of much discussion during the remainder of the symposium. Kornberg had earlier suggested that phosphorylcholine could be incorporated into lecithin by condensation with phosphatidic acid, inasmuch as the incorporation of a phosphorylcholine unit into lecithin was demonstrated. Dr. Kennedy's group has found that large amounts of adenosine triphosphate are necessary to accomplish this reaction in mitochondria. Further scrutiny reveals that the active co-factor is a cytidine triphosphate contaminant of the adenosine triphosphate preparation. Dr. Kennedy and his co-workers have demonstrated a condensation between cytidine triphosphate and the phosphorylcholine unit with the formation of cytidine-diphosphorylcholine, which was isolated chromatographically, estimated in tissues by isotope dilution techniques, and chemically synthesized. Labelled synthetic cytidine-diphosphorylcholine, as well as cytidine-diphosphorylethanolamine, have been shown to act as precursors for the isotope in phosphatidyl choline and phosphatidyl ethanolamine, respectively. Furthermore, tissue enzymes have been found that are able to synthesize the cytidine diphosphate bases. This reaction is reversible and is also completely specific for cytidine triphosphate and represents the first co-enzymatic rôle found for this nucleotide. Enzymes have previously been described that are able to phosphorylate choline or ethanolamine from adenosine triphosphate. Dr. Kennedy pointed out the bearing such metabolic pathways might have upon the biosynthesis of other phospholipids and on the lipotropic effect of choline.

Dr. G. C. Butler (Toronto), in discussing Dr. Kennedy's paper, raised the pressing point of the nature of the acceptor for phosphorylcholine. Phosphatidic acid, triglycerides and diglycerides are prominent among the suspected compounds. However, attempts to demonstrate any of these compounds as intermediates have met with failure.

Dr. L. E. Hokin (McGill University) presented the results of his studies on the metabolism of phospholipids *in vitro*, in which he has found that cholinergic drugs and pancreozymin in the pancreas, and acetylcholine and adrenalin in the salivary glands, all stimulate the secretion of protein. In each case, the high secretion of protein is accompanied by an increased incorporation of phosphorus-32 into the phospholipids. These studies were carried out with actively respiring tissue slices. The observed effects were only slight in homogenate preparations, and were not accompanied by changes in respiration or labelling of acid-soluble phosphorus compounds. Dr. Hokin has extended these studies to include guinea pig brain-cortex slices, where a similar stimulation of the incorporation of phosphorus-32 into phospholipids was obtained with acetylcholine. This was abolished in the presence of atropine. In both pancreas and brain slices, incubated with phosphorus-32 and glycerol labelled with carbon-14, acetylcholine stimulated primarily the incorporation of phosphorus-32 with little effect on the incorporation of carbon-14. This was taken to indicate an increased turnover of a phosphorus-containing portion rather than increased total synthesis of phospholipid. By mild alkaline hydrolysis of the lipid extracts and paper-chromatographic separation of the products according to the technique of Dawson, Dr. Hokin has demonstrated that acetylcholine maximally stimulates the incorporation of phosphorus-32 into phosphatidic acid and phosphoinositide in brain and pancreas. Appreciable effects were noted on phosphatidylcholine in brain and on phosphatidylethanolamine in pancreas.

Dr. R. J. Rossiter (Western Ontario) pointed out two additional physiological conditions, namely, starvation and cold stress, which produce changes in lipid labelling from one substrate and not from another. In these cases, phospholipid labelling from acetate-1-^{14}C is decreased, with no change in labelling from glycerol-1-^{14}C, glycine-2-^{14}C, or inorganic phosphorus-32. In addition, Dr. Rossiter gave details showing a greater incorporation of glycerol-1-^{14}C into the glycerol portion of phosphoglycerides than into the glycerol portion of phosphatidic acid. This supplies further evidence tending to negate the suggestion that phosphatidic acid might function as an acceptor of phosphorylated base.

Dr. J. M. R. Beveridge (Queen's University, Kingston, Ontario) reviewed the current views on the function of phospholipids and, among other functions, discussed their role as a structural element. Although there is little to support the notion that phospholipids act as intermediates in the resynthesis of triglycerides during fat absorption, it is considered that they are involved in this process in some manner.

Dr. Beveridge gave evidence contrary to the belief that phospholipids comprise a vehicle for the transportation of fatty acids, although he pointed out that the phospholipids as β-lipoproteins may play a part in the transport of neutral fat. Finally, he quoted from the literature in support of the theory that choline-containing phospholipids facilitate the oxidation of fatty acids. He emphasized that no single function of the phospholipids could be stated in a positive manner. Dr. O. F. Denstedt (McGill University) commented on the physico-chemical function of phospholipids at biological interfaces.

JAMES F. BERRY

MELTING OF SOLIDS

SYMPOSIUM IN OTTAWA

A SYMPOSIUM on melting, diffusion and related topics was held during October 24–25 at the National Research Council Laboratories, Sussex Drive, Ottawa, under the chairmanship of Dr. D. K. C. MacDonald. The meeting was held at the invitation of the Low Temperature and Solid State Physics Group of the Division of Pure Physics, National Research Council of Canada, for the purpose of bringing together scientists within easy reach of Ottawa interested in melting from the different points of view of chemist, geophysicist, metallurgist and physicist. Twelve lectures were given; fifty minutes was allotted to each, of which about twenty was reserved for questions and discussion. It was found that this schedule allowed each speaker time for an adequate exposition of his subject, while preserving the balance of lecture and discussion.

A contrast soon became apparent between the working concepts of the physicists and chemists and those of the metallurgists. The physicists and chemists tended to regard both solid and liquid as homogeneous down to atomic dimensions, and thought in terms of thermodynamics and statistical mechanics. Thus, in his introductory lecture, Dr. MacDonald discussed self-diffusion and melting, using the model of 'hole' formation in the crystal lattice, and outlined the evidence which suggests that melting occurs when the hole concentration has risen to the order of 10^{-3}. J. S. Dugdale (National Research Council) gave a comprehensive review of both experimental and theoretical work on the behaviour of the melting curve at high pressures. Two papers from Chalk River described investigations of structure and diffusion in liquids using slow-neutron diffraction: D. G. Henshaw and D. G. Hurst have determined radial distribution functions in liquid helium, which show marked increase in short-range order with increase of pressure; and B. N. Brockhouse has made some preliminary measurements of the energy distribution in neutrons scattered from liquids, data which, after suitable analysis, can give information about self-diffusion and time-dependent pair distribution functions in the liquid. J. A. Morrison (National Research Council) described experiments on surface melting in adsorbed layers of argon and nitrogen on substrates of titanium oxide, with an anomaly in specific heat becoming rapidly sharper as the thickness of the layer increased. The interpretation of these results was discussed by D. C. Patterson (University of Montreal), using an order–disorder model for melting, and later by the meeting at large.

W. B. Pearson (National Research Council) described experiments on dilute alloys illustrating the effects of lattice distortion upon melting temperatures. The other metallurgists were concerned to make plain the inhomogeneous nature of the melting process, making use of photographs of the melting and freezing interfaces in metals. A. Rosenberg (University of Toronto) showed that freezing in 'pure' lead takes place by lamellar growth, and that melting appears to be the same process in reverse; this was effectively illustrated in a film using suitable space and time magnification. J. W. Rutter (University of Toronto) described the freezing of impure metals and showed how the formation of impurity substructures depends upon the concentration of impurity, rate of freezing, and temperature gradient in the liquid. E H. McLaren (National Research Council) has used precision (10^{-4} deg. C.) resistance thermometry for investigating the freezing and melting temperatures of zinc and tin, and has found that differences of freezing technique and thermal history can cause changes up to about 10^{-2} deg. C. In a brief, provocative talk, W. C. Winegard (University of Toronto) emphasized the difference of outlook of physicist and metallurgist and criticized the theories of the former for taking no account of the impurities and dislocations which are known to play an important part in melting. A lively discussion followed, profitable because the participants had already listened to uninterrupted expositions of each other's work.

Any doubts of the usefulness of even the crudest of fundamental theories was dispelled by R. J. Uffen (University of Western Ontario), who described how knowledge of the physics of condensed phases is used in attempts to deduce the composition and state of the Earth's mantle and core. For this purpose not nearly enough is yet known about the physics of high pressures, and bold extrapolations from laboratory pressures have to be made. The success of the symposium makes it probable that similar meetings will be arranged for the discussion of other subjects related to work in low-temperature and solid-state physics.

T. H. K. BARRON

CHEMICAL COMPOSITION OF PARTHIAN COINS

AN outstanding example of the value of accurate and complete chemical analyses in the investigation of ancient metals, when these are afterwards interpreted by an ingenious mind, is given in a monograph on the "Chemical Composition of Parthian Coins", by Earle R Caley, published by the American Numismatic Society, New York (Numismatic Notes and Monographs, No. 129; 1955). The author has made a large number of analyses of Parthian silver and bronze coins not only for the major constituents but also for minor impurities. There is internal evidence that these are reliable, and much new light is thrown on a field of historical metallurgy concerning which knowledge has hitherto been most meagre.

An elegant piece of detective research has revealed, practically beyond doubt, the materials from which the debased silver coins of the King Orodes I (57–38/37 B.C.) were made. From analyses of silver coins of the highest fineness for the time, it is shown that the 'pure' silver available might contain just over 99 per cent of silver and gold together (the presence of traces of gold in the silver was not recognized by early metallurgists) and perhaps 0·4 per cent of lead. Accepting this composition for the basis metal, the other impurities—tin, part or all of the lead, iron, nickel and, in one case, zinc—will, in the main, have come in with the copper when this and the silver were melted together. It is possible, therefore, to calculate the composition of the copper alloy used.

From such calculations it is clear that two different materials have been employed at different times, for the drachm and for the tetradrachm, and presumably at different mints. In one case the alloy appears to have been prepared from the 'pure' silver and very impure, but virgin, copper, the average analysis of that used in the manufacture of the drachms being: copper, 95; tin, 1·7; lead, 2·8; iron, 0·1; and nickel, 0·1. The copper used for the tetradrachms was of much better quality, being approximately: copper, 99; tin, 0·3; lead, 0·5; iron, 0·1; and nickel, 0·1; which in all probability was of the highest purity then available to the mint. The marked difference in these two analyses would suggest that the drachms and the tetradrachms were struck at different mints, which were possibly a considerable distance apart.

In the other case, there is consistent evidence that a bronze was employed the composition of which was very approximately: copper, 91; tin, 5·5; lead, 3; iron, 0·1; and nickel, 0·1. Comparison of this result with analyses of the earlier Parthian bronze coins shows that the two compositions are in many cases not greatly different either in the major elements present or in the content of impurities. It is suggested, therefore, that the bronze used for preparing the debased alloys was obtained by melting down bronze coins of the earlier Parthian kings. In some cases the amount of lead present is in excess of that likely to be present in the silver and that introduced by the bronze, and it may be, therefore, that in such coins a relatively small amount of lead was deliberately added as such.

F. C. Thompson

NATIONAL RESEARCH COUNCIL OF CANADA

REPORT FOR 1954–55

THE thirty-eighth annual report* of the National Research Council of Canada covers the year ended March 1955, and comprises, besides the president's report, the financial statement and the balance sheet and annual statement of Canadian Patents and Developments, Ltd. The president's report notes that in 1954 the National Research Council provided 2·5 million dollars in 410 awards and 263 scholarships for fundamental research at the universities, and that since the end of the Second World War the Council's support to the universities has increased five-fold. The Council's own scientific staff numbered 548, with 711 technicians and 775 engaged in general service and administrative, as well as about a hundred postdoctorate Fellows. Technical inquiries from Canadian industries numbered about seven thousand five hundred, and the president stresses the value of the work of the twenty-eight associate committees in dealing with scientific and technical problems of national scope.

In an effort to reduce the surface drying of foodstuffs, the Division of Applied Biology has obtained relative humidities approaching saturation by cooling an experimental room indirectly through a jacket of cold air, and recent studies by the Division have shown that the grey discoloration of processed pork occurs much more rapidly in the muscle pigment, myoglobin, than in the blood pigment, hæmoglobin. Investigations of the frozen storage of living cells and small organisms have shown that glycerol reduces freezing damage by changing the pattern of ice-formation. Studies of the carbohydrate composition of various grains, woods and marine algæ have shown that in most plant tissues large quantities of hemicellulose and other complex sugars are associated with cellulose.

The scientific interests of the Maritime Regional Laboratory have been broadened considerably, and a dryer capable of operating on half-ton batches has been designed and constructed for studies of the drying of seaweeds and similar material. Nutritional tests on dried dulse and rockweed meals indicated that the meals compared favourably with casein and were superior to gelatin or soybean in regeneration of liver protein. A method has been developed for determining the presence of carrageenin in seaweeds, and a study of the cause of the flakiness of cod fillets was commenced. At the Prairie Regional Laboratory, Saskatoon, work was continued on the utilization of agricultural materials, including the utilization of straw for pulp, and an investigation on the production of lysine by fermentation. A new fermentation has been developed for *d*-arabitol, glycerol and erythritol. A study of contributory factors in elevator dust explosions points to particle size as the most important factor, only those fractions which pass through a 150-mesh screen being potentially dangerous in initiating explosions.

In the Division of Applied Chemistry, special attention was given to the corrosion in automotive cooling systems by ethylene glycol and the corrosion of iron in aqueous solutions, while studies of the adsorption and desorption of detergents by textiles, using radioactive tracer techniques, have led to a better understanding of detergent action and indicated possibilities for obtaining higher efficiencies in laundering. Work on the direct oxidation of ethylene to ethylene oxide has led to basic studies on the phase behaviour and magnetic susceptibilities of oxidation catalysts, the kinetics of the photochemical oxidation of hydrocarbons, the catalytic polymerization of ethylene and physical adsorption at gas–solid interfaces. Promising results were obtained in a new drying technique for contacting solids and fluids.

The Division of Pure Chemistry continued its investigations of alkaloids and also work on the quantitative description of solvolytic reactions of aromatic and aliphatic sulphonic acids in water and alcohols. Studies of infra-red spectra have been applied to the identification of small amounts of steroid hormones and metabolites isolated from natural sources, and work on free radicals has been extended to the liquid and solid states. A method has been developed in the Molecular Spectroscopy Section for obtaining standard Raman intensities, the sum of which is useful in determining the structure of petroleum hydrocarbons; and in a study of the extent to which the properties of very small solid particles differ from those of bulk solids, besides effects due to the small dimensions, effects attributable to the structure of solid surfaces have been found.

---

* Thirty-eighth Annual Report of the National Research Council of Canada, 1954–55, including the Annual Report of the Canadian Patents and Development, Ltd. Pp. 44. (N.R.C. No. 3607.) (Ottawa: National Research Council, 1955.)

In the Division of Physics, the Applied Physics Branch has provided a common dosage standard for X-radiation at cancer clinics throughout Canada, has made a significant contribution to Canadian mapping methods, and has completed a mutual inductance on which the Canadian ohm will be based, a highly precise temperature scale extending over most of the international scale, and the reproduction of the standard of brightness through the brightness of melting platinum. A major effort in the Interferometry Section was the study of new wave-length standards with the view of basing the international metre, and hence the Canadian yard, on a wave-length. Good progress was made on an analytical method of bridging, and the usefulness of a radar altimeter and of combined vertical and oblique aerial photographs was also demonstrated. The Pure Physics Branch reports a considerable advance in the knowledge of the relative ionizing effects of particles of different energies, in the energy-range of billions of electron volts, and the same photographic plate technique has been used to study and identify rare types of mesons produced by cosmic rays. The outstanding developments in the Solid State Physics Group have been in studying 'anomalous' electron behaviour in metals at low temperatures, and the resistance minimum in copper was studied in greater detail in an attempt to understand its origin. Well-resolved absorption and emission spectra of the molecules O_2, NO, NO^+, HCN, CO and CN in the vacuum ultra-violet have been obtained with the 3-m. vacuum spectrograph, and using the same instrument the absolute wave-length of the Lyman alpha-line of deuterium has been determined with considerable precision. The structures of pyrobelonite and brackebuschite (vanadium minerals), codeine hydrobromide dihydrate, lindgrenite (a copper molybdate mineral) and potassium dithionate have been determined in the X-Ray Diffraction Laboratory.

The Division of Building Research continued to develop steadily, and, in co-operation with the Central Mortgage and Housing Corporation, steady progress was made in the improvement of technical housing standards and designs, consistent with every practicable reduction in true costs. A completely revised National Building Code of Canada was issued in June 1954, and the research into fire fatalities is already yielding significant results. Jointly with the Meteorological Division of the Department of Transport, the Division also published the first Climatological Atlas of Canada, the result of two years work by its own climatologist.

Much of the work of the Division of Mechanical Engineering continued to be devoted to defence, but in the Hydraulics Laboratory activity was concentrated on projects related to the St. Lawrence Seaway development. Extended work was carried out on the suitability of Western Canadian fuel oils for industrial gas turbines, and the facilities of the Fuels and Lubricants Laboratory were being extended to permit qualification tests of heavy-duty automotive and marine oils, hypoid gear lubricants, lubricating greases, and hydraulic and brake fluids. The investigation of aircraft icing in flight was terminated, but the icing project is continuing with an investigation of the icing of helicopters, while icing protection studies have also been made on radar components; gas turbine components, radomes and icing instruments.

About half the work of the Radio and Electrical Engineering Division has continued to be concerned with defence; but besides the microwave position-fixing system for inshore survey operations, the Division has designed a microwave system to operate combined automatic-light and fog-alarm stations which cannot be easily or economically controlled by submarine cable, and two installations have been completed. Considerable progress has been made in developing an instrument making an electronic inspection for flaws of high-quality paper while it is being manufactured. The use of silica in place of germanium as the active element in transistors was being investigated, and theoretical studies of electron-tube physics have led to the development of a new detector for microwave energy and to a new laboratory method of measuring the maximum electron emission from cathodes. An experimental microwave radio link has been established between Ottawa and Toronto to study the scattering of microwave signals beyond the horizon, caused by turbulence in the atmosphere, and, besides daily observations of radio emission from the Sun on a wave-length of 10·7 cm., three electronic musical instruments were being developed.

The Division of Medical Research made 151 grants during the year and granted eight senior and sixteen ordinary research fellowships. About two-thirds of the grants were for a continuation of researches.

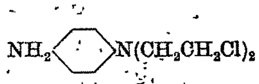
SELECTIVITY OF ENZYME-ACTIVATED NITROGEN MUSTARDS

By P. HEBBORN and PROF. J. F. DANIELLI

Zoology Department, King's College, London, W.C.2

IN chemotherapy, in general one of the outstanding problems is to obtain drugs which will have a much greater effect upon the cells which are intended to be the target for the drug than upon other cells. In the chemotherapy of tumours, this problem is particularly difficult to solve because tumour cells closely resemble many normal cells, to which extensive damage cannot be tolerated. In theory, the selectivity of a drug can be increased by administering it as a derivative, the action of which is contingent upon one or more cellular variables[1]. The more variables involved in eliciting the action of a drug, the greater will be its selectivity.

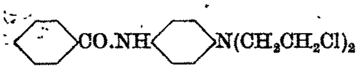
We have made a preliminary investigation of this theory, starting from the aromatic nitrogen mustards, such as (I), which have been developed at the Chester



(I)

(II)

(III)



(IV)

(V)

Beatty Research Institute. The action of this compound, and a number of its derivatives, has been examined by intramuscular injection into Wistar albino rats bearing the Walker rat sarcoma 256. The derivatives were compounds (II), (III) and (IV). The cytotoxic action of nitrogen mustards is believed to be caused by ionization of a chlorine atom from a β-chloroethyl group to give a highly reactive carbonium ion, $R.CH_2CH_2^+$. It has been shown, particularly by the work of Haddow, Kon and Ross[2] and Ross[3], that in the derivatives of phenyl di-(β-chloroethyl) amine the rate of formation of carbonium ions is modified by substitution in the benzene ring. The general conclusion has been that derivatives with a high rate of formation of carbonium ions have a pronounced inhibitory effect on tumour growth, whereas derivatives with a low rate of ionization have no effect. Compound (I) has a very high rate of ionization, whereas in (II), (III) and (IV) the rate of ionization is greatly reduced. Thus the general toxicity, and action upon tumours, of (II), (III) and (IV) should be much less than with (I), except in the case of cells which contain enzymes capable of liberating (I) from the derivatives: that is, the action of (II), (III) and (IV) should be restricted to those cells which contain enzymes capable of liberating (I) by hydrolysis of the CONH group. Thus in theory these compounds are provided with the equivalent of a selective proximity fuse.

To study this theory, we have investigated (*a*) the toxicity of the compounds to rats not bearing tumours, (*b*) the cause of death with the different compounds, (*c*) the action upon the Walker rat sarcoma 256, and (*d*) the enzyme content of the tumour and certain organs of the rat.

The results are summarized in Table 1. The rate of hydrolysis, in the second column, determined by Dr. W. C. J. Ross, gives a measure of the rate of formation of carbonium ions. The third column contains *LD*50 values, as a measure of toxicity. The detoxication caused by acylation is very striking. The trichloracetyl derivative had less than one two-hundredth of the toxicity of the parent compound. The decreases in toxicity are much greater than can be accounted for by the changes of rate of hydrolysis.

Table 1

Drug	Rate of hydrolysis per cent (Ross)	*LD*50 (mgm./100 gm. rat)	Action on tumour	Enzyme units/gm. tissue	
				Liver	Tumour
(I)	> 100	0·6	(+)		
(II)	42	4·8	++	1·8	0·29
(III)	13	> 100	++	40	0·36
(IV)	40	35	−	0·35	0·05

Despite the large variations in toxicity, the cause of death was probably the same for all four compounds. Before death the abnormalities were a progressive loss of weight (up to 30 per cent), diarrhœa which was occasionally hæmorrhagic, an erythematous condition of the nose, muzzle and eye regions, a general weakness of the rat associated with apathy, laboured breathing, coldness and, finally, coma.

Post-mortem observations indicated that the gut was affected to the greatest extent. Macroscopically, this was marked by a loss in tone and distension due to fluid and gaseous contents. The spleen and body-fat were reduced.

Cytological examination showed that there was an absence of mitosis in the gut and a drastic reduction in the size of the villi in rats subjected to drugs (I) and (II), whereas the gut of rats subjected to drug (IV) showed no histopathological symptoms.

The action of a cytotoxic agent upon a tumour may be to cause regression, to inhibit further growth, to slow the rate of growth, or negligible. The action of compounds (I)–(IV) was tested upon tumours which had grown to a volume of 5–10 ml. Each compound was given in a daily dosage of one-third to one-tenth of the *LD*50, for up to eight days. With the parent compound (I), the rate of growth of the tumour was reduced and there was a considerable fall in body-weight. With (II) and (III) regression occurred, and there was a fall in body-weight. Compound (IV) had no action upon either the tumour or body-weight. There is no correlation between either toxicity, or rate of hydrolysis, and action upon the tumour.

When tested for enzyme able to hydrolyse the amide linkage in compounds (II)–(IV), the different organs of the rat differed markedly. For example, with the acetylamino-group, muscle had little activity, whereas kidney, liver and intestine had marked activity. The tumour activity was marked towards the acetylamino- and trichloroacetylamino-groups, and negligible towards the benzoylamino-group. There is a correlation between ability to cause regression and presence of a significant amount of activating enzyme in the tumour.

The results obtained support the view that the selectivity of a cytotoxic compound can be increased by converting it to a derivative from which the parent compound can be released by enzyme activity. With the three derivatives used here, in two cases the selectivity for tumour cells was notably increased, and in the other case equally decreased: these differences were correlated with presence (or absence) of activating enzyme. A similar correlation has been obtained with the corresponding derivatives of the phenolic mustard (V). It is interesting that such considerable differences exist between derivatives obtained with such simple acylating agents: with more complex inactivating agents a higher degree of selectivity may be expected.

The nitrogen mustards act most strikingly upon cells in which growth and division are rapid. The selectivity of the derivatives studied here is based on at least two cellular variables—growth-rate and enzyme content. It seems probable that a further increase in selectivity could be introduced by using inactivating agents introducing dependence upon yet a third variable. For example, acylation of (I) with an amino-acid might be expected to add dependence upon active transport of amino-acids. Investigations of this nature are now being made, with assistance provided by the British Empire Cancer Campaign.

We are indebted to Boots Pure Drug Co., Ltd., for the gift of compounds (I), (II) and (III), to Dr. W. C. J. Ross, who synthesized compound (IV) for us, to Mr. J. A. Marsh for help and advice with the tumour tests, and to Prof. A. Haddow and Dr. L. N. Owen for advice on many points. One of us (P. H.) has held a studentship of the Medical Research Council while carrying out this work. [Oct. 10

CORRELATION BETWEEN PHOTONS IN TWO COHERENT BEAMS OF LIGHT

By R. HANBURY BROWN

University of Manchester, Jodrell Bank Experimental Station

AND

R. Q. TWISS

Services Electronics Research Laboratory, Baldock

IN an earlier paper[1], we have described a new type of interferometer which has been used to measure the angular diameter of radio stars[2]. In this instrument the signals from two aerials A_1 and A_2 (Fig. 1*a*) are detected independently and the correlation between the low-frequency outputs of the detectors is recorded. The relative phases of the two radio signals are therefore lost, and only the correlation in their intensity fluctuations is measured; so that the principle differs radically from that of the familiar Michelson interferometer where the signals are combined before detection and where their relative phase must be preserved.

This new system was developed for use with very long base-lines, and experimentally it has proved to be largely free of the effects of ionospheric scintillation[2]. These advantages led us to suggest[1] that the principle might be applied to the measurement of the angular diameter of visual stars. Thus one could replace the two aerials by two mirrors M_1, M_2 (Fig. 1*b*) and the radio-frequency detectors by photo-electric cells C_1, C_2, and measure, as a function of the separation of the mirrors, the correlation between the fluctuations in the currents from the cells when illuminated by a star.

It is, of course, essential to the operation of such a system that the time of arrival of photons at the two photocathodes should be correlated when the light beams incident upon the two mirrors are coherent. However, so far as we know, this fundamental effect has never been directly observed with light, and indeed its very existence has been questioned. Furthermore, it was by no means certain that the correlation would be fully preserved in the process of photo-electric emission. For these reasons a laboratory experiment was carried out as described below.

The apparatus is shown in outline in Fig. 2. A light source was formed by a small rectangular aperture, 0·13 mm. × 0·15 mm. in cross-section, on which the image of a high-pressure mercury arc was focused. The 4358 A. line was isolated by a system of filters, and the beam was divided by the half-silvered mirror M to illuminate the cathodes of the photomultipliers C_1, C_2. The two cathodes were at a distance of 2·65 m. from the source and their areas were limited by identical rectangular apertures O_1, O_2, 9·0 mm. × 8·5 mm. in cross-section. (It can be shown that for this type of instrument the two cathodes need not be located at precisely equal distances from the source. In the present case their distances were adjusted to be roughly equal to an accuracy of about 1 cm.) In order that the degree of coherence of the two light beams might be varied at will, the photomultiplier C_1 was mounted on a horizontal slide which could be traversed normal to the incident light. The two cathode apertures, as viewed from the source, could thus be superimposed

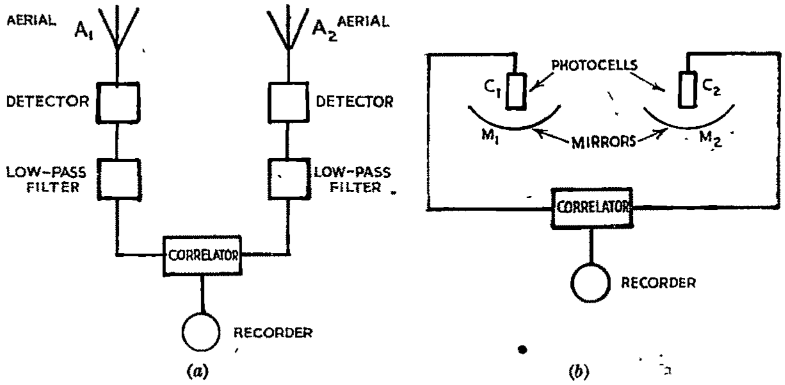

Fig. 1. A new type of radio interferometer (*a*), together with its analogue (*b*) at optical wave-lengths

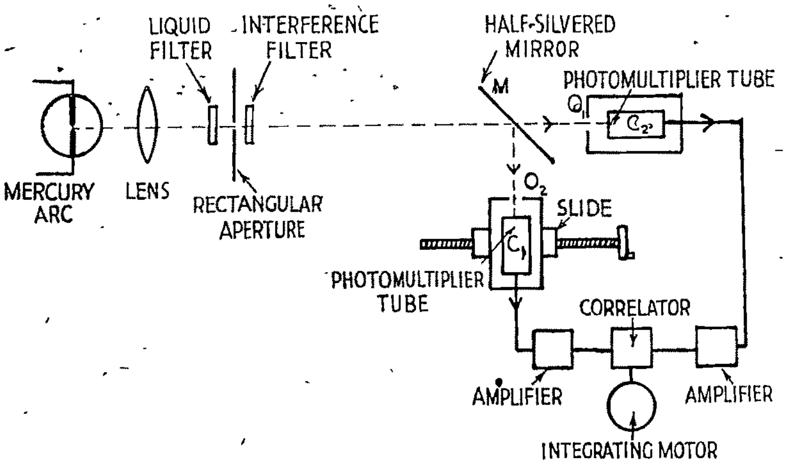

Fig. 2. Simplified diagram of the apparatus

or separated by any amount up to about three times their own width. The fluctuations in the output currents from the photomultipliers were amplified over the band 3–27 Mc./s. and multiplied together in a linear mixer. The average value of the product, which was recorded on the revolution counter of an integrating motor, gave a measure of the correlation in the fluctuations. To obtain a significant result it was necessary to integrate for periods of the order of one hour, so very great care had to be taken in the design of the electronic equipment to eliminate the effects of drift, of interference and of amplifier noise.

Assuming that the probability of emission of a photoelectron is proportional to the square of the amplitude of the incident light, one can use classical electromagnetic wave theory to calculate the correlation between the fluctuations in the current from the two cathodes. On this assumption it can be shown that, with the two cathodes superimposed, the correlation $S(0)$ is given by :

$$S(0) = A.T.b_v.\mathrm{f}\left(\frac{a_1\theta_1\pi}{\lambda_0}\right).\,\mathrm{f}\left(\frac{a_2\theta_2\pi}{\lambda_0}\right)\int \alpha^2(\nu).n_0{}^2(\nu).d\nu \qquad (1)$$

It can also be shown that the associated root-mean-square fluctuations N are given by :

$$N = A.T.\frac{2m}{m-1}.\,b_v\,(b_vT)^{-\frac{1}{2}}\int \alpha(\nu).n_0(\nu).d\nu \qquad (2)$$

where A is a constant of proportionality depending on the amplifier gain, etc. ; T is the time of observation ; $\alpha(\nu)$ is the quantum efficiency of the photocathodes at a frequency ν ; $n_0(\nu)$ is the number of quanta incident on a photocathode per second, per cycle bandwidth ; b_v is the bandwidth of the amplifiers ; $m/(m-1)$ is the familiar excess noise introduced by secondary multiplication ; a_1, a_2 are the horizontal and vertical dimensions of the photocathode apertures ; θ_1, θ_2 are the angular dimensions of the source as viewed from the photocathodes ; and λ_0 is the mean wave-length of the light. The integrals are taken over the complete optical spectrum and the phototubes are assumed to be identical. The factor $\mathrm{f}\left(\frac{a\theta\pi}{\lambda_0}\right)$ is determined by the dimensionless parameter η defined by

$$\eta = a\theta/\lambda_0 \qquad (3)$$

which is a measure of the degree to which the light is coherent over a photocathode. When $\eta \ll 1$, as for a point source, $\mathrm{f}(\eta)$ is effectively unity ; however, in the laboratory experiment it proved convenient to make η_1, η_2 of the order of unity in order to increase the light incident on the cathodes and thereby improve the ratio of signal to noise. The corresponding values of $\mathrm{f}(\eta_1)$, $\mathrm{f}(\eta_2)$ were 0·62 and 0·69 respectively.

When the centres of the cathodes, as viewed from the source, are displaced horizontally by a distance d, the theoretical value of the correlation decreases in a manner dependent upon the dimensionless parameters, η_1 and d/a_1. In the simple case where $\eta_1 \ll 1$, which would apply to an experiment on a visual star, it can be shown that $S(d)$, the correlation as a function of d, is proportional to the square of the Fourier transform of the intensity distribution across the equivalent line source. However, when $\eta \gg 1$, as in the present experiment, the correlation is determined effectively by the apparent overlap of the cathodes and does not depend critically on the actual width of the source. For this reason no attempt was made in the present experiment to measure the apparent angular size of the source.

The initial observations were taken with the photocathodes effectively superimposed ($d = 0$) and with varying intensities of illumination. In all cases a positive correlation was observed which completely disappeared, as expected, when the separation of the photocathodes was large. In these first experiments the quantum efficiency of the photocathodes was too low to give a satisfactory ratio of signal to noise. However, when an improved type of photomultiplier became available with an appreciably higher quantum efficiency, it was possible to make a quantitative test of the theory.

A set of four runs, each of 90 min. duration, was made with the cathodes superimposed ($d = 0$), the counter readings being recorded at 5-min. intervals. From these readings an estimate was made of N_e, the root mean square deviation in the final reading $S(0)$ of the counter, and the observed values of $S_e(0)/N_e$ are shown in column 2 of Table 1. The results are given as a ratio in order to eliminate the factor A in equations (1) and (2), which is affected by changes in the gain of the equipment. For each run the factor

$$\frac{m-1}{m}\int \alpha^2(\nu)n_0{}^2(\nu)d\nu \Big/ \int \alpha(\nu)n_0(\nu)d\nu$$

was determined from measurements of the spectrum of the incident light and of the d.c. current, gain and output noise of the photomultipliers ; the corresponding theoretical values of $S(0)/N$ are shown in the second column of Table 1. In a typical case, the photomultiplier gain was 3 × 10^5, the output current was 140 μamp., the quantum efficiency $\alpha(\nu_0)$ was of the order of 15 per cent and $n_0(\nu_0)$ was of the order of 3×10^{-3}. After each run a comparison run was taken with the centres of the photocathodes, as viewed from the source, separated by twice their width ($d = 2a$), in which position the theoretical

Table 1. COMPARISON BETWEEN THE THEORETICAL AND EXPERIMENTAL VALUES OF THE CORRELATION

	Cathodes superimposed ($d = 0$)		Cathodes separated ($d = 2a = 1{\cdot}8$ cm.)	
	Experimental ratio of correlation to r.m.s. deviation $S_e(0)/N_e$	Theoretical ratio of correlation to r.m.s. deviation $S(0)/N$	Experimental ratio of correlation to r.m.s. deviation $S_e(d)/N_e$	Theoretical ratio of correlation to r.m.s. deviation $S(d)/N$
1	+7·4	+8·4	−0·4	~ 0
2	+6·6	+8·0	+0·5	~ 0
3	+7·6	+8·4	+1·7	~ 0
4	+4·2	+5·2	−0·3	~ 0

correlation is virtually zero. The ratio of $S_e(d)$, the counter reading after 90 minutes, to N_e, the root mean square deviation, is shown in the third column of Table 1.

The results shown in Table 1 confirm that correlation is observed when the cathodes are superimposed but not when they are widely separated. However, it may be noted that the correlations observed with $d=0$ are consistently lower than those predicted theoretically. The discrepancy may not be significant but, if it is real, it was possibly caused by defects in the optical system. In particular, the image of the arc showed striations due to imperfections in the glass bulb of the lamp; this implies that unwanted differential phase-shifts were being introduced which would tend to reduce the observed correlation.

This experiment shows beyond question that the photons in two coherent beams of light are correlated, and that this correlation is preserved in the process of photoelectric emission. Furthermore, the quantitative results are in fair agreement with those predicted by classical electromagnetic wave theory and the correspondence principle. It follows that the fundamental principle of the interferometer represented in Fig. 1*b* is sound, and it is proposed to examine in further detail its application to visual astronomy. The basic mathematical theory together with a description of the electronic apparatus used in the laboratory experiment will be given later.

We thank the Director of Jodrell Bank for making available the necessary facilities, the Superintendent of the Services Electronics Research Laboratory for the loan of equipment, and Mr. J. Rodda, of the Ediswan Co., for the use of two experimental phototubes. One of us wishes to thank the Admiralty for permission to submit this communication for publication. [Oct. 5

OBSERVATIONS OF WHISTLING ATMOSPHERICS AT GEOMAGNETICALLY CONJUGATE POINTS

WE have observed whistlers, most recently described comprehensively by L. R. O. Storey[1], to occur simultaneously at 55·1° and 50·2° N. geomagnetic latitude on the east coast of North America, and have found the individual whistlers to have essentially identical characteristics at the two stations for the particular period of activity studied. All individual whistlers observed at either station were accompanied by a simultaneous occurrence at the other station, but for each occurrence the stronger whistler did not always occur at the same station. Apart from intensity variations, other characteristics were essentially uniform throughout the observing period.

Tape recordings of whistlers simultaneously observed at the two locations, Hanover, N.H., and Washington, D.C., were analysed on a comb-filter type of sound spectrograph, and Figs. 1 and 2 show typical examples taken from more than a hundred occurrences on March 1, 1955, between 09.45 and 10.15, 75° W. standard time. The most probable source of storms for producing these whistlers appears from weather data to have been in the State of New York at a geomagnetic latitude of about 54° N.

The dotted curves plotted on the spectrograms are the function $f = (D/t)^2$, where t is measured from the initiating atmospheric. This formula, which is Storey's form of the frequency-dependence given by Eckersley[2], is seen to fit the data rather well for $D = 200$. The dispersion D as given by Storey's

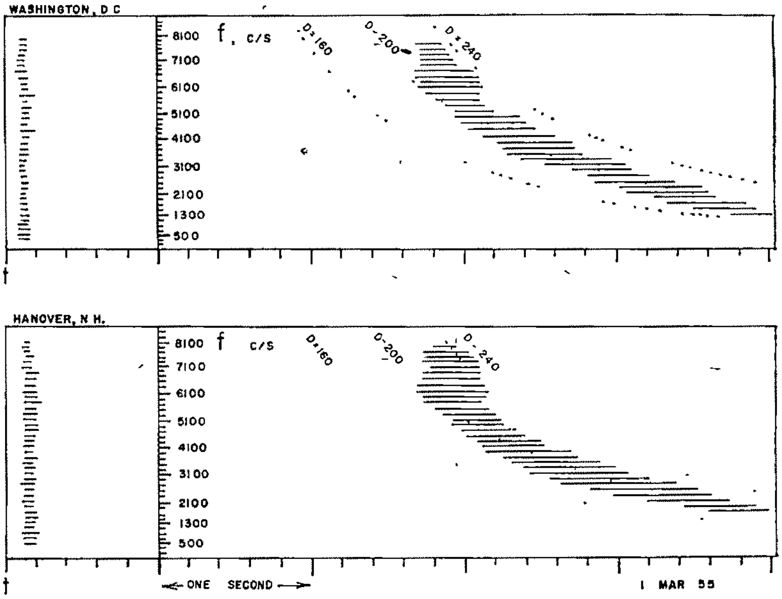

Fig. 1. An atmospheric followed about 2·5 sec. later by the commencement of a whistler. The atmospheric was observed to occur simultaneously at both stations within the limits of the timing method used (about ± 0·1 sec.) and, there being no others of comparable amplitude within a few seconds, is reasonably assumed to be the same atmospheric on both records

equation 15 is proportional to the expression $\sqrt{N}/B\,ds$ integrated over the propagation path, where N is the electron density, B the static magnetic field, and ds the differential path-length. Considering the effect of path-length only, and considering the path to be along the flux of the simple geomagnetic field, a difference of 35·6 per cent in D between the two points of observation is computed. (Inclusion of the field in the integral leads to $\int (1 + 3\cos^2\theta)^{1/4}\sin^3\theta d\theta$, which we have not succeeded in integrating directly.) This difference does not seem to appear in the observations, and we conclude tentatively that the observed dispersion does not necessarily depend upon the latitude of the observer but rather upon the latitude of the storm source. If this conclusion is correct, and if the ability to hear a whistler depends upon the proximity of the observer to the location, or the geomagnetically conjugate location, of the atmospheric generating it, then one would expect the distribution of the dispersions of all whistlers heard at a station to depend upon the latitude of that station. On the other hand, we have never observed whistlers to result from lightning which could be seen from the point of whistler observation.

(*Note added in proof, November* 25. A. G. Jean, of the National Bureau of Standards, Boulder, Colorado, has reported to us in recent conversations that he has on one occasion heard whistlers apparently associated with visible lightning flashes. It should also be recalled that E. T. Burton and E. M. Boardman reported in 1933 a direct correspondence with flashes of undetermined kind seen near the apparent end of an auroral arc[3].)

We have noted that atmospherics which produce whistlers usually have a characteristic sound. Continuing the onomatopœic vocabulary started by E. T. Burton[4], we have called these 'bonks'. There are many gradations between a 'whistler' (a term first used by Eckersley[5]) and a 'swish', a term first used by Burton. The former is a descending tone, whereas the latter is a descending frequency band of noise. We submit that the accompanying records are of bonks followed by swishlers.

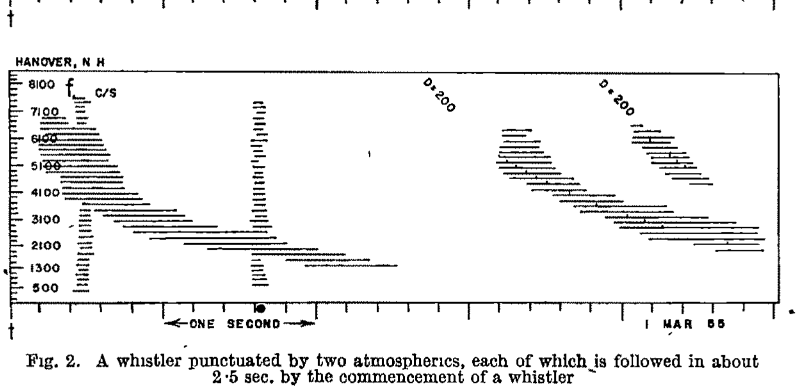

Fig. 2. A whistler punctuated by two atmospherics, each of which is followed in about 2·5 sec. by the commencement of a whistler

We wish to acknowledge the assistance of our colleagues at our respective institutions: H. W. Curtis, W. C. Johnson and B. Pratt at Dartmouth College; and J. E. Raudenbush and W. E. Garner at the Naval Research Laboratory.

[4] Burton, E. T., *Nature*, **126**, 55 (1930).

[5] Eckersley, T. L., *Nature*, **122**, 768 (1928).

Observations which we have conducted near geomagnetically conjugate points at about 50° geomagnetic latitude in the Aleutian Islands and in New Zealand appear to confirm L. R. O. Storey's remarkable theory that the long, dispersive paths needed by T. L. Eckersley to explain the generation of 'whistlers' and 'swishes' from atmospherics are along the geomagnetic flux lines between the northern and southern hemispheres[1,2]. Simultaneous recording on magnetic tape on a schedule of 4 min./3 hr. was begun on August 23, 1955 Z (Z = zero meridian reference), at Unalaska and at sites near Wellington and Dunedin, N.Z. Unalaska and Wellington are within 250 miles of geomagnetically conjugate points, and Unalaska and Dunedin are within 75 miles of such points. Activity at all stations was very low until August 28 at 11.40 Z, when weak whistler activity commenced at all stations. The strength of the activity had increased somewhat by 14.40 Z, and further at 17.40 Z. During the latter schedule, four good examples of whistler trains[2] were observed at both the northern and southern stations. The low rate of occurrence, and the timing accuracy used, were such that there can be little doubt of the correspondence of the phenomena at the northern and southern stations. There were no other occurrences of comparable nature and magnitude at any of the stations during the schedule. Further activity occurred on the 14.40 Z and 17.40 Z schedules on September 1. On that day the occurrences were strong but less-frequent, and the background noise was particularly low.

In the accompanying spectrograms it is seen that the essential details of Storey's theory are amply borne out. The spectrograms are tracings of records

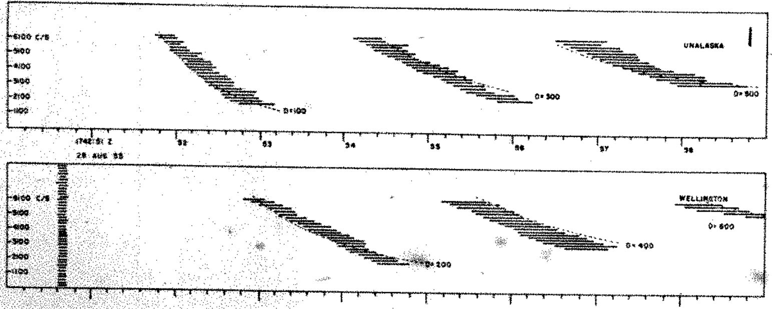

Fig. 1. Atmospheric heard in New Zealand which, according to the Storey theory, produced a whistler in Alaska after being smeared out by propagation over the long dispersive path along the geomagnetic flux lines connecting the two locations. The whistler then returned to New Zealand, further dispersed by another transit of the path, returned to Alaska still further dispersed, etc. The attenuation produced by a round trip is sometimes as low as 2 db.

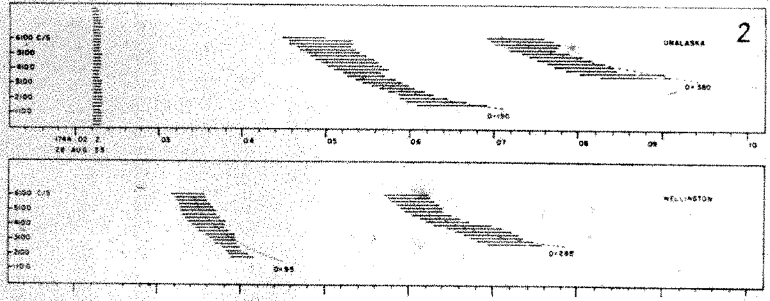

Fig. 2. Atmospheric heard in the Aleutians which produced a whistler in New Zealand, returned to Alaska, etc.

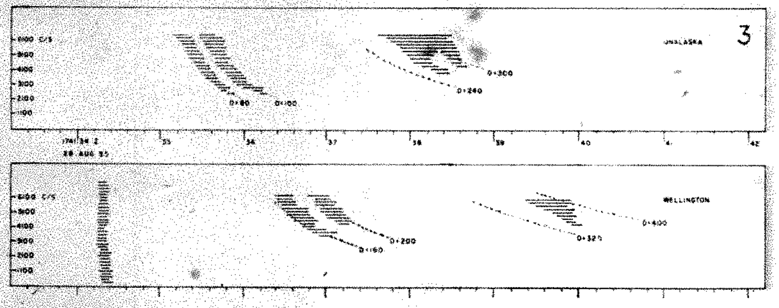

Fig. 3. A whistler pair produced by a single atmospheric. This type, reported by Storey, apparently results from independent propagation over two paths

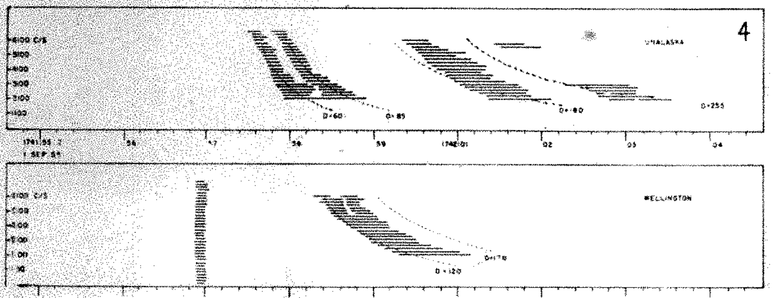

Fig. 4. Another whistler pair produced by a single atmospheric

made with a comb-filter with a stylus for each filter writing on electrically sensitive paper. The values of D shown are from the equation $t = D/\sqrt{f}$, which is Storey's form of the frequency dependence given by Eckersley. The origin of t is taken at the leading edge of the generating spheric in each example.

The estimated timing accuracy was ± 0·3s. at each station for the August 28 schedule at 17.40 Z and ± 0·5s. at each station for the September 1 schedule at 17.40 Z. The times shown on the spectrograms are those determined for the Alaska records. The New Zealand records have been registered as if the performance were according to Storey's theory. This required adjusting the New Zealand times by adding the following amounts: for August 28, 1741.34, 0·2s.; for 1742.51, 0·4s.; and for 1744.02, 0·4s. For September 1, 1741.55, 0·1s. was added.

The Dunedin records have been found to be closely identical with the Wellington records. This is as we would expect from experience in North America, in which simultaneous observations at Washington, D.C., and Hanover, N.H., were compared[3].

The consistence of these results with Storey's theory permits the planning of a synoptic programme of observation during the coming International Geophysical Year with much greater confidence and insight. We are grateful to the U.S. National Academy of Sciences for sponsoring this international scientific experiment and for assisting us with funds obtained from the U.S. National Science Foundation for costs other than salaries. We hope that the successful outcome of the experiment on an informal basis is but a precursor of many others planned for the International Geophysical Year.

We are especially indebted to H. W. Curtis, of Dartmouth College, who established the station and made the observations at Unalaska, to the U.S. Navy's Bureau of Ships for making his time available, to the U.S. Military Air Transport System for his return transportation, and to the Alaska Communication System of the U.S. Army Signal Corps for assistance and hospitality to him at Unalaska. We are also very much indebted to L. H. Martin, of the New Zealand Broadcasting Service, who established the station and made the observations near Dunedin. Lastly, we thank H. E. Dinger, of the U.S. Naval Research Laboratory, for preparation of the original spectrograms, and W. C. Johnson, of Dartmouth College, for their reproduction.

Cosmic Spherules in Deep-Sea Sediments

IN 1876, Sir John Murray[1] published observations on magnetic spherules extracted from deep-sea sediments collected by the *Challenger* Expedition. Together with Renard[2], he later described them more fully and gave strong reasons for assuming them to have a cosmic origin. Very few observations have since then been published on these spherules. The two most recent publications are by Bruun, Langer and Pauly[3] describing magnetic particles collected from the sediment surface by the *Galathea* Expedition, and by Laevastu and Mellis[4], working in Göteborg, who extracted, counted and measured black spherules from one ordinary long core from the Swedish Deep-Sea Expedition.

During the Swedish Deep-Sea Expedition with the *Albatross* a number of thick cores, up to 5½ metres long, were collected from different localities and depths in order to obtain more exact observations on the supply to the Earth of cosmic particles during the past few million years[5]. Some of these cores have, in the Institute of Oceanography in Göteborg, been subjected to magnetic extraction and have yielded, per kilogram of sediment, several hundred black spherules, greater than 35µ in diameter, from different layers in the cores[6].

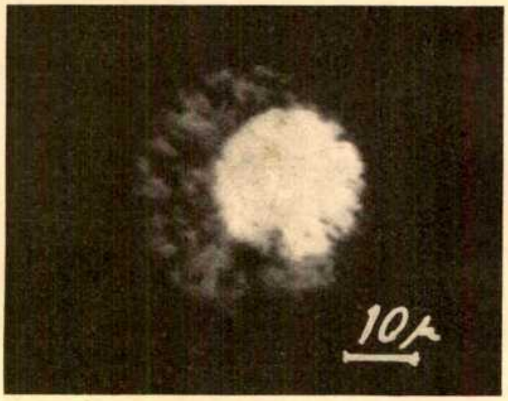

Fig. 1. Spherule from *Albatross* Core 71 (lat. 07° 38′ S., long. 152° 53′ W., depth 4,990 m.). Sample 93, 160 cm. below the sediment surface. Magnetite, grey; metallic nucleus, white

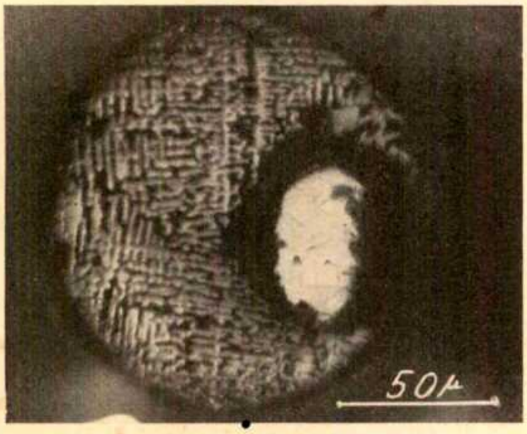

Fig. 2. Spherule from the same sample as Fig. 1. Dendritic magnetite, grey, probably in silicate, and metallic nucleus, white. The black area around the nucleus is void

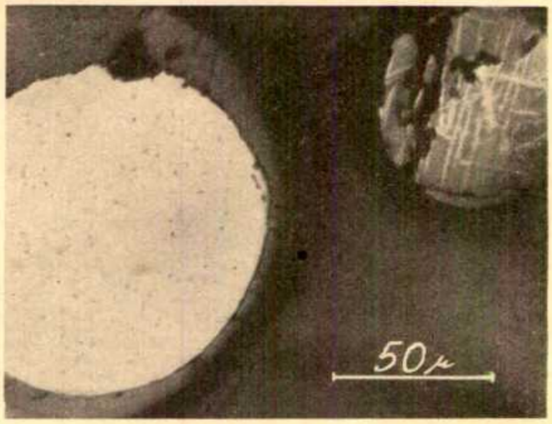

Fig. 3. Artificial spherules. Magnetite, grey; hæmatite lamellæ, light grey; and metallic nucleus, white

Doubts have been expressed about the cosmic origin of these spherules. In the course of our experiments, several of the spherules found have been mounted in plastic and polished, in many cases displaying a metallic nucleus inside a superficial layer of magnetite (Fig. 1), presumably due to oxidation during the flight through the atmosphere. In most of the spherules with a metallic nucleus the metal reduces acid copper sulphate solution, indicating metallic iron. In a few cases a structure, probably due to a consolidation from the molten state, has been observed (Fig. 2). Since a volcanic origin is not likely, this also supports the cosmic origin of the black spherules on which the investigation has hitherto been concentrated.

The possibility that the spherules may in part be of artificial origin cannot *a priori* be excluded for spherules found in the uppermost sediment surface. But for spherules found a few centimetres or more below the surface layer in deep-sea sediments, this origin can be ruled out. In fact, we have found spherules in sediment layers the age of which is of the order of several million years, proving that already in Tertiary time cosmic spherules were being deposited on the Earth.

In interpreting magnetic spherules collected on the continents by, among others, Buddhue and Thomsen[7], great caution is necessary. Hoppe and Zimmermann[8] have published results from attempts to collect magnetic fragments from the air in Jena and other localities, which prove that magnetic spherules found there are largely products from industries in the vicinity. This they assume to have been the case, at least with some of the magnetic spherules described by Thomsen. Similar experiments made in Göteborg confirm this view. We have also found that black magnetic spherules, obtained by means of an oxygen flame from an iron wire, consist of magnetite with or without a metallic nucleus, and that they are very similar to the true cosmic spherules (Fig. 3).

Prof. H. Pettersson has proposed that a collection of meteoritic dust and fragments should be undertaken during the International Geophysical Year, preferably on islands in the Pacific Ocean. Preliminary experiments for this purpose have already been started near Bornö Station in the Gullmar Fjord.

A detailed report on our finds is in preparation.

Enhanced Initiating Effect of Multiple Shock Intersections

PREVIOUS work has shown that underwater shock-wave initiation of cast pentolite can be photographed advantageously by a simple argon flash-lamp method in which a common mechanical-shutter camera is used[1]. Very minute scintillations were usually evident on the detonating pentolite charges, presumably because of the presence of minute air pockets between the particles situated near the surface of the charges. These air pockets probably provided a multitude of initiation centres. Bowden and co-workers have obtained photographic evidence that bubbles in nitroglycerin and air pockets in solid explosives enhance initiation and that initiation occurs at these bubbles or gas pockets[2].

When these results were discussed with Dr. F. P. Bowden, of Cambridge, he suggested to us that initiation of a receptor also might be enhanced by multiple or reinforced shock waves acting simultaneously on the explosive receptor. The arrangement to be described here was used to obtain photographic evidence of such an effect. Commercial nitroglycerin (a mixture of glycerin trinitrate and glycol dinitrate) was selected for the investigation because of uniformity in properties and the normal absence of air bubbles.

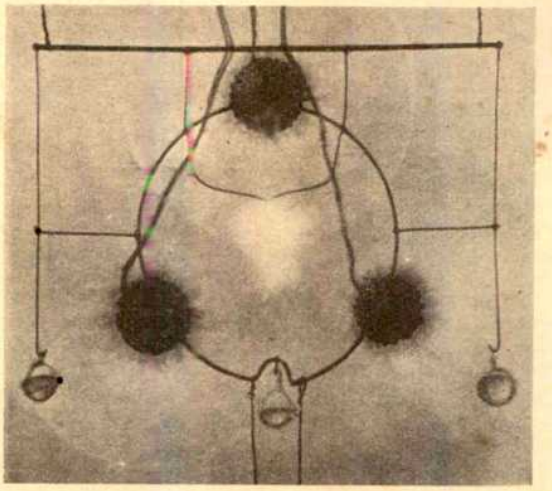

Fig. 2

The arrangement shown in Fig. 1 consisted of four nitroglycerin receptors (A) spaced uniformly about three evenly separated blasting caps (B). About 1·5–2·0 gm. of nitroglycerin was contained in each thin glass bulb, which weighed about 0·2 gm. Two individual receptors, A_2, A_4, were exposed simultaneously to a single shock; one, A_3, to a double intersecting shock; and a third, A_1, to a triple intersecting shock from the three blasting caps fired simultaneously. The location of the individual receptors with respect to the caps determined whether the exposure was to a single, double-intersecting, or triple-intersecting shock. Simultaneous firing of caps in series connexion was obtained by using a special arc-fired cap rather than the usual bridge-wire type. The caps were mounted at equal distances from each other on the central wire ring. The base charge was 5 grains of PETN.

Fig. 2 is an argon flash-lamp picture[3] (back lighted; about 0·5 μsec. exposure; 1/200 sec. shutter) that shows the underwater shock waves when in contact with all receptors, the centres of which were essentially 2½ in. from the nearest caps. Only the central receptor that was exposed to a triple shock intersection was initiated. None of the other receptors was initiated.

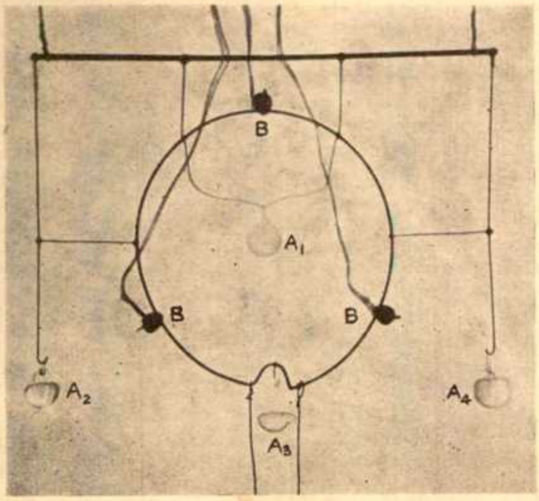

Fig. 1

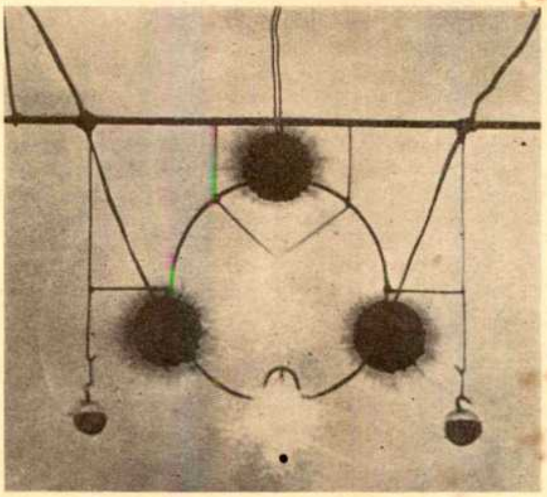

Fig. 3

The arrangement of Fig. 3 was like that of Fig. 2 except that the distance between the caps and the adjacent nitroglycerin receptors was reduced by ½ in., and that the picture was taken sooner to show again the simultaneous shock influence. In this case the receptors that were exposed to triple- and double-intersecting shocks were initiated. The receptors that were exposed to the singly arriving shocks from the caps did not explode.

When explosion of the receptor is accompanied by a brilliant flash, it is not possible to determine the instant of initiation, because the brilliant flash obscures the state of gas expansion and the location of the shock wave about the receptor. With less luminous receptors the simple flash method provides much information about underwater shock-wave initiation. When nitroglycerin is used, some detailed information is lost, and accordingly future work is planned with a Kerr-cell, rapid-shutter camera. It is clear, however, that weak shock waves which are unable singly to initiate explosion can do so when they meet and reinforce one another.

I greatly appreciate the suggestions kindly given by Dr. F. P. Bowden.

Microwave Observation of Detonation

THE usual methods for the measurement of the detonation velocity of explosives either do not permit the free selection of conditions of confinement or do not permit the observation of velocity with a high degree of continuity[1].

We have recently developed a technique for measuring the velocity of detonation of various high explosives under contained conditions by means of the reflexion of microwaves from a region travelling with the detonation front. The technique differs substantially from that of Koch[2] and the recent development of his technique by Cook, Doran and Morris[3], in both of which the explosive is unconfined and reflexion occurs in part from the detonation front and in part from the detonation products.

Our experimental method employs the principles of microwave interferometry[4], together with continuous recording of the intensity of the interference field at a point as the detonation moves along the containing tube. In the primitive form of apparatus, a standard brass mould stemmed with explosive is connected, through a polytetrafluorethylene window, to the end section of a rectangular *Q*-band wave-guide, thus forming the variable arm of the interferometer. The wave is guided over the whole forward and return path. The explosive is initiated from the distant end of the stemming, and the interference pattern is recorded together with time markers.

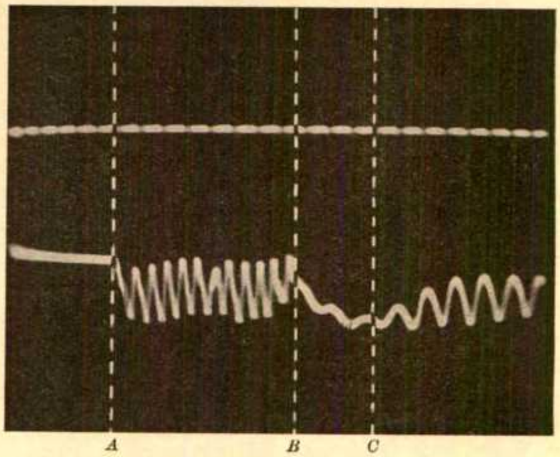

Fig. 1. An oscillogram showing complete detonation in tetryl, the penetration of a polytetrafluorethylene window and the subsequent event in the rectangular wave-guide

A typical oscillograph record of the pattern is shown in Fig. 1. This is for a stable detonation in a 0·6 in. external diameter brass mould of a 2 in. × 0·152 in. diameter stemming of 1·39 gm.cm.$^{-3}$ tetryl. The trace from *A* to *B* corresponds to the progress of the detonation in the explosive stemming; *B* to *C* represents the bursting of the polytetrafluorethylene window and the reforming of an adequate reflexion front in the rectangular wave-guide. The remaining portion of the trace is due to reflexion occurring in the rectangular wave-guide from the shock front, or perhaps from the detonation products travelling with a considerably reduced velocity. The time base shows microsecond marker intervals. For this particular case the detonation velocity derived from the oscillogram is about 6,600 m.sec.$^{-1}$ and the velocity of the front in the wave-guide after detonation is about 3,600 m.sec.$^{-1}$.

To derive the velocities from the oscillogram, all that is required is a knowledge of the guide wavelength appropriate to the region. For the case of the detonation velocity determination, in addition to the microwave frequency, the dielectric properties (permittivity and loss factor) of the explosive must be known. Measurements of these properties have been made over a range of densities by the usual cavity techniques for a number of high explosives. In all cases the loss factors are sufficiently low to cause no appreciable attenuation. In the example given above the relative permittivity was 2·73, and the microwave frequency was 34·50 kMc.

While no extensive detonation velocity determinations have yet been made by us, an estimate of the likely error for the initial form of the equipment indicates that the detonation velocity determined should lie within ± 1½ per cent of the true value. This error is of much the same order as the errors in other methods. It will be clear, however, that since the reflexion arises entirely from the interior of the explosive, the main advantage of the new method does not derive so much from the ability to measure detonation velocities with great absolute accuracy, as from its other possibilities. These include the observation of relative variations due to density, diameter or confinement, the observation of contact transmission, instability and other effects under confined conditions, and the avoidance of external effects during detonation from luminosity, shock-waves or detonation products. Any degree of confinement may be used, from very thin metal foils upward, and other materials may be used with thin internal metal deposits.

In the oscillograms obtained it is easy to discriminate four phase points in each period, and thus a definite distance from some arbitrary fixed point in the explosive is located at about every millimetre in the example discussed. This distance defines the degree of continuity in the present observations, but developments in the recording system are immediately possible and a finer distance resolution will result.

Full details of the method and associated dielectric measurements will be given elsewhere. This communication is published by permission of the Chief Scientist, Australian Commonwealth Department of Supply.

Search for Point Source of Cosmic Rays

IN order to search for possible point sources of cosmic rays, an alt-azimuth Geiger–Müller counter telescope of narrow angular resolution (5° × 5°) was made, and kept nearly horizontal (zenith distance $Z = 80°$) so that the effective cosmic-ray particles were free from complicated geomagnetic deflexion. After scanning over the celestial sphere, especially large intensities were observed at two positions as noticed in our earlier paper[1].

In order to confirm one of them (declination $\delta = 0°$, right ascension $\alpha = 5$h. 30m., before entering into the geomagnetic field), observations of a small part of the celestial sphere including the position have been repeated since April 1954, with the telescope (No. 1) described above. Meanwhile, another telescope (No. 2) with higher accuracy was built, which can observe five adjacent declination bands at once with narrow angular resolution (4° × 5°). Observations with two telescopes have been repeated since July 13, 1955. Observations were carried out at the zenith distance $Z = 80°$, twice a day at two azimuths, $A = 85°$ and $A = 255°$, respectively. The following results were obtained from the observations up to August 18, 1955.

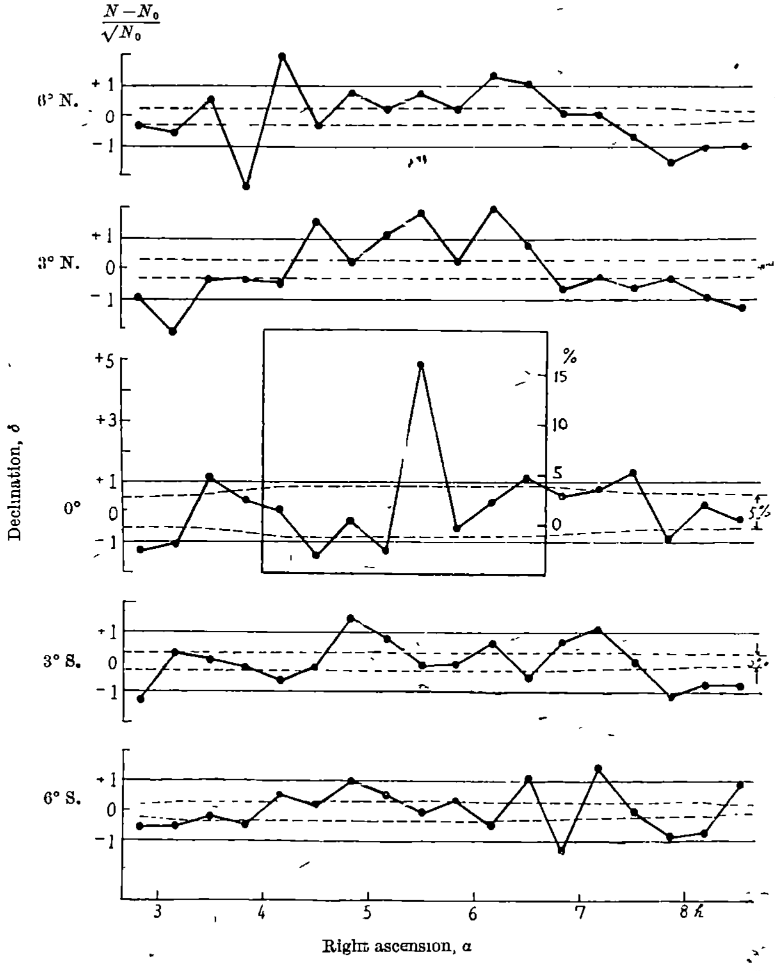
The relative intensities in the part of the celestial sphere ($\delta = 0°$, 4h. 10m. $< \alpha <$ 6h. 30m.) are shown in the central part of Fig. 1, where the eight points were observed with equal statistical accuracy. The count at the position marked by the previous scanning ($\alpha = 5$h. 30m.) is $N = 1{,}264$, while the average of the other seven positions is $N_0 = 1{,}091{\cdot}6$. Therefore,

$$N - N_0 = +0{\cdot}157\,N_0 = +5{\cdot}2\sqrt{N_0}$$

or the significance-level is about 10^{-6}. Thus, this position was confirmed to be a point source of cosmic rays. This is the first example of a particular point source, though the existence of point sources was presumed through the statistical arguments in our previous paper[1].

The results over a little larger part of the celestial sphere are shown in Fig. 1, where the statistical accuracies corresponding to the various points are not constant. Therefore, the ordinate is not the relative count $(N - N_0)/N_0$, but the count divided by the standard deviation corresponding to the observation of each point, $(N - N_0)/\sqrt{N_0}$, where N_0 is not constant. From the observations up to August 18, no point source except that described above was found in the part of the celestial sphere shown in the figure, provided that fluctuations less than 2·5 standard deviations are regarded as insignificant.

The increase at the point source was 20 ± 8 per cent by telescope No. 2, which includes no effect of side showers. It was 19 ± 4 per cent by telescope No. 1, after correction for the side showers. Thus, the intensity of cosmic rays from the point source is 20 ± 4 per cent of the background cosmic rays in the solid angle 5° × 5°, so the point source con-



Right ascension, α

Fig. 1. A part of the celestial sphere observed with alt-azimuth cosmic-ray telescopes Ordinates: $(N-N_0)/\sqrt{N_0}$. In the central part of the figure, where observations were made with high and uniform accuracy, the ordinate is scaled also by $(N-N_0)/N_0$ Horizontal lines: $N-N_0 = \pm\sqrt{N_0}$. Dotted curves: $(N-N_0)/N_0 = \pm 2{\cdot}5$ per cent

tributes 0·016 per cent of total cosmic rays in the same energy region. The angular width of the point source was estimated by various methods to be not more than 5°. Increase of cosmic rays at the position was observed at both azimuths. Positions observed at the two azimuths were identified through the correction for the geomagnetic deflexion, which depends on the charge and momentum of effective primary particles. They were presumed statistically to be positive and 2 Størmers ($P \doteqdot 240$ GeV./c.) respectively by the previous scanning, and were shown to be correct through the observation of this particular point source.

The Near Ultra-Violet Bands of *para*-Dichlorobenzene

The bands in the near ultra-violet of *p*-dichlorobenzene were first studied in absorption by Wollman and reported by H. Sponer[1], who gave a general analysis and description of the bands. Recently, T. Anno and T. Matubara[2] have published a detailed analysis of these absorption bands obtained at different temperatures. Work on these bands, in absorption as well as in emission, has been in progress in this laboratory for some time past. Comparison of our results with those of earlier workers is thought worthy of advance publication, since the spectrum has also been obtained in emission and there are a few interesting points of difference in analysis.

The position of the zero band as measured by us is 35,755 cm.$^{-1}$ in absorption and 35,752 cm.$^{-1}$ in emission. The divergence is within experimental error. The value is again in agreement with that in absorption reported by Anno and Matubara, namely, 35,750 cm.$^{-1}$, but differs from that given by Sponer, namely, 35,743 cm.$^{-1}$.

The main progression, which consists of doublet bands, involves the upper-state frequencies near 1,061 and 1,051. Anno and Matubara correlate these frequencies with the ground-state frequencies 1,164 and 1,102 respectively, observed in absorption and Raman effect. But in the emission spectrum obtained by us, there is a broad band at 34,672 cm.$^{-1}$, which perhaps represents two unresolved bands involving the ground-state frequencies 1,084 and 1,071. The ground-state frequencies 1,164 and 1,102 do not seem to occur in the emission spectrum. Further, from the polarization measurements of the Raman lines, Saxena and Narain[3] suggest that perhaps 1,084 and 1,071 form a Fermi doublet. Thus the data of the emission spectrum and the intensity and polarization of the Raman lines appear to favour the correlation of the upper-state frequencies 1,061 and 1,051 to the ground-state frequencies 1,084 and 1,071 rather than to 1,164 and 1,102 respectively.

The ground-state frequency 248 observed by us and also by Anno and Matubara does not seem to have a corresponding Raman line, unless it is a very faint line at 232 cm.$^{-1}$ reported by Kohlrausch and Paulsen[4] (and referred to by Sponer and Nordheim[5]). In emission, there is a band of medium intensity on the longer wave-length side of the zero band at a separation of 251 cm.$^{-1}$. This band probably corresponds to the ground-state frequency 248 observed in absorption.

The totally symmetric ground-state frequency 331 is correlated with 244 in the excited state by Anno and Matubara. But the intensity of the band involving the frequency 244 is low, and although this is not, by itself, an argument against its being totally symmetric, we prefer to regard it as a satellite of the band involving the upper-state frequency 329. This assignment has also been suggested as an alternative one by Anno and Matubara.

The prominent difference-frequencies of about 25 and 85 are observed by all workers. Of the other difference-frequencies 9 and 16 reported by Anno and Matubara, only the first occurs in association with weak bands on our plates, while there is no trace of the bands involving the difference-frequency 16. This is no doubt due to the fact that we restricted our studies to room temperature, about 30° C., where this difference-frequency is either absent or very weak[2].

The occurrence of the ground-state frequencies 302 and 486 is regarded as rather uncertain by us, as the bands involving these frequencies can have alternative assignments.

A detailed treatment of the bands obtained in absorption and emission is to be published elsewhere.

Correlation of Nuclear Quadrupole Interaction Frequencies with Polarographic Half-Wave Potentials

When the nuclear quadrupole interaction frequencies of some aryl iodo-compounds are plotted against the corresponding half-wave potentials of these compounds at *p*H 7 (Fig. 1) a general linear

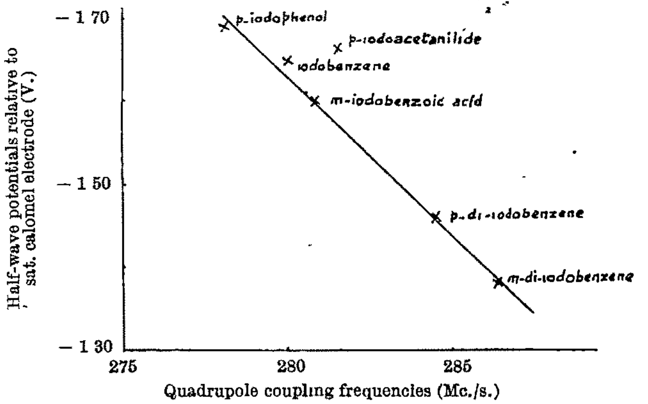

Fig. 1

trend is obvious; but the departure from linearity in the case of the iodoanilines is more serious (points not shown on graph). The data are taken from results obtained by E. Gergely and me[1], those of Colichman and Liu[2], and the quadrupole interaction measurements of Hatton and Rollin[3], and of Barnes, Miller and Wooten[4]. Colichman and Liu have attempted a correlation of their polarographic data on iodo-compounds with Hammett's σ-function. Hatton and Rollin have attempted a similar correlation of their quadrupole data and Hammett's σ for bromine and iodine compounds. However, Colichman and Liu found the same misbehaviour of *p*-iodoaniline as we did, and it is equally obvious that the *m*- and *p*-di-iodobenzenes (as evidenced from our own results which are not substantially different from theirs) would not fit their straight line. On the other hand, Hatton and Rollin found, in their quadrupole $-\ \sigma$ relationship, that these three substances fell very well into line. It is clear that the triangular agreement we expect to find from the results of these four groups of workers is very imperfect, and the interrelation of the three phenomena greatly in need of clarification.

Quadrupole resonances are invariably measured with the substances studied in the crystalline form, whereas polarographic studies and reaction kinetics are undertaken in solution. This distinction is only of importance when crystal forces can seriously modify the nature of the bonding of the relevant atom. At least we know the nucleus is moving in a crystalline, electric field, different sometimes from that where the molecule is gaseous or in the dissolved, liquid state. Moreover, change of vibrational level can modify the quadrupole frequency[5].

Hammett's[6] σ, defined as $-A/2{\cdot}303\ R$, is said to measure the tendency of the substituent to displace electrons. A has the dimensions of an energy term, and might be expected to represent a variation in some energy of activation necessary to overcome a potential barrier[7]. The same is true of the half-wave potential, although the idea behind this may be more elementary, involving the conception of an electron adding on to a molecule as a preliminary step in cathodic reduction. We would say that the greater the electron density at the region where the electron is expected to add on, the greater would be the half-wave potential.

Variations in the quadrupole frequency (or the quadrupole coupling constant, 20/3 times the first frequency in the case of iodine[7]) are due to changes in the asymmetry of the field modifying the nuclear motion. The half-wave potential may be regarded as some measure of the field in a region remote from the nucleus, but its variations may be of the same order as the variations in quadrupole frequency. I hope to accumulate more observations to test the relationships described in this communication, which, at present, must be regarded as forming the basis of only tentative hypotheses.

Crystal Structure of Glycyl-L-Alanine Hydrochloride

In the course of a programme of research into the crystal structures of simple synthetic peptides undertaken in the laboratories of the Wool Industries Research Association, glycyl-L-alanine has been synthesized and the structure of its hydrochloride elucidated using two-dimensional methods. As indicated in an earlier communication[1], the hydrochloride and hydrobromide of glycyl-L-alanine are isomorphous, with the following cell constants:

	Hydrochloride	Hydrobromide
a (A.)	10·62	10·69
b (A.)	5·98	6·13
c (A.)	7·57	7·63
β	109° 2′	108° 36′

and from the systematic absences observed the space group may be inferred to be P_{2_1}. The density of the hydrochloride by flotation is 1·465 gm. cm.$^{-3}$, which necessitates the presence of two molecules of peptide and two molecules of water of crystallization in the unit cell. The existence of the latter was confirmed analytically.

The general features of the structure in projection along the *b*-axis had already been determined for the hydrobromide[1], and the atomic co-ordinates were refined by successive Fourier syntheses using the hydrochloride intensity data (reliability index 0·18).

From the various atomic arrangements possible along the *c*-axis, it was not found possible to select the correct one on the basis of a limited number of structure-factor calculations. However, the final choice was readily made by consideration of the double Fourier projection as employed by Bijvoet *et al.*[2], and Smits and Wiebenga[3]. The *hk*0 intensities of the hydrobromide and hydrochloride were employed to derive the phase angles with a sign ambiguity, and the structure factors were then inserted into the synthesis with both signs thereby obtaining a projection of the correct structure together with its mirror image. Successive applications of the least-squares method to the selected structure in order to minimize $F_0{}^2 - F_c{}^2$ improved the percentage agreement rapidly from 30 per cent to 13·7 per cent.

Comparison of the *x*-co-ordinates obtained from the (010) and (001) projections gave a probable error of 0·02 A. for atoms resolved in both projections. The poor resolution observed in the *c*-axis projection necessarily limits the accuracy of certain of the calculated bond-lengths and angles; but the values obtained are in good agreement with those observed in related structures (Fig. 1).

The dimensions of the amide group accord closely with those given by Corey and Pauling[4], and it is in the *trans* configuration. It shows, however, a significant departure from planarity, since the carbonyl oxygen is 0·5 A. out of the plane containing the remaining atoms of the amide group.

The glycyl-L-alanine molecules are hydrogen-bonded into continuous spirals by the water molecules, which form two hydrogen bonds of 2·77 A. and 2·62 A. with O_1 and O'_4 (Fig. 1). The angle between them is 105°. These spirals are joined laterally by other N—H . . . O and N—H . . . Cl bonds.

The Cl^- ion is surrounded by an approximately tetrahedral disposition of three terminal —NH_3^+ groups and a nitrogen atom in the amide group of an adjacent molecule all at distances of between 3·23 A. and 3·36 A.; that is, within the required limits for hydrogen bonding. The terminal —NH_3^+

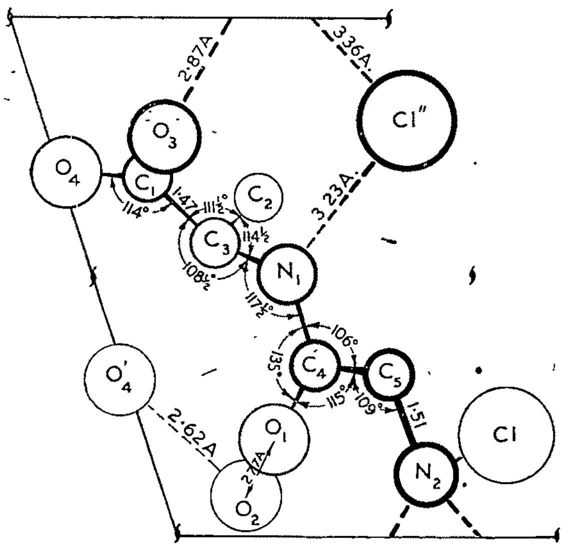

Fig. 1. Bond-lengths and -angles :

C_1O_4	1·26 A.	C_4O_1	1·21 A.	$\angle O_4C_1O_3$	123°
C_1O_3	1·24 A.	C_4C_5	1·52 A.	$\angle O_3C_1C_3$	125°
C_3N_1	1·50 A.	N_2Cl	3·18 A.	$\angle O_1O_2O'_4$	105°
C_4N_1	1 32 A.				

group, therefore, participates in the formation of three hydrogen bonds with surrounding Cl^- ions and forms a fourth N . . . H—O bond of 2·87 A. with the carboxyl group of a neighbouring molecule.

The structure conforms with Donohue's postulate[5] concerning the maximum use of the hydrogen-bonding capacities of the NH and OH groups present in the molecule for structures of this type.

A detailed account of this structure will be presented elsewhere. I am grateful to the Director and Council of the Wool Industries Research Association for permission to publish these results, and to the British Nylon Spinners, Ltd., for the facilities afforded for the completion of the work.

A New Method for determining Ketohexoses in the Presence of Aldohexoses

A slightly modified anthrone method[1,2] has been described[3] which is suitable for the quantitative estimation of carbohydrate in chromatographic fractions. 10 ml. of a 0·02 per cent (w/v) solution of anthrone in 70 per cent (v/v) sulphuric acid is mixed with 1 ml. of the test solution, heated for 7·5 min. in a boiling water-bath and the optical density of the cooled solution read at 625 mμ against a blank. When solutions containing sucrose were analysed by this method, it was noted that, if the mixed solutions were allowed to stand before heating, there was a slow development of colour in the cold that was not apparent with solutions of aldohexoses or of oligosaccharides built up of aldohexose units. Table 1 gives a quantitative picture of the observed differences.

Table 1. Increase in the Optical Density at 625 mμ of Mixtures of Sugar Solution and Anthrone Reagent allowed to Stand at 15° C. (Coleman Universal Spectrophotometer, 1 cm. Light-Path).

Sugar	Molarity	Time elapsed after mixing (min.)		
		20	40	60
Glucose	0 02	0 01	0·01	0 02
Galactose	0·002	0·01	0·01	0·01
Mannose	0·002	0·01	0 01	0·01
Maltose	0 02	0 01	0·02	0·03
Lactose	0·002	0·01	0 01	0·01
Cellobiose	0·02	0 01	0·01	0·02
Sorbose	0·002	0 11	0·19	0·27
Fructose	0 002	0·17	0·31	0·41
Sucrose	0·002	0·17	0·31	0 45
Turanose	0·002	0·23	0·39	0·56
Raffinose	0·002	0·15	0 27	0·41
Melezitose	0 002	0·19	0·36	0·52
Xylose	0·02	0·06	0·12	0·17
Arabinose	0·002	0·01	0·01	0·02
Ribose	0·002	0·01	0 01	0 02
Rhamnose	0·02	0 12	0·18	0·23
Glucurone	0·002	0 01	0 01	0·01
Galacturonic acid	0·02	0·01	0 01	0·02
Glucosamine HCl	0·02	0 01	0·01	0 01
N-Acetylglucosamine	0·002	0 01	0·01	0·01
Heptose	0 002	0·01	0·01	0·01
Digitoxose	0·002	0 07	0·08	0·08

The temperature of the mixed reactant solutions in a 0·75-in. 'Pyrex' test-tube rose from 17° to 33° C.; but this heat of mixing was almost totally dissipated after 15 min., whereas the optical density continued to increase for periods up to 24 hr.

The blue-green colour developed by the rhamnose and pentose solutions in the cold showed a similar absorption maximum (about 625 mμ) to that from the ketose solutions. The digitoxose solutions rapidly developed a golden-brown colour with an absorption maximum at about 470 mμ, some half the final optical density being attained 1 min. after mixing. This reaction appears to be characteristic of 2-deoxy sugars, since deoxyribonucleic acid solutions slowly develop a similar colour in the cold whereas ribonucleic acid solutions do not. Moderate excess of ribonucleic acid has no influence on colour development by deoxyribonucleic acid solutions.

It is apparent that in the absence of methylpentoses, excess of pentoses (ten-fold excess of xylose over fructose gave a 40 per cent error) and large excess of aldohexoses (fifty-fold excess of glucose over fructose gave a 15 per cent error) this method

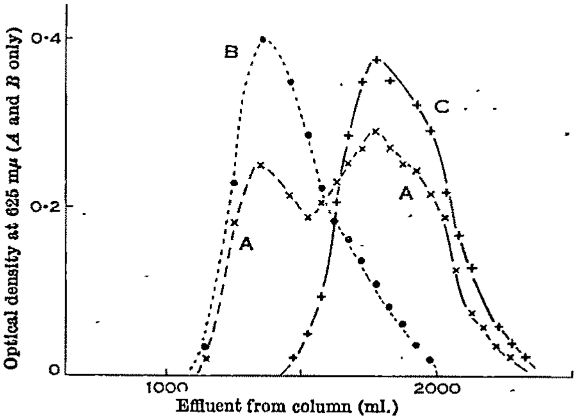

Fig. 1. Curve *A*, total carbohydrate by hot anthrone technique (fractions diluted 1 in 15). Curve *B*, ketose by cold anthrone technique (undiluted fractions, 20 min. standing). Curve *C*, reducing sugar (ref. 4)

may be used for giving a quantitative estimate of ketohexoses and their derivatives. Optical density at 625 mμ is proportional to ketose concentration in the range 0·001–0·003 *M*. The method is less sensitive than the estimation of total carbohydrate by heating, but in the system investigated (elution of sugars from charcoal columns) the concentration of sugars in the fractions was sufficient to give satisfactory results. Fig. 1 shows the application of the method to the incompletely resolved peaks of sucrose and lactose eluted from a charcoal column.

Enzymatic Identification of the Anthocyanin Pigment of Blackberry

Karrer and Pieper reported in 1930 that the principal pigment of blackberry, *Rubus fructicosus* L., was either identical or isomeric with chrysanthemin or cyanidin-3-β-monoglucoside[1]. They obtained compact polyhedral rhombs of a pigment chloride which was indistinguishable in colour properties from an authentic sample of chrysanthemin chloride, and differed from it only in respect of crystal form. Natural chrysanthemin chloride from *Chrysanthemum indicum* L.[2], and the chloride of synthetic cyanidin-3-β-monoglucoside[3] were known to crystallize in diamond-shaped leaflets. It was suggested that the observed difference might be due to traces of impurity in the product from blackberry[1]. Afterwards, blackberry was shown to contain a second unidentified anthocyanin by paper chromatography[4]. More recently, I have isolated from blackberry[5] a crystalline anthocyanin chloride, essentially free from the second minor-component. The product was obtained in leaflets, and appeared to bear a reasonable resemblance to the crystals of chrysanthemin chloride shown in a published microphotograph[2]. However, an air-dried sample of this material was analysed correctly as a monohydrate[5], while chrysanthemin chloride crystals had previously been found to contain 1½ moles of water of crystallization[2,3]. No analysis for an air-dried sample was provided by Karrer and Pieper[1].

The data available[1,5] indicate conclusively that the anthocyanin from blackberry is a cyanidin-3-monoglucoside. Its identity with chrysanthemin would require that it be a β-glucoside. Confirmation on this point, however, appeared desirable in the light of results acquired in a study on the decolorization of berry fruit anthocyanins by fungal enzymes. It was found that the process involved, first, an enzymatic hydrolysis of the anthocyanin to anthocyanidin and sugar, and secondly, a spontaneous conversion of the aglucone into colourless derivatives[5]. Thus, if the blackberry pigment were actually a β-glucoside, the classical β-glucosidase of almond emulsin, which is capable of hydrolysing a variety of phenolic β-glucosides[6], would be expected to be an effective decolorizing agent. Emulsin, nevertheless, was found to have no measurable decolorizing action on blackberry anthocyanin.

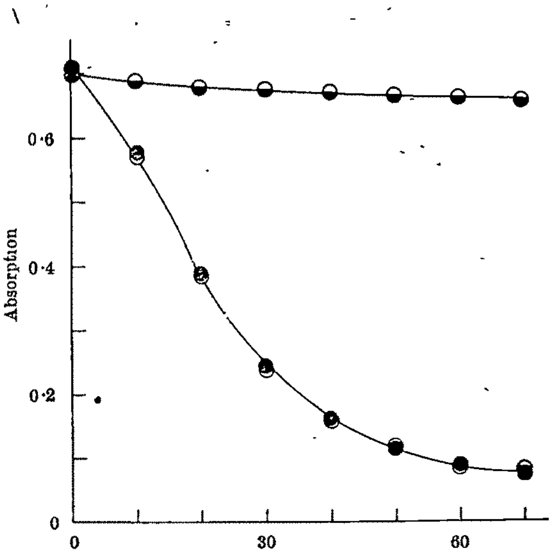

Fig. 1. Effect of anthocyanase *CN* 558 and emulsin β-glucosidase on blackberry anthocyanin and synthetic chrysanthemin. Each optically calibrated tube contained 1·10 μmole pigment and enzyme in 5 ml. of 0·045 *M* sodium lactate buffer at *p*H 3 95. The tubes were incubated at 30° C. and readings of the absorption at 510 mμ made at intervals as indicated. ⊙, Synthetic chrysanthemin and 1 mgm. of *CN* 558; ●, blackberry anthocyanin and 1 mgm. of *CN* 558; ◒, either pigment and 1 mgm. emulsin. Under the same conditions of enzyme, substrate and buffer concentration, hydrolysis of salicin by emulsin was 42 per cent. in 60 min.

It was possible to resolve the nature of this apparent discrepancy when a specimen of synthetic cyanidin-3-β-monoglucoside chloride became available. Equimolar quantities of the synthetic pigment and the blackberry product were each subjected to the action of anthocyanase *CN* 558 and of almond emulsin respectively. Both samples were dried at 50° C. *in vacuo* for 24 hr., and used in the anhydrous state. The enzyme preparations and experimental conditions were the same as those described previously[5]. The results are summarized in Fig. 1. The curves for the decolorization of the natural and synthetic pigments by *CN* 558 are evidently identical. They demonstrate conclusively, therefore, that the blackberry anthocyanin is chrysanthemin. Differences in crystal form and amount of water of crystallization noted earlier are consequently of minor importance. Furthermore, Fig. 1 shows that neither sample is attacked by emulsin. Lack of hydrolysis is accordingly a manifestation of the inherent specificity of emulsin β-glucosidase, and need not be taken as indicating the possibility that the glucosidic linkages in the substrates might be in the α-configuration.

I thank Sir Robert Robinson for the gift of a sample of synthetic chrysanthemin chloride.

Blood Groups of Brazilian Indians (Carajás)

The Carajás Indians of Bananal Island, found by Golden[1] to include 51 per cent of persons of group *B*, are exceptional among South American Indians, who all belong to group *O*. The late Dr. E. M. da Silva died while working among the Carajás. He found the following distribution, in 113 of them:

$$O = 104; \quad A = 1; \quad B = 3; \quad AB = 5.$$

Such an incidence is impossible; but it shows that the Carajás do not possess a high percentage of group *B*. Golden, as well as da Silva, used slide methods, which are not suitable for testing anæmic people. Last July one of us (P. C. J.) went to the Carajás village and bled sixty-six Indians. The tests were made in our laboratory in Rio de Janeiro for the following blood-group systems: *ABO*, *Rh-Hr*, *MNS*, *P*, *Kell*, *Duffy*, *Lutheran* and *Lewis*. The complete results will be published elsewhere, after we have tested larger numbers of people; but two points are of special interest. The first is that all sixty-six Indians tested with anti-*A*, anti-*B* and anti-*AB* sera, by the minimum volume technique, belonged to group *O*. Using slide tests, we obtained doubtful results with the same bloods. This probably accounts for Golden and da Silva's results. The second point is related to the *Duffy* system: among fifty-five Indians we found twenty-three *Duffy* positives. This observation seems important, since it is contrary to the results of Pantin and Junqueira[2] among other Brazilian Indians, and it indicates a lower incidence than those obtained by Pantin and Kallsen[3], and several others working on North American Indians.

This work was made possible by the co-operation of the Serviço de Proteção aos Indios and the Brazilian Air Force, to which we are very grateful. We should like to thank Hetty Brendel, nurse at Bananal Island, for help in examining the Indians.

The *Diego* Blood Factor

In 1953 a new low-incidence blood factor, *Diego* or Di^a, responsible for hæmolytic disease, was described with the aid of an antibody produced by a mother living in Caracas, Venezuela[1,2]. The antibody, anti-Di^a, reacted with the blood of the affected child (propositus) and two of the three siblings of generation IV. The blood factor was also present in the father and three of his six siblings of generation III. The factor was transmitted to them by the paternal grandmother (generation II) of the propositus, who received it from her mother of generation I. The factor was present in the blood of nine out of twenty-nine members of the Diego family tested.

The antibody reacted only in the indirect antiglobulin test to a titre of 1 : 512. Anti-Di^a failed to react with the red cells of a thousand group *O* individuals living in the United States—mainly caucasoids.

Study of the antigens for Di^a, *ABO*, *MNSs*, *Rh*, *Kk*, Fy^a, Jk^a, Le^a and *P* in this family failed to reveal obvious linkage. Nor was there any linkage to the sex chromosome.

More recently, it became possible to demonstrate that Di^a was serologically independent of seven other low-incidence blood factors (Mi^a, *Ven*, *Ca*, Be^a, Wr^a, By^a, *Rm*) among the twelve listed by Hart, Bosman and Van Loghem[3]. (Levine and Robinson demonstrated duplication in the list of the Dutch investigators because V^w was shown to be identical with Mi^a (Miltenberger).) The factor was also independent of the following: C^w, C^x, E^w, *He* and *V*. Nor was there any demonstrable serological or genetical relationship to such high-incidence blood factors as *H* (for group *O*), *U*, *Vel* or Tj^a. These facts could be established in tests with the rare essential antibodies and selected test cells preserved in the frozen state.

In the course of the studies of the four generations of the Diego family, it was observed by Layrisse and Arends that some of them showed physical features indicative of admixture with native Indians. Accordingly, studies were carried out on caucasoids and Indians living in Venezuela[4]. The results of their tests on the Venezuelan Indians have been briefly discussed by Layrisse, M., and Arends, T. ("A High Incidence Blood-Group found in Venezuelan Indians" (in the press)). These findings, including those with the thousand caucasoids of the United States and forty-eight Indians of Brazil[5], are presented in Table 1.

Table 1. Incidence of Di^a

Population tested	No. tested	No positive	Per cent positive
Caucasoid, United States	1,000	0	0
Random, Caracas	266	6	2·3
Random, Barcelona, Venezuela	61	2	3·3
Caribe Indians—Cachama	121	43	35·5
Arawaco Indians	152	8	5·3
Mixed Negroes, Venezuela	150	11	7·3
Kainganges Indians, Brazil	48	26	54·2

The studies with Venezuelan population were made by Layrisse, Arends and Sisco[4]. The anti-Di^a serum for the study of the Brazilian Indians was made available to Fernandez *et al.*[5] by Dr. Layrisse.

Among the forty-nine individuals in the Aribe group of the Caribe Indians, there were two large families many of whom were Di^a-negative, and Layrisse *et al.*[4] offer this as an explanation for the lower incidence of Di^a as compared to that of the Cachama group. Among the 170 members of both groups all but one were in group *O* and all were *Rh*-positive.

The occurrence of the blood factor in caucasoids of Venezuela is apparently indicative of admixture with native Indians characterized by a high incidence of the blood factor. Di^a may not be completely absent in the caucasoid population free from admixture with Indians, since a second example of anti-Di^a was recently found in the serum of a mother of an infant with hæmolytic disease (Levine, P., and Stroup, M., unpublished observations). The specimens, submitted to the Ortho Research Foundation by Witebsky and Rosamilia, were derived from a Polish family living in New York State, and there is no reason to suspect an Indian origin for the blood factor shown to be present in the father's blood and also present in the affected infant's coated red blood cells.

These findings indicate that a factor of extremely low incidence in a general population may have a much higher incidence in other population groups. To a lesser degree this applies also to other blood factors, such as the well-established differences in incidence of type Rh_0 in caucasoids and African negroes. The point at issue here is the usefulness of the term 'low incidence' to characterize certain blood factors. 'Low incidence' is preferable to 'family' or 'private', and the term is still helpful because it characterizes the first observations made with a particular blood factor.

Most significant is the occurrence of a high incidence of matings incompatible for a particular blood factor capable of causing hæmolytic disease in a population which is almost exclusively *Rh*-positive[4]. It can be safely predicted that, in the Caribe Indians or in any population with a high incidence of incompatible matings for Di^a, this factor may play a part in causing hæmolytic disease comparable in importance to the $D(Rh_0)$ factor in caucasoids provided that the two factors have the same degree of antigenicity.

If the genetically related Di^b and anti-Di^b exist, the antibody should be sought among the homozygotes of genotype Di^aDi^a of the Caribe Indians.

The *Diego* Blood Factor in Brazilian Indians

IT has been pointed out[1] that what appears to be a rare, private or family antigen in one population may be fairly frequent in another. For example, the antigen which had sensitized an Amerindian woman so that she lost the child of her ninth pregnancy through erythroblastosis was found in the blood of her husband and of some of her children, but not in the blood of 794 other Amerindians, and it was therefore considered to be rare. However, when tested with the blood of Caucasians, the antibody could be shown just to be anti-*Kell*, the *Kell* factor being quite frequent in the Caucasian sample.

An analogous situation also involving Amerindians and Caucasians is provided by the *Diego* factor recently described by Levine, Koch, McGee and Hill[2]. This factor, discovered to be the cause of an erythroblastosis case in a Venezuelan family, was first considered to be rare because two hundred whites tested in the United States were all negative. However, Layrisse, Arends and Sisco[3], testing 266 people from Caracas and 61 from Barcelona (Venezuela), found 6 (2·3 per cent) and 2 (3·3 per cent), respectively, to be *Diego*-positive, and they ascribed this finding to Indian admixture. Testing two groups of Caribe Indians—121 in Cachama and 49 in Santa Clara of Aribi—they found 43 (35·6 per cent) *Diego*-positives in the first group and 7 (14·3 per cent) in the second. In addition, 8 (5·3 per cent) *Diego*-positives were found among 152 Guajires Indians belonging to the Arawco group.

We had the opportunity of testing two groups of Brazilian Indians with the anti-*Diego* serum using the anti-globulin method. The first group of 48 Kaingángues, living in a reservation near Palmas, State of Parana, included 22 (46 per cent) which gave a positive reaction. The second group consisted of 36 Carajás living at Santa Isabel, Bananal Island, among whom 13 *Diego*-positives (36 per cent) were found. Both groups of Indians belong to the linguistic family of the Ge and live some 1,100 miles apart.

If the *Diego* factor, as at present seems possible, is universally common among Amerindians and absent or mostly absent among whites, it might provide some indication of the degree of Amerindian admixture in many American populations. Studies of its infiltration and of the resulting antigenic incompatibility might also be rewarding.

Thanks are due to Dr. M. Layrisse for a gift of anti-*Diego* serum and to Dr. J. Dausset for its transport.

Absence of Abnormal Hæmoglobins in some Australian Aboriginals

WHEN the sickle cell trait was found to be present in a number of Veddoid communities of southern India[1], it was also found that their rhesus chromosome distribution showed features differing from those of other Indian populations, and that it was more like those found in South-East Asia, Australasia, and especially in the Australian aboriginals. We therefore examined seventy-two Australian aboriginals for the presence of the sickle cell trait, but found that none of them showed this abnormality[2]. Since then, other abnormal hæmoglobins besides the sickle cell hæmoglobin have been discovered. One of them, hæmoglobin *E*, was found in the Veddas of Ceylon[3], and while the presence of sickling was confirmed in those Veddoid populations of India in whom it had been originally described, several other Veddoid populations[4]—including the Veddas themselves[3]—were found to be free from sickling. We decided, therefore, to examine once more Australian aboriginals, this time for the presence of hæmoglobin *E*.

We collected blood from a hundred and sixty-six aboriginals in Queensland; a hundred and forty-eight were of unmixed Australian ancestry according to their own accounts and also to their appearances. Of the others, seventeen had some European, one some Indian, and one some Chinese forbears. The bloods of fifty-five were collected on a visit to the Mona-Mona Mission, of fifty-five from a mission near Daintree, and of fifty-six from one near Yarrabah. The blood was taken under sterile conditions and arrangements were made for speedy transport with cooling on the way, so that the specimens were examined in London less than ten days after they had been obtained in Australia. All bloods were submitted to filter-paper electrophoresis. A barbitone buffer of *p*H 8·6 and of ionic strength 0·05 was used. All hæmoglobins moved as a single band in the position of normal adult hæmoglobin controls. Hence not only did these Australian aboriginals not carry hæmoglobin *E*, but also the presence of all other known abnormal variants of adult hæmoglobin could be excluded as well.

It is still too early to assess the extent to which the distribution of sickle cell hæmoglobin and of malarial infection are related[5]. It would be even more premature to speculate on the correlation of the distribution of malaria with that of other hæmoglobins such as *E*. Nevertheless, it is noteworthy that malaria is thought to be a recent importation into the Australian mainland, and that its aboriginals, unlike most of the older populations of tropical Africa and Asia, do not seem to possess multiple hæmoglobins.

Stability of Iso-alleles

THE high stability of most genes when kept under natural conditions is deduced from the relative rarity of spontaneous mutations which produce striking deviations from normality. The existence of wild-type iso-alleles, that is, of different alleles usually causing the same normal phenotype although distinguishable by their effects under special conditions, raises the question whether mutations from one iso-allele to another are more frequent than mutations with more obvious new effects.

In order to obtain relevant data, males of a wild-type ('Canton-*S*') stock of *Drosophila melanogaster*, which had been made isogenic some time before the experiments, were crossed to homozygous $ci\ ey^R$ females (ci = cubitus interruptus, ey^R = eyeless-Russian; both located in chromosome 4). The resulting $F_1\ ci\ ey^R/+\ +$ individuals were expected to have uninterrupted fourth veins in their wings, since the Canton wild-type allele, $+^C$, is dominant over the ci allele. In case a mutation had occurred, from $+^C$ to an iso-allele of the type of $+^3$ which has reduced dominance[1], the appearance of interruptions on the wings would have been expected, the frequency of this event being dependent on the penetrance of the new '$ci/+^x$' genotype. Similarly, iso-alleles of ci might have been expected which would give vein interruptions in a new genotype '$ci^y/+^C$'.

More than 31,000 F_1 flies were raised, partly at 26° C. and partly at 18° C., the lower temperature providing a more sensitive environment in view of the known increasing penetrance and expressivity of the ci phenotype with decreasing temperature. Most of the F_1 flies had normal venation, but five females and fifteen males had the very weak ci or ci-like phenotype of class 1[2], characterized by localized thinning of the cubital vein (Table 1).

Table 1 F_1 FROM $ci\ ey^R/ci\ ey^R$ × CANTON ♂♂

	Normal		*ci*-like	
Temp.	♀♀	♂♂	♀♀	♂♂
26°	9,745	9,236	2	8
18°	6,669	5,392	3	7

Seventeen of these twenty possibly mutant flies were individually tested in crosses to flies homozygous or heterozygous for $ci\ ey^R$. (The other three individuals left no progeny.) Sixteen of the seventeen flies did not produce any further non-eyeless ci-type offspring. The deviant parents had apparently unchanged $ci\ ey^R/+^C+$ genotypes, and their ci or ci-like phenotype was simply an expression of rare penetrance of ci in $ci/+^C$ heterozygotes. The seventeenth individual, a female, proved to have been heterozygous for a new recessive mutant allele similar to the ci mutant employed in these crosses but with peculiarities in expression of its own, notably frequent interruptions in the inter-crossvein section of the fourth vein. This new ci mutant had arisen from the $+^C$ allele.

There is thus no evidence among some 31,000 tested gametes for mutation from $+^C$ to a recognizable wild-type iso-allele, or from ci to a recognizable mutant iso-allele, in contrast to the finding of a typically deviant ci mutant from $+^C$. It must be added, however, that at the temperatures used, incomplete penetrance could have kept a considerable fraction of wild-type iso-alleles from phenotypic expression.

A priori, no close relation between type of effect and frequency of mutation should exist. The limited experiments reported here agree with this expectation.

Bulinus (Pyrgophysa) forskalii (Ehrenberg) as a Vector of *Schistosoma haematobium*

In a recent communication, McCullough[1] stated that although the snail *Bulinus* (*Pyrgophysa*) *forskalii* was known to be a vector of urinary bilharzia in the Gambia and in Mauritius, there was no direct evidence that it acted in a similar capacity in the Gold Coast; moreover, snails of that species collected in the Gold Coast were wholly resistant to experimental attempts to infect them with the miracidia of the causative organism, *Schistosoma haematobium.*

It seems appropriate to try to throw light on some aspects of this recurrent problem. First, no laboratory infection experiments can ever show beyond doubt that a species of snail is or is not a vector of a certain schistosome. Only by the finding of 'wild' snails shedding cercariæ and the infection of definitive hosts by those cercariæ, with the subsequent recovery and identification of the adult worms, can the role of a mollusc vector be established. Secondly, the apparent difference in receptivity to infection of a snail species in different countries can only be analysed when the identity of the snails is established beyond doubt. McCullough quotes his own work in collaboration with Duke[2] in the Gambia and that of Adams[3] and Cowper[4] in Mauritius to show that *B. forskalii* is a vector in those areas. In the first case, the evidence is largely epidemiological; but in the second, successful infection experiments were carried out. McCullough admits the possibility of separate and distinct species of snails being involved in the Gambia, Mauritius and the Gold Coast; but he maintains that if this is so, the differences between them have not been recognized.

So far as the Gambia is concerned, Smithers (in the press) has shown that the vector identified by McCullough and Duke as *B. forskalii* is in fact a different species which was identified by Mandahl-Barth as *B. senegalensis* Müller. My own observations (Wright, in the press) confirm the conclusion that the vector in the Gambia is a species distinct from *B. forskalii*; but I tentatively identify it with *B. ludovicianus* (Mittre). It is only by further taxonomic work, which is now in progress, that this difference of opinion can be resolved; but there can be no reasonable doubt that the important vector in the Gambia is not *B. forskalii* (which also occurs in that area) but another *Bulinus* which can be differentiated from it on both morphological and ecological grounds.

The evidence of Adams and Cowper from Mauritius rests also on an incorrect identification of the molluscan host. Specimens of Adams's material in the collection of the British Museum have been compared with the type series of *Bulinus cernicus* (Morelet), and there is no doubt that it is to this species that the Mauritian vector should be assigned. Adams states that his snails were identified by Connolly, who used the work of Germain[5], and it is this author who is responsible for the incorrect inclusion of Morelet's species in the synonymy of *B. forskalii.*

Initial Absorption of Ions by Plant Tissue

Recent papers have stressed two aspects of the initial entry of ions into plant cells and tissue, namely, diffusion[1,2] and ion exchange[3,4]. It is important to realize that these processes are merely two aspects of the one system. Since the unity of the experimental facts may not be obvious, it is thought necessary to review some of the evidence, and to attempt to produce agreement amid apparent contradictions.

A proportion, depending on the medium concentration, *p*H, etc., of a piece of plant tissue is penetrated by both ions of a salt, such as potassium chloride, reversibly, in 20–40 min.[1,5]. The time depends on the geometry of the system[2,5]. The proportion of the tissue which appears to reach the external concentration in the initial uptake has been termed the 'apparent free space', a term originally due to G. E. Briggs. This varies from a few to more than 30 per cent[1,2,6]. Since the initial uptake and subsequent 'accumulation' are to a large extent independent, the vacuoles, which occupy a large proportion of the tissue volume, and into which the ions are finally accumulated, are thought not to be part of the apparent free space, which therefore includes intercellular spaces, cell-wall spaces and, very probably, some cytoplasm.

The dependence of the initial uptake and apparent free space on *p*H and concentration[3] of the medium is consistent with a Donnan equilibrium between the medium and a predominantly anionic phase in the tissue. The magnitude of the free space suggests that it includes some, if not all, of the cytoplasm as well as the aqueous phase associated with those cell-wall constituents which are anionic.

The mean concentration A of the Donnan (indiffusible) anions in the free spaces has been estimated[2] to be between $0 \cdot 006 M$ and $0 \cdot 04 M$ in maize and bean roots, depending on the age of the tissue. From measurements of the phase-boundary potential differences, Vervelde[7] estimated the surface of the roots of barley, oats, etc., to have the equivalent of $0 \cdot 02$–$0 \cdot 06 M$ of immobile anions at *p*H 5·5.

At external concentrations C_0 (of a single salt) comparable with or higher than A, the equilibrium concentration of mobile anions and balancing cations (C_i) in the cytoplasm is appreciable: for example, if $A = 0 \cdot 01 M$ and $C_0 = 0 \cdot 01 M$, $C_i = 0 \cdot 0062 M$. In addition to this diffusion of ions of both signs when $C_0 \geqslant A$, external cations will exchange with those initially paired with the immobile anions of the free space. This effect, as can be seen from Fig. 1, becomes increasingly important in comparison with the entry of ion pairs at external concentrations less than A: for example, if $A = 0 \cdot 01 M$ and $C_0 = 0 \cdot 001 M$, $C_i = 0 \cdot 0001 M$. This accounts for the conclusion by Scott Russell and Ayland[4] that diffusion in their experiments was unimportant compared with ion exchange.

In the Donnan system envisaged for the cytoplasm of the free space, cation exchange will depend on the affinity of the immobile anions (proteins and others) and the exchanging cations[4]. The specificity of binding found by Epstein has lately been referred to the ion carriers of accumulation[8] and not to the initial uptake. Exchange between anions adsorbed to cytoplasmic indiffusible cations and anions from the medium is unlikely. At *p*H 7, dissociation of the acidic groups of the surface of the protoplast is complete and cationic groups are unlikely to exist, as shown by electrophoretic studies (McLean, personal

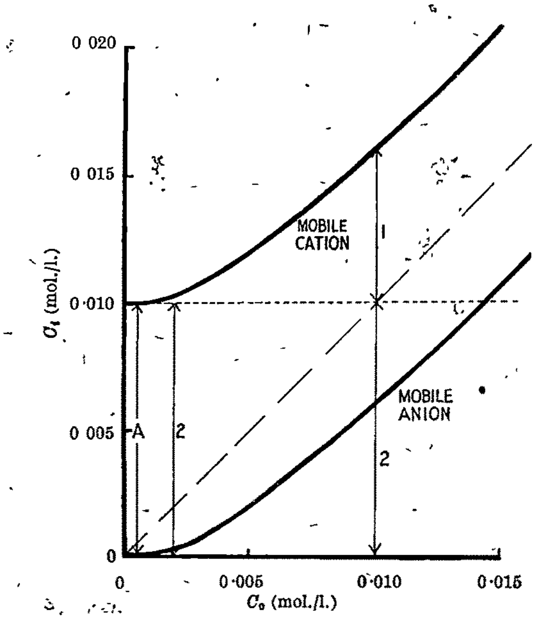

Fig. 1. Concentrations of mobile anions and cations in a Donnan phase with concentration of immobile anions A = 0·01 mol./l. plotted against external concentration C_0. The dotted line represents equality of concentration. The portions 1 and 2 of the total mobile cation concentration are those diffusible and potentially exchangeable respectively

communication). In any event, the initial uptake of anions is much less than that of cations[5], consistent with a Donnan equilibrium.

The time of equilibration in the initial uptake[2], the potential-difference drifts with time when tissue encounters a new concentration[1] and the time to reach a new level of respiration on adding salt are all consistent with the absence of a high-resistance membrane at the cytoplasmic surface. Vervelde[7] also stresses the three-dimensional nature of the equilibrium.

The cation exchange and apparent free space would depend on any metabolic changes in the cytoplasm which influence the concentration of immobile ions A. Butler[6] found that 2,4-dinitrophenol increased the apparent free space of wheat roots for the chloride ion from 24 to 34 per cent. Scott Russell and Ayland[4] found a reduction of cæsium ion uptake (exchange) in the presence of dinitrophenol. Both effects may be consistent with a lowered A.

It is concluded that the hypothesis of a complex Donnan system can account for most of the observations on the initial absorption of ions by plant cells. In addition to this system, a process dependent on respiration must be postulated to explain the subsequent irreversible absorption (accumulation) probably into the vacuoles.

Effect of Streptomycin on *Acetobacter capsulatum* and its Associated Dextran–Dextrinase Enzyme System

In an earlier publication[1], we have reported that *Acetobacter capsulatum* N.C.I.B.4943 failed to grow in a yeast extract - glucose medium containing 1 μgm. per ml. of streptomycin sulphate. More recently, we have found that *A. capsulatum* is sensitive to 1 μgm. per ml. of streptomycin sulphate at *p*H 4·5 and to 0·01 μgm. per ml. at *p*H 6·5 during 48 hr. incubation at 25° in the same medium. The effect of *p*H on antibiotic activity is already well recognized; but the extreme intolerance of *A. capsulatum* to streptomycin would seem to be unusual and worthy of note.

We have previously suggested[1] that this high sensitivity of *A. capsulatum* might be related to the fact that the organism is remarkable in its ability to convert dextrin into dextran[2], and in view of the fact that Barker, Bourne, Stacey and Ward[3] have shown that streptomycin inhibits certain carbohydrate-synthesizing and degrading enzymes, we have examined further the effect of streptomycin on *A. capsulatum* dextran–dextrinase.

Experiments have been based on the observation that there is a linear relation between relative viscosity and concentration of *A. capsulatum* dextran in 0·5 *M* acetate buffer (*p*H 4·6) between 0·0 and 1·0 mgm. per ml. At *p*H 4·6, the addition of streptomycin (1 per cent w/v) had no effect on the synthesis of dextran by the isolated enzyme[2] with a substrate concentration of 1 per cent w/v, the ratio of inhibitor to substrate being comparable to that used by Barker *et al.*[3]. Attempts to detect inhibition of the enzyme system at *p*H 6·2 failed, as no enzyme activity could be detected at this *p*H value in the absence of streptomycin. Since the enzyme is not active at the higher *p*H (the optimum *p*H for growth of *A. capsulatum*), it may be concluded that inhibition of the growth of *A. capsulatum* by streptomycin is not due to disturbance of its dextran–dextrinase enzyme system. Further, we have shown that this enzyme is extracellular, and would therefore not be expected to play a vital part in the development of the organism under normal conditions of growth. On this basis, it would appear that streptomycin affects a more fundamental metabolic process of the organism; further work is in progress.

We are grateful to Dr. T. K. Walker for his continued interest.

Evidence for the Presence of Noradrenaline in Submicroscopic Structures of Adrenergic Axons

The presence of sympathomimetic activity in adrenergic nerve tissue has been demonstrated by several authors[1]. The active substance later was shown to possess the characteristic biological and chemical properties of noradrenaline[2]. A comparison of the relative contents of noradrenaline in splenic nerves (10–20 μgm. per gm.) and the spleen (2–4 μgm.

per gm.) suggests that the transmitter is accumulated in the terminal parts of the nerves. Certain substances, such as acids, detergents and digitonin, which release catechol amines from adrenal medullary cell granules[3], also release the adrenergic transmitter from a perfused organ[4]. Moreover, since the adrenergic nerves may be regarded as homologues of the adrenal medullary cells, it may be expected that their specific action substance is similarly stored.

In order to test this hypothesis, experiments have been undertaken involving catechol analysis of granular fractions of homogenized splenic nerves of the ox and splenic tissue from ox and rat. Noradrenaline was estimated biologically and its identity checked by paper chromatography. Histamine was also determined in some cases.

The nerves were cut into 2–3 mm. pieces and homogenized in 15–50 ml. 0·3 *M* sucrose in a Waring blendor for 1 min. at 40,000 r.p.m. After centrifugation in an angle centrifuge for 6 min. at 800 *g*, the upper part of the homogeneous supernatant, free from visible sediment, was again centrifuged for 60 min. at 6,800 *g* at + 12° C. The small amount of sediment was suspended in 5–7 ml. water to which 0·2 ml. of 0·5 *N* sulphuric acid was added. The results of five experiments are given in Table 1.

Table 1

No.	Total amount of noradrenaline (μgm./gm. nerve)	Per cent of total noradrenaline activity in sediment	Total amount of histamine (μgm /gm. nerve)	Per cent of total histamine activity in sediment
N 1	—	19	—	—
N 2	—	19	—	—
N 3	—	18	—	< 2
N 4	9·1	17	82	< 2
N 5	8·8	15	105	< 2

Of the total activity found in the supernatant after the first separation, 15–19 per cent was present in the sediment after the second centrifugation as seen in Table 1. The sediment contained only very fine granules, less than 1 μ in diameter, but no fibre structures. No granules visible with light microscopy were found in the supernatant after the second centrifugation. The granules of the sediment apparently had a high density, since they were separated and packed well on centrifugation. The noradrenaline content of the small volume of the supernatant present in the sediment accounted for less than 10 per cent of the amount found in the granular sediment. Resuspension and washing the sediment with 0·3 *M* sucrose did not alter the results.

The total noradrenaline figures of the nerve homogenate were determined in two cases and found to be 8·8 and 9·1 μgm./gm., which agrees with previous estimations[2]. Secondary adsorption of noradrenaline on the granular sediment seems unlikely, since sediment obtained in the same way from liver did not take up noradrenaline from a 0·3 *M* sucrose solution.

In two experiments the histamine content of the supernatant and the sediment was also estimated. The total amount in the homogenate was 82 and 105 μgm./gm., in agreement with previous findings[5]. Of this, less than 2 per cent was found in the sediment, which is evidence against histamine being a constituent of the same granular fraction as contains noradrenaline.

In nine experiments the noradrenaline content was determined in the corresponding fractions of ox spleen homogenized by the Potter–Elvehjem method. The homogeneous supernatant was recentrifuged once or twice. The sediment contained 16–44 per cent of the total activity, on an average 32 per cent. Similar results were obtained in five experiments with rat spleen (14–29 per cent, average 23 per cent).

While the experiments reported here have demonstrated the presence of noradrenaline in a readily sedimentable granular fraction from adrenergic nerves, analogous to the form of storage found in the chromaffin cell, detailed statements as to the nature of these particles must await further experiments. Histamine, although present in large amounts in the adrenergic nerves of the ox, is not present in these structures.

Simultaneous Recording of Inspired Oxygen Concentration and Peripheral Tissue Oxygenation

It is often of great convenience in physiological work to secure continuous rather than intermittent records of the variables under investigation. Recently an apparatus was described for analysing continuously the gas mixture presented to infants undergoing treatment in nursery incubators[1], and an extension of this principle has now been used in some animal experiments with the view of examining the response of the organism to changes in oxygen content of its inspired air. By a combination of such records it should be possible to derive an estimate of the minimal change in inspired oxygen which will produce a significant change in the peripheral tissues of the animal or infant.

The method employed for measuring oxygen tension in the tissues is a development of the polarographic techniques introduced by Davies and Brink[2], and afterwards extended by Montgomery and his co-workers at the University of Philadelphia[3]. The electrodes used are a cathode of 0·005 in. diameter platinum wire, insulated except for a length of about 0·5 mm. near the tip with 'Diamel' enamel, and a non-polarizable anode of 0·01 in. diameter silver wire electrolytically coated with silver chloride[4]. (When suitably applied, 'Diamel' enamel gives a tough yet flexible high-resistance insulating coating to the wire.) These electrodes were inserted through truncated hypodermic needles for a distance of about 2 mm. through the skin of a rabbit's back. The points of insertion were coated with collodion, and the area covered with transparent plastic tape. The rabbit, anæsthetized with 'Nembutal', was placed

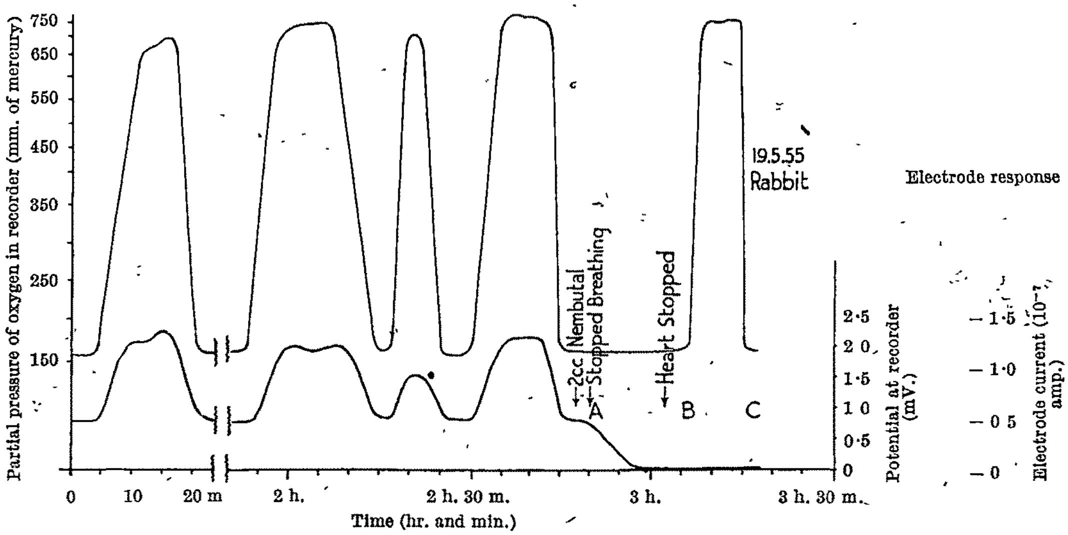

Fig. 1. Upper curve: oxygen partial pressure in the chamber: recorded by the magnetic oxygen meter. Lower curve. simultaneously recorded subcutaneous oxygen-electrode currents

in a closed chamber into which varying mixtures of oxygen and air could be admitted from gas cylinders. The oxygen content of the gas in the respiration chamber was recorded by means of a magnetic instrument, based on that of Naumann[5] but designed to record continuously from zero to 100 per cent oxygen concentration at or near atmospheric pressure (Kay, R. H., and Hobson, A., unpublished). Simultaneously, the polarographic current passing between the electrodes when an e.m.f. of 0·6 V. was maintained across them was amplified and recorded. The final display was an Elliott six-channel potentiometer recorder, inspired-oxygen concentration being fed to the even-numbered channels, polarographic electrode currents to the odd. Fig. 1 shows a record obtained in a typical experiment.

It was necessary to be sure that the oxygen tension registered by the electrodes was determined by the circulation and not by diffusion across the skin of the rabbit. This is shown by the last portion of the curves in Fig. 1 where, on abolishing the rabbit's respiration by a large additional dose of barbiturate, it was possible to observe a fall in electrode current to zero when the rabbit was exposed to air (*A*), while a subsequent exposure to pure oxygen produced no rise in the tissue tension (*BC*).

To summarize briefly the results of these preliminary experiments, which were carried out at room temperature: (1) when the oxygen content of the inspired gas is varied cyclically between 21 per cent and 100 per cent (as in Fig. 1), the recorded tissue electrode current begins to rise or fall within one minute of the beginning of the rise or fall of concentration of the inspired oxygen. (2) The initial rate of change of both tissue-electrode current and concentration of inspired oxygen are usually closely similar, provided the latter does not change more rapidly than 1 min. to half-total change. (3) There is evidence that a rapid reduction (from 100 per cent) of inspired oxygen concentration is more quickly reflected in the tissue response than is a similarly rapid increase (from 21 per cent) of concentration of inspired oxygen.

The amplitude of the tissue-current response, corresponding to the five-to-one change in concentration of inspired oxygen, is usually of the order of three to one. This order of magnitude corresponds well with intermittent tissue-tension measurements by subcutaneous gas depots in animals[6].

Although it is extremely difficult to calibrate the electrode current in terms of absolute oxygen tension in the tissues (this is easy *in vitro*), nevertheless there is good reason for supposing that the changes recorded reflect the ratio of oxygen tensions under different conditions quantitatively.

Similar records have been obtained from monkeys with electrodes in the back and scalp, and it is proposed to use this technique on human subjects in order to study their response to inhaled oxygen. The method is now repeatable and safe. Detailed results will be published later.

We thank Johnson Matthey and Co., Ltd., for advice and assistance on the enamelling of platinum wire.

Autoradiographic Localization and Measurement of Intracellular Antibody, using Labelled Antigen

Following on work in which much indirect evidence implicated the plasma-cell as the site of antibody production[1], microscopic demonstration of antibody in plasma-cells was effected by a fluorescein-conjugate technique[2]. However, this method is limited to some extent by the difficulty in studying the morphology of antibody-containing cells, by the possibility of non-specific staining and by its inability to yield quantitative results. Further, since

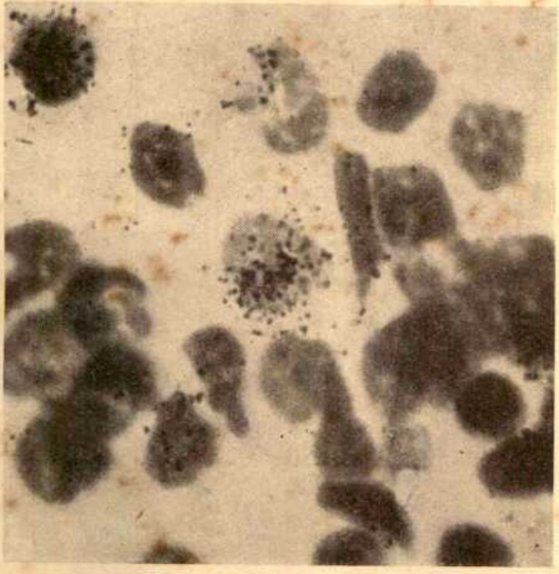

Fig. 1. Imprint of spleen showing fixation of labelled polysaccharide by certain cells. Kodak autoradiographic stripping film. Exposure 40 days. Stained with Leishman–Giemsa

this technique renders both antibody and antigen in tissues fluorescent, it would be difficult to exclude the presence of a small amount of antibody in the neighbourhood of persisting injected antigen.

In the present investigation, rabbits were immunized with a formalin-killed culture of a *Klebsiella*. Touch-preparations of spleen and lung on slides were fixed in 95 per cent ethanol at 37° C. for 30 min. The same organism was grown in a synthetic medium with sodium acetate - 1 - ^{14}C as the sole source of carbon. The polysaccharides were extracted[3] and had a specific activity of about 1 μc. per mgm. (kindly determined by Dr. A. S. McFarlane).

The touch-preparations were covered with labelled polysaccharide (0·1 mgm./ml. in saline) for 1–2 hr. at room temperature, and uncombined material washed off. Autoradiographs were made, with exposures of 30–40 days, and the preparations stained[4].

Radioactivity due to fixation of polysaccharide showed the presence of antibody in a proportion of cells. No evidence of radioactivity was seen over the many reticulo-endothelial cells present.

The number of silver grains over individual cells was counted and, since the specific activity of the polysaccharide was known, this enabled the amount of polysaccharide deposited per cell to be estimated.

From a sample of the serum of one rabbit, 1 mgm. of polysaccharide precipitated 4·2 mgm. of antibody. When the serum was dried, fixed in ethanol and re-dried in the same way as were the tissue preparations, the antibody suffered an eight-fold reduction in combining power. Accordingly, the amount of antibody per cell was calculated by multiplying the amount of polysaccharide deposited by 4·2 × 8. The result varied from 5 to 50 μgm. per cell. This would correspond to about 3–33 per cent of the protein of a cell of 1,000 μ^3 volume.

Although, owing to initially inadequate touch-preparation technique, the morphology of the antibody-containing cells is not clear, this method offers the possibility of correlating antibody content with cell morphology and with the level of circulating antibody. The production, storage and release of antibody may thus be studied quantitatively, and on a cytological level. The method may also be applied to the study of allergic states.

I am indebted to Dr. H. Loewenthal for continued interest and for the provision of facilities.

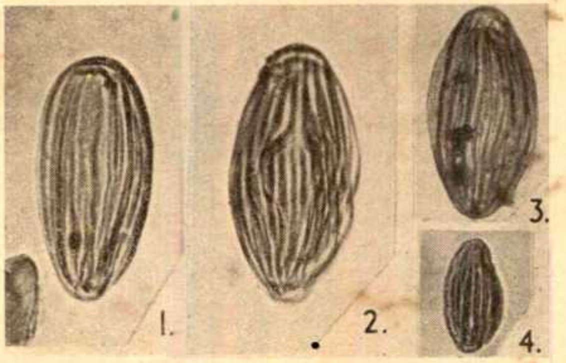
Pollen Grains of the *Ephedra* Type in Australian Tertiary Deposits

POLLEN grains with the same shape, approximate size-range and exine characters as those of *Ephedra* and *Welwitschia* have been found recently in certain Lower Tertiary deposits in south-eastern Australia. The pollen grains of *Ephedra* and *Welwitschia*[1] are characterized by the more or less prominent longitudinal ridges into which the exine is raised, and the structureless nature of the exine itself; but, whereas those of *Welwitschia* have a distinct germinal furrow, the pollen grains of most species of *Ephedra* have no furrow. The absence of a furrow from the Australian fossil pollen grains in question suggests that they are more closely related to *Ephedra* than to *Welwitschia*.

In the southern hemisphere the living species of *Ephedra* are restricted to South America, where they are most abundant in the Andes region of Bolivia and Paraguay; they also extend southward to Chile and Patagonia. The occurrence of pollen grains of the *Ephedra* type in Australian Lower Tertiary deposits, therefore, indicates that *Ephedra* was more widely distributed in the southern hemisphere during early Tertiary times than it is at present.

Fossil pollen grains of the *Ephedra* type have been recorded from: Post-glacial deposits and other sediments in Tierra del Fuego and Patagonia[2]; the Eocene Green River oil shales, United States[3]; Paleocene deposits in the Province of Hanover[4];



(1) Acetolysed pollen grain of *Ephedra nana*. × c. 600. (2)–(4). Pollen grains of the *Ephedra* type from Australian Tertiary sediments. × c. 600

Cretaceous deposits in Iraq, Nigeria and Venezuela[5]; and an Upper Eocene deposit in the United States[5].

The Australian pollen grains of the *Ephedra* type have been found in sediments situated near Launceston, Tasmania, near Nelson, Victoria, and near Lake Frome, South Australia, that range in age from Paleocene to Eocene. Their occurrence in these sediments is extremely sparse.

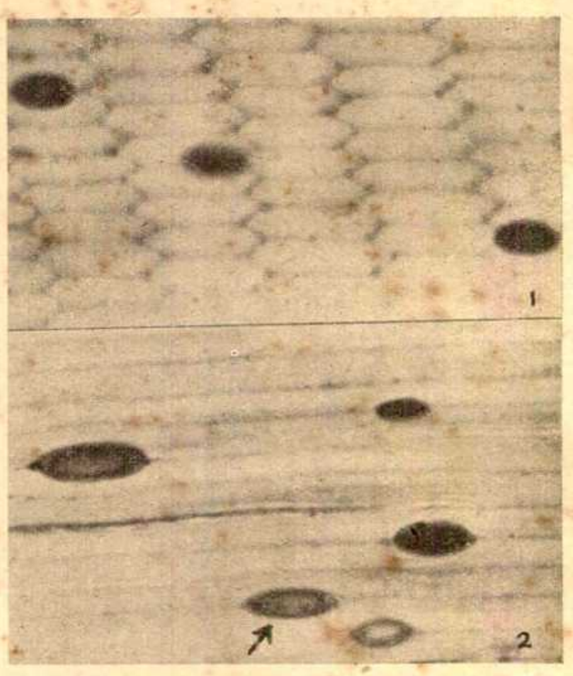
Lipide (Sudan Black Positive) Corpuscles in the Bovine Lens

DURING the course of histochemical investigations on lipides in the adult bovine lens, I observed certain sudanophilic corpuscles which do not appear to have been previously described. These bodies were discovered because of their intense staining with sudan black *B* (and also with its acetylated derivative[1]), which was applied to frozen sections of thin lens slices that had been fixed in calcium chloride formol immediately after death. They are to be found in a restricted zone (1 mm. or so wide in the radial direction) which lies 2–3 mm. from the lens equator and extends a few millimetres on either side of the equatorial plane.

The bodies were present in all twenty bovine lenses examined; they lie between the lens fibres and are seemingly embedded in the cement substance, which also stains with sudan black. In equatorial sections they are found along the broad sides of the unequal hexagons which are characteristic for cross-sections of the lens fibres in this zone (Fig. 1). These corpuscles possess an ovoid form which is elongated in a direction concentric with the lens nucleus, as can be deduced by comparing their appearances in equatorial and meridional sections (Figs. 1 and 2). They vary considerably in size, with a length ranging from 2 to 15μ; but the larger forms are more frequent. Prolonged staining with sudan black *B* causes many of them to become intensely, almost homogeneously, blackened. When only lightly stained (for example, for 5 min. in a saturated solution of sudan black in 70 per cent alcohol at room temperature) a dense outer rim and a paler central core can be discerned in these structures. When sections of the lenses were cut parallel to the plane of an equatorial tangent, many of the corpuscles were seen to contain a fine, often crenated, filament forming an incomplete circle in the peripheral zone. This filament is only occasionally evident in meridional (Fig. 2) and equatorial sections. Sometimes, minute, strongly sudanophilic granules are present in the interior of the corpuscle (Fig. 2).

Once these corpuscles had been located with sudan black, it was then possible to submit them to other histochemical and tinctorial tests. Other fat stains, such as sudan IV and Fettrot 7*B*, coloured these objects in pale shades of orange. The usual chromatin stains, including the Feulgen reaction, were negative. After applying the periodic acid – Schiff routine the corpuscles were faintly positive; the performic acid – Schiff technique and direct Schiff reaction were both negative.



Frozen sections of the bovine lens. Fixation in calcium chloride formol. Stained with sudan black *B*. Both × 1,500.

Fig. 1. An equatorial section illustrating sudanophilic corpuscles and their relationship to the broad sides of adjacent lens 'hexagons'. The cement substance, in which the corpuscles appear to be embedded, is also sudanophilic.

Fig. 2. A meridional section. The relationship of corpuscles to the cement material and to the lens fibres is again evident. Several corpuscles exhibit a dense rim and paler core. One corpuscle (indicated by arrow) shows the coiled filament and minute granules described in the text

The nature and significance of these corpuscles remains, at present, obscure. One is struck by the resemblance which they bear to nuclei; this resemblance, however, is superficial, for their morphology, tinctorial and histochemical properties, together with their location between the fibres and their situation in a zone lying some distance from that of the true nuclei, all point very strongly against a nuclear relationship.

In view of the notorious ease with which artefacts can occur in microscopic sections of the lens, an attempt was made to eliminate this possibility. Fresh frozen sections of material preserved by freezing (– 80° C.) immediately after death were examined with the phase-contrast microscope; the corpuscles were well seen and their relationship to the cement material again confirmed. Examination with the polarizing microscope did not reveal birefringence.

Similar corpuscles were also observed in lenses from the cat and the dog. As I have been unable to find any previous reference to these structures, I should be most grateful for comments or additional information.

Thursday, January 12

British Psychological Society, Industrial Section (in Room 424, Birkbeck College, Malet Street, London, W C.1), at 1 p.m.—Mr. A. Crawford: "The Study of the British Road User".

Physical Society, Low Temperature Group (in the Lecture Theatre of the Royal School of Mines, Prince Consort Road, London, S.W.7), at 3 30 p.m —Dr. H. M. Rosenberg: "The Fatigue of Metals at Low Temperatures".

Aslib (joint meeting with the Scientific Film Association, at the Royal Society of Arts, 8 John Adam Street, Adelphi, London, W.C.2), at 6 p.m.—Sir Arthur Elton. "The Documentation of History by Film".

Royal Aeronautical Society (at the Royal Institution, Albemarle Street, London, W.1), at 6 p.m.—Mr. N. E. Rowe: Presidential Address

Society of Instrument Technology (at Manson House, 26 Portland Place, London, W.1), at 7 p.m.—Mr. B. W. Balls: "Liquid Flow Control".

Friday, January 13

Royal Astronomical Society (at Burlington House, Piccadilly, London, W.1), at 4.15 p.m —Geophysical Discussion—"Irregular Changes in the Rotation of the Earth". Chairman: Sir Harold Spencer Jones, F.R.S. Speakers: Mr. T. Gold, Dr. W H. Munk and Prof. S. K. Runcorn.

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Principal Scientific Officer (with at least a second-class honours degree in metallurgy or physics or equivalent qualifications, and a sound knowledge of theoretical physical metallurgy) with the Industrial Group of the U.K.A.E.A., Research and Development Branch, Windscale, Sellafield, Cumberland, to lead a team engaged on the study of materials of interest associated with nuclear reactors—The Recruitment Officer, United Kingdom Atomic Energy Authority, Industrial Group Headquarters, Risley, near Warrington, quoting Ref. 1215 (January 10).

Mathematician/Statistician (with an honours degree in mathematics or statistics and some experience in the analysis of experimental data) in the Scientific Department at London H Q., for duties which include providing advice on scientific problems, design of experiments and analysis of experimental data obtained by scientists in the coalfields and involve some travelling—National Coal Board, Staff Department (Personnel), Hobart House, Grosvenor Place, London, S.W.1, quoting SS/160 (January 12).

Assistant Lecturer (with an honours degree in agricultural botany or botany, and preferably some teaching experience) in Agricultural Botany—The Secretary, Edinburgh and East of Scotland College of Agriculture, 13 George Square, Edinburgh 8 (January 14).

Chemist (under 35, with a degree or equivalent qualification in chemistry, and preferably with training in physics or geology) in the Department of Research and Specialist Services, Federal Ministry of Agriculture, Federation of Rhodesia and Nyasaland, for duties which include routine and research work on soil fertility and on all related agricultural products and problems, and may necessitate periods of up to six months in the field on soil surveys—The Secretary, Rhodesia House, 429 Strand, London, W.C.2 (January 14).

Hospital Physicist (with a first- or second-class honours degree in physics and at least five years experience in the medical field, including radiotherapy), to take charge of a laboratory engaged in experimental and routine work for the medical staff—The House Governor, King's College Hospital, London, S.E.5 (January 14).

Assistant (with a degree in electrical engineering and preferably some research or industrial experience) in the Department of Engineering—The Secretary, The University, Edinburgh (January 15).

Lecturer, Grade II (graduate in mining with underground experience, and preferably with research experience) in Coal Mining—The Registrar, The University, Edgbaston, Birmingham 15 (January 16).

Physical Chemists (with a good honours degree) for work covering fundamental and applied research on coal (Ref. SS/140); and Scientific Technical Officers (with experience in physical or analytical chemistry) (Ref. SS/141)—The National Coal Board, Coal Research Establishment, Stoke Orchard, near Cheltenham, Glos, quoting appropriate SS Ref. No. (January 17).

Research Assistant (with a university honours degree, or equivalent, in botany) at the Department of Agriculture Cereal Station, Ballinacurra, Midleton, Co. Cork—The Secretary, Civil Service Commission, 45 Upper O'Connell Street, Dublin (January 17).

Chemist (with a good honours degree or equivalent) in the National Coal Board's Coal Survey Laboratory, Edinburgh, for analytical investigational work—The National Coal Board, Staff Department (Personnel), Hobart House, Grosvenor Place, London, S W.1, quoting SS/148 (January 21).

Lecturer or Senior Lecturer in the Department of Electronic Engineering, and a Lecturer in the Department of Electric Power Engineering—The Registrar, The University, Liverpool (January 21).

Lecturers/Senior Lecturers (2) in Geology at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, January 21).

Lecturer (first-class honours graduate in mathematics, and preferably with a special interest in some branch of applied mathematics or in statistics) in Mathematics—The Registrar, College of Technology, Manchester 1 (January 23).

Assistant Lecturer (with an honours degree in agriculture or a pass degree in agriculture with a postgraduate diploma, or equivalent qualifications) in Agriculture—The Registrar, The University Reading (January 28).

Johns-Manville Senior Fellow in the Chemistry Department, to assist in research on autoclaved Portland cement—The Secretary, Marischal College, University of Aberdeen (January 31).

Lecturer or Senior Lecturer in Inorganic Chemistry at the University of Tasmania and Hobart Technical College—The Agent General for Tasmania, 457 Strand, London, W.C.2, or The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Hobart, January 31).

Research Officer (recent graduate) with the Australian Leather Research Association, Lane Cove, near Sydney, New South Wales, Australia, for duties which will involve the study by chemical and physical means of the properties of tannins, other than wattle, in Australian native flora, or in exotics cultivated in Australia (principally *Pinus radiata*) with various eucalypts and mangroves as the subjects of subsidiary investigations—The Director, Australian Leather Research Association, c/o Mr. W. Ives, Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W.C 2 (January 31).

I.C I. Research Fellows in Biochemistry, Chemistry, Engineering, Pharmacology Physics or Chemical Technology—The Secretary, The University, Edinburgh (February 13).

Regius Professor of Geology and Mineralogy in the University of Edinburgh—The Private Secretary, St. Andrew's House, Edinburgh 1 (February 18).

Abstractor (with a degree, higher national certificate or equivalent, and a knowledge of languages, particularly German)—The Assistant

Secretary, Ref. B 67, British Coal Utilization Research Association, Randalls Road, Leatherhead.

ASSISTANT LECTURER, Grade B (graduate of a British university) **IN INORGANIC CHEMISTRY**—The Clerk to the Governing Body, Battersea Polytechnic, London, S.W.11.

ELECTRICAL ENGINEER (with a first- or second-class honours degree or equivalent in electrical engineering) at the Royal Aircraft Establishment, Farnborough, Hants, to work on research in and development of radio and other fuzing techniques for guided weapons and bombs—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting D.580/5A/TA.

ENGINEERS and **PHYSICISTS** (particularly with electronics), Senior Scientific Officer and Scientific Officer grade (with an appropriate first- or second-class honours degree or equivalent high professional attainments) in Royal Naval Scientific Service Experimental Establishments, chiefly in the Weymouth and Portsmouth areas and home counties—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting A.344/5A.

ENGINEERS, MATHEMATICIANS and **PHYSICISTS** (with a first- or second-class honours degree or equivalent qualification) at the National Gas Turbine Establishment, near Farnborough, Hants—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting C.661/5A/AA.

PROFESSOR OF CHEMICAL ENGINEERING—The Head, Department of Chemistry, University of Saskatchewan, Saskatoon, Sask., Canada.

SCIENTIFIC OFFICER, PHYSICIST (with a first- or second-class honours degree in physics or mechanical engineering), to assist in a group studying the effects of vibrations and impulse stresses on weapon assemblies—The Senior Recruitment Officer, Atomic Weapons Research Establishment, Aldermaston, Berks, quoting A.703/34.

SCIENTIFIC OFFICER (with an honours degree, preferably in engineering) for dairy engineering research, initially in connexion with machine milking—The Secretary, National Institute for Research in Dairying, Shinfield, Reading, quoting 55/26.

SENIOR BIOCHEMIST (with experience in clinical chemistry or hormone assay), and a **BIOCHEMICAL ASSISTANT** (with some research experience) to work in a Clinical Research Laboratory—The House Governor, Royal Marsden Hospital, Fulham Road, London, S.W.3.

SENIOR PHYSICS MASTER—The Headmaster, School House, Cranbrook, Kent.

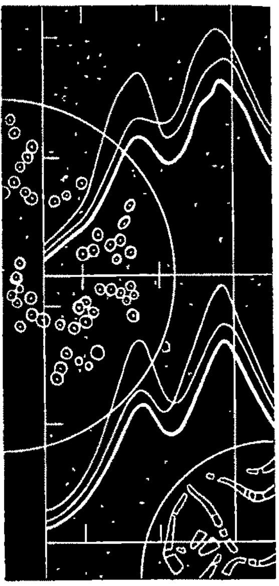
BOOKS ON SPECIALIZED SUBJECTS

Books on science, research, electronics, industrial work, electrical and mechanical engineering can be quickly supplied through your local Smith's shop or bookstall. College and works librarians and students, particularly, are invited to ask for lists of books on any subject. Any books not stocked locally will be quickly obtained from Head Office.



Your stationery and printed matter can also be supplied through our local branch.

SCIENCE, TECHNOLOGY AND MAN-POWER

THE report entitled "Notes on Science in U.S.A., 1954" recently issued by the British Commonwealth Scientific Organization, North America (see p. 76 of this issue), emphasized the continued preoccupation of the United States with problems of man-power and its increasing awareness of the challenge of the U.S.S.R. in this field. There is no doubt that Americans have been surprised by Soviet achievements, and this alone may result in an increased emphasis on the importance of fundamental science to the United States. More recently, Mr. Lewis Strauss, chairman of the Atomic Energy Commission, has expressed the opinion that the United States is rapidly falling behind the Soviet Union in training engineers and scientists, and that in ten years it might be hopelessly outstripped. The United States, he said, is turning out less than half the number of scientists and engineers it requires, and while there are about a million trained scientists and engineers in the Soviet Union and in the United States, only about 35 per cent of those in the United States are working at their profession. Last year the United States had about 23,000 science and engineering graduates compared with the Soviet Union's 53,000, and between 1950 and 1960 the Soviet Union was expected to produce 1,200,000 trained engineers and scientists compared with the United States 900,000. Moreover, 250,000–400,000 high-school students in the United States are being taught mathematics and science by teachers not trained to teach these subjects.

Such comparisons must be accepted with reserve and taken as indicating no more than trends, for the supply of professional personnel, and to a great extent its qualitative characteristics, depend upon the ability of an educational system to adjust itself to the changing needs of a society and upon the ability of that system to train a sufficient number of persons for a variety of specialized tasks. They depend, accordingly, both upon the nature of the educational system and upon the nature of the society which it serves. These must both be considered in attempting any comparisons of this kind, and even as between Great Britain and the United States figures can be very misleading if allowance is not made for such qualitative differences.

The difficulty is particularly acute in comparisons with Soviet Russia, and this is brought out well in the scholarly study of the availability and growth of the specialized man-power resources of the U.S.S.R. carried out by Mr. Nicholas De Witt under the auspices of the National Academy of Sciences—National Research Council, with the support of the National Science Foundation*. Mr. De Witt examines the evidence provided by the Soviet educational effort during the past twenty-five years which, because the type of training given aims definitely at preparing a specialist in a narrow field of professional activity, thus diminishing the opportunities of changing his professional occupation, is more useful for the purpose than the census enumeration or statistics of the employment of specialists. The Soviet policy of placing graduates in jobs coinciding with their field of formal training and their occupational specialities, and various totalitarian control measures, act in the same way.

Despite the pitfalls to which he directs attention, Mr. De Witt believes that it is possible to gain a fairly accurate idea of the general position in the Soviet Union; and apart from this his several chapters give clear and concise accounts of the general setting of the Soviet educational system—of primary and secondary education and of secondary semi-professional training—before he deals specifically with higher education and professional training, with research training programmes and advanced degrees and, finally, presents his conclusions on the supply and quality of Soviet professional and specialized man-power. It is these latter chapters that are of most interest to the scientist and technologist, and they are relevant to the current discussion on the expansion of technological education in Britain and the problems that are indicated in the report on the recruitment of scientists and engineers by the engineering industry which the Advisory Council on Scientific Policy has now released*. The earlier chapters, nevertheless, should not be overlooked. They bring out the major premises on which Soviet educational philosophy rests: the reliance on the central planning of education and research to advance science and technology; the belief that scientific and educational effort are primarily to be directed to the advancement of the national interests; and the static view of human life, of nature and of the universe, which leaves the teacher and the scholar with no further task than to demonstrate and apply established truth.

These premises go far to determine the strength or weakness of the Soviet man-power situation, and Mr. De Witt finds that in fact the expansion of professional training in higher educational establishments is not new and is unlikely in the future to be handicapped by a lack of satisfactory candidates from the secondary schools. Indeed, he expects a better and wider selection of candidates to be available in future; complaints, comparable with those voiced by some engineering firms in Britain, are already being made that school leavers are being directed to higher educational establishments when they should be directed to become skilled workers or craftsmen. It appears that there is a particular shortage of what would be termed in Britain technicians, and that a determined effort is being made to increase the numbers of such men.

---

* Soviet Professional Manpower: Its Education, Training, and Supply. By Nicholas De Witt. Pp. xxviii+400. (Washington, D.C.: National Science Foundation, 1955. Copies obtainable from U.S. Government Printing Office.) 1.25 dollars.

* Office of the Lord President of the Council. Advisory Council on Scientific Policy: Committee on Scientific Manpower. Report on the Recruitment of Scientists and Engineers by the Engineering Industry. Pp. 31. (London: H.M. Stationery Office, 1955.) 1*s*. 3*d*. net.

Mr. De Witt gives a fairly full general account of the thirty-three Soviet universities, which together have only accounted over the past twenty-five years for 8–12 per cent of the output of higher education graduates, most of whom come from the 758 institutes that give no general education and teach enough theory to permit the acquisition of applied knowledge in a given field. Thus they differ sharply from the basis on which even technical education is organized in Britain; but De Witt thinks it probable that in the universities the undergraduate chemist, for example, probably receives a training comparable with, but more extensive than, that in American universities, although there may be reservations on the teaching of selected topics. About half the Soviet students graduate with a major in the humanities and social sciences, and the other half with a science major. Moreover, there seems to be some correlation between academic performance and the positions to which graduates are assigned—the best going to research and those only average into school teaching.

Advanced degrees in the U.S.S.R. are obtained in research institutes as well as in regular higher educational establishments, and up to 70 per cent of them are obtained in scientific fields; while, even more than in the United States, those who acquire such degrees tend to remain in the academic field. Nevertheless, the ratio of professional technical workers in industry to production workers appears to have increased over the past twenty-five years by more than fourfold; and a substantial number of engineers are employed in administrative or managerial positions. Mr. De Witt suggests that in recent years the total number of trained engineers and the ratio of engineers to production workers in industry in the Soviet Union has been about the same as in the United States or even slightly higher. Likewise, the 160,000 scientists estimated as in the U.S.S.R. in 1952 is about four times as great as in 1930, and of these more than a third held advanced degrees.

When all allowance is made for the many reservations which Mr. De Witt emphasizes, he believes that higher education is more accessible in the United States than in the U.S.S.R., and for 1953 he gives the number of those with completed higher education as 5·8 million and 2 million, respectively. In engineering, medicine, agriculture and like fields, however, the U.S.S.R. had as many as, or even more trained men than, the United States: for example, about 500,000 professional engineers compared with 530,000 in the United States; about 280,000 physicians (but only 20,000 dentists) compared with 195,000 (and 90,000 dentists); and 170,000 agriculturists compared with 150,000. In proportion to the population, the number of trained professional men is lower in the U.S.S.R. than in the United States, but higher in relation to the workers not engaged in agriculture. Moreover, of the two million teachers, only about 37 per cent had completed higher educational courses, compared with 70 per cent of the 1·4 million teachers in the United States; and in 1952 there were only 90,000 teachers in higher educational establishments compared with 210,000 (in 1953) in the United States.

Figures such as these need to be kept in mind in comparing the man-power situation in the Soviet Union with that elsewhere, and its orientation primarily to the training of specialists in engineering, agriculture and medicine, and in considering the rather alarmist picture which Lord Simon of Wythenshawe presented recently in his annual report to the Court of the University of Manchester. At present, Lord Simon said, Britain is turning out only roughly half as many scientists and technologists per thousand of population as the other great powers, or roughly a fifth of the number produced by America and an eighth of the number produced by the U.S.S.R. Those figures do not agree with Mr. De Witt's; but much more important than any such comparison is a sound estimate of Britain's own man-power requirements and her available resources to meet them. We need some reasonable estimate of the country's needs for scientists and technologists of particular kinds, and of the supporting technicians. It is only on that basis that we can wisely begin to plan both how to provide the necessary supply, and also the measures to ensure that effective use is made of what at best is always a limited resource and unlikely ever to be in excess of demand.

There is even yet very little accurate information as to Britain's real needs, which may well differ from the apparent demand. Last spring, Sir Harold Hartley estimated the number of research scientists in Britain as about 58,600, a figure which may be compared with a total of 90,000 scientists which the increased output of 5,000 qualified scientists a year recommended by the Barlow Committee in 1946 was expected to achieve by 1955. The report which has just come from the Committee on Scientific Manpower of the Advisory Council on Scientific Policy covers only the engineering industry, and it indicates rather the difficulties with which the problem bristles. Statistically, it examines the recruitment of scientists and engineers by some fifty engineering firms, the average annual intake of which during 1951–53 was 7,156. Of these, 935 possessed first degrees (mainly technologists), 39 higher degrees and 70 first degrees in other subjects. Since university first degrees in engineering awarded to internal students averaged 2,300 over the period, and the nationalized industries took 203, while a considerable proportion found employment in the Civil Service, local government, teaching and the Atomic Energy Authority (some firms complained of intense competition from the Civil Service and the Atomic Energy Authority), the inquiry covered some 50 per cent of industry's intake of engineering graduates from the universities, and the total recruited was 25 per cent below the number required.

The Committee recognizes that this figure may be misleading and may even be an under-estimate, as the demand for such men is rising with the general level of industrial activity. Sir Ben Lockspeiser, for example, has strongly emphasized the need in Britain for greater numbers of research scientists, technologists and technicians, and for the infusion of management with a strong element of technological experience, particularly in relation to fully automatic production engineering, the fruits of which will not otherwise mature. Many firms, moreover, remarked that too few of the graduates possessed real qualities of leadership and suggested that more attention should be paid to general education and the development of character. Most of the firms which co-operated in the inquiry stressed the importance of quality. It was also contended that engineering is not attracting its fair share of the available talent, and there was overwhelming support for recruitment at the first-degree stage except for research posts.

The University Grants Committee has already expressed concern at the conflict between the immediate need of industry for technologists and the claims of postgraduate work, and the Committee on Scientific Manpower quotes a passage from a note from the University Grants Committee to certain universities regarding special recurrent grants for higher technological education during 1954–57, which asks for a broad view of the national interest to be taken in planning postgraduate developments. For this reason, the plans for the expansion of the Imperial College of Science and Technology recently outlined by Dr. R. P. Linstead will be examined with special interest. The University Grants Committee does not consider it opportune to make any further suggestions about the development of technology.

That position, however, is only reasonable on the understanding that in the meantime the opportunity is taken to acquire, as a matter of urgency, much fuller and more accurate information about the requirements of Great Britain for trained man-power and its present distribution, and that plans are prepared, at least tentatively, to deal with the impending increase of some 50 per cent in the potential number of university students. By September 1956, when the universities have decided on their development plans for the quinquennium 1957–62, that increase will be hard upon us. Sir James Mountford estimates that by 1963–64 university numbers could be increased by 50 per cent without affecting quality if we can provide places and funds.

It is indeed reasonable that we should consider the shape and detail of further development in the light of the achievements of the past three years of the present quinquennium; but we should also at least be considering at this stage whether the national interest would not suggest that the universities should raise their standards and also that a large proportion of this impending 'bulge' should go to the technical colleges and not to the universities. Further, it must be remembered that, as Sir James Mountford points out, even the present expansion of British universities lags far behind what was planned for the seven years 1947–54 in terms of new building. Within that period expenditure of some £56 million on new building was approved. While costs have risen steeply, only £22·5 million was actually expended. As against the £80 million that the University Grants Committee stated in July 1946 would be required for new sites, buildings and equipment during the decade 1947–56, up to the end of July 1952 Sir James estimates that, in terms of 1947 prices, no more than £10 million had been completed.

This gives force to his contention that the expenditure of £40 million on university building in Britain during the next five or six years would give double the return to the nation of twice that sum later. The fear that the expansion of higher technological education might be detrimental to the interests of certain sections of the engineering industry noted in the report on recruitment by that industry did not impress the Committee which prepared the report; but it points to the need for some closer inquiry as to the balance to be struck between technical and technological education. Industry requires recruits from both sources—good graduates as well as good apprentices—and there is substance to-day in the argument that, under present social and taxation conditions, industry may draw in as apprentices boys of leadership and ability from middle-class homes with a long tradition of responsibility who formerly would have entered the university.

None the less, there is undoubtedly an increasing tendency for the ablest boys and girls to go to the universities, and the chances of recruiting outstanding talent except from such sources are diminished by the whole trend of educational and taxation policy. There is this to be said, moreover, for expediting as a matter of urgency the plans for new university building set in train nearly ten years ago: their execution, apart from permitting in due course a temporary increase of perhaps 30 per cent in the number of students of science and technology, as the bulge passes from the secondary schools, could be used to effect a permanent rise in standards, through the additional laboratory and library facilities and the increase in number of teachers. If a determined attempt is made to ascertain the real national needs, plans already in being should provide much of the flexibility needed to meet those needs without any considerable modification or further expansion.

The essential conditions are not indeed in conflict provided, as the Committee suggests, the universities and industry consult, and industry both makes its needs known precisely and co-operates in meeting them. The universities must examine their undergraduate courses in engineering, technology and science, and ensure that they are not too narrow and specialized or too cramping to men and women of initiative and of wide and original interest. But the supply of good recruits for apprenticeship courses requires more attention than the Advisory Council on Scientific Policy or its Manpower Committee suggests, and in particular the position of the technical colleges may well be a key. If Britain is to solve her problems of scientific and technical manpower, she must make the best use of her resources in that respect. To do so means giving both the average and the brilliant student the type of education from which they can best profit; and perhaps it is not so much a large expansion in university and technological education, especially at the postgraduate level, that is needed, as a great increase in the number of students of average ability who proceed to the technical colleges instead of, as at present, to the university. Nor is this view inconsistent with Sir Alexander Todd's suggestion that industry needs many more men with a good general science degree.

In this connexion, it is worth noting that Sir Eric Ashby has suggested that technology may hold the key to general culture. Unlike science, it involves an understanding of popular art and of commerce and psychology, something of morals and justice and some skill in the art of communication. It is the spirit of pursuit that matters, and we would be wise to explore such possibilities carefully. Further, there may be more substance in the criticism that the engineering research carried out at the universities is concerned with topics of little value to industry than the Committee on Scientific Manpower seems disposed to admit. All such matters are best discussed in the light of a review of the distribution of Great Britain's scientific effort, in terms not only of man-power but also of finance and materials, which should be a constant preoccupation of the Advisory Committee on Scientific Policy no less than of the Defence Research Policy Committee. The primary need is that these resources should be continually reviewed, not in relation to the efforts of other countries, but in relation to our own changing needs, in the broadest possible perspective. It is only in the light of such a factual survey that measures for the expansion of technical and university education or for any redistribution of effort and resources can be soundly planned.

RECENT ADVANCES IN NUCLEAR SCIENCE

Progress in Nuclear Physics

Edited by Prof. O. R. Frisch. Vol. 4. Pp. vii+379. (London and New York: Pergamon Press, Ltd., 1955.) 70*s*. net.

VOL. 4 of this series, offering a survey of various fields in nuclear physics, seems the most readable one of those published up to now. All the articles are of interest, the problems properly formulated and the English of great clarity, due no doubt to the pains taken by the editor. The topics dealt with are: photodisintegration experiments with nuclear emulsions (E. W. Titterton); scintillation spectrometer statistics (Ernst Breitenberger); meson phenomena and the meson theory (R. H. Dalitz); focusing in high-energy accelerators (T. G. Pickavance); isotopic spin and nuclear reactions (W. E. Burcham); heavy ions of high energy (D. Walker); nuclear properties of the very heavy elements (J. O. Newton); the preparation and chemistry of the transuranium elements (H. A. C. McKay and J. Milsted); and neutron spectroscopy (D. J. Hughes).

To pick out one or the other article for comment seems unfair, but one has one's preferences. The summary on photographic plate studies of the nuclear photo-effect (E. W. Titterton) is excellent, as it does not go too much into technical details but shows up the power of the photographic-plate method, discusses the main results and very thoroughly the theoretical implications. A particularly useful contribution deals with the statistics of the scintillation counter (E. Breitenberger). Those very versatile tools, the 'generating functions', are developed to the point where a physicist can use them, and the author has followed, with their help, the many statistical effects which influence the width of a spectral line caused originally by a monochromatic quantum radiation. It is to be hoped that this article, which seems more like a piece of research, will encourage physicists to treat their fluctuation problems with the help of generating functions. Another impressive piece of reporting comes from the pen of Prof. Burcham on the use of isotopic spin. The crystal-clear and didactically outstanding introduction to the, at first, abstract notion of isotopic spin is very valuable, since the concept is so very useful in low- and high-energy nuclear and meson physics. I would appeal to the theoretical physicists to study it closely and find out how not to create a potential mountain for the experimentalist when explaining theoretical concepts.

The two companion articles on the physics and the chemistry of the very heavy elements are very timely; but it is a pity that they were written just before a large mass of information was being declassified for the Geneva Conference. For a physicist it is fascinating to watch the chemist separate in cation-exchange columns such tough problems as mixtures of the rare earths or the actinide series (see p. 321). This section is of considerable interest to the chemist and the physicist. The printing and reproduction are excellent.

E. BRETSCHER

SEXUAL MORALITY

Sex and Morality

By Prof. Abram Kardiner. Pp. 274. (London: Routledge and Kegan Paul, Ltd., 1955.) 18*s*. net.

Homosexuality

By Dr. D. J. West. Pp. xiii+145. (London: Gerald Duckworth and Co., Ltd., 1955.) 15*s*. net.

IT is a surprising thing that we do not know for certain what is the normal psychosexual development of a human being, or even an animal in the wild. We know, of course, through Freud's patient researches, how human beings develop in our culture and, through anthropological investigations, we have some idea how they develop psychosexually in other cultures; but it is impossible to isolate man from his environment and discover how he would grow up uninfluenced by custom.

Prof. A. Kardiner, in his interesting book "Sex and Morality", points out various developments such as liberalism which made women feel they should be freer, the romantic movement which stressed equality, and finally feminism which urged that women should have careers the same as men. These were protests against previous oppression, but produced profound effects on morality. The invention of successful contraceptive devices and medical advances against venereal diseases freed women from moral impediments and tended to break down custom still further.

Women's attempt to escape from the kitchen and the home and to substitute a career for family life led to compromise and often failure. When there were children there was inevitably some rejection of them, and such rejection has a profound effect on development. It can lead to aggression, which may appear later so that the child becomes a juvenile delinquent heading towards a life of crime. Maternal rejection can also lead to perversion such as homosexuality, or finally to neurosis.

In examining our culture and methods of investigating it, Kardiner discusses the work of Freud and Kinsey. He gives one of the best commentaries on Kinsey's work which have so far been published and, since he has done considerable anthropological work, is able to draw on his experiences to check his conclusions. Far from being purely negative, Kardiner's criticisms enable him to give sensible remedies for many of the troubles which endanger modern civilizations. His book is an interesting one and well worth reading for its forthright views, although not every psychiatrist will agree with them. It is a pity that it is not provided with a better index.

Dr. D. J. West's book on "Homosexuality" is more of a popular medical one and should be easily comprehensible to the non-medical reader. He gives a careful outline of every aspect of homosexuality. It is considered in different communities, including our own, and discussed from the point of view of different types with their effect in creating legal and social problems. Two 'typical' cases are given.

Dr. West examines the influence of the endocrine glands, inheritance and psychological factors in causation. He discusses the relationship of homosexuality to mental abnormality and concludes his work with a somewhat sketchy chapter on treatment and prevention. This suggests that he has not had much practical experience in the therapy of the homosexual.

Medically this is not a controversial book, and it is easy to agree with nearly all that he says; in fact, it is what many psychiatrists have been preaching for the past two decades. His outlook, however, is generous, kindly and reasonable, as one would expect from a medical man educated in psychiatry. The adverse criticism one is inclined to make is that he is over-cautious regarding treatment, which is well worth while in the less-severe cases. There are an excellent index and a long list of a hundred and sixty references in the bibliography. There is also a list of novels which have homosexuality as a subject.

Clifford Allen

OUTLINE OF PARASITOLOGY

Introduction to Parasitology, with Special Reference to the Parasites of Man

By Prof. Asa C. Chandler. Ninth edition. Pp. xiv + 800. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1955.) 68*s*. net.

THE ninth edition of this book, which began its successful career as long ago as 1918, reflects on every page the remarkable advances in knowledge that have so greatly increased our control of animals parasitic in man and other hosts. The book has always been one of the most readable of all books on parasitology. Its author, Prof. Asa C. Chandler, has the gift of the graphic and imaginative phrase; he can put, often in a simple arresting sentence or two, the complex relationships of the parasite and its environment; and man, who has good reasons for thinking that he has conquered some, at any rate, of his parasites, is warned against patting himself too complacently on the back. "In spite of spectacular advances in our struggle with parasites," Chandler says, "it is obvious . . . that the battle is far from won." In 1947 Stoll made the startling estimate that there are in the world to-day 2,200 million helminthic infections [of man]—enough for one for every inhabitant [of the world] if they were evenly distributed". Nor is the author concerned with human parasites alone. He has extended, in this edition, the text that dealt in earlier editions with the parasites of domesticated animals. He also discusses the spirochaetes, rickettsias and filterable viruses that are transmitted to man by arthropods. A number of chapters or sections have been entirely re-written, and changes have been made on every page. These changes are the measure of the advances that have been made since the eighth edition appeared in 1949.

This, therefore, is not a reprint of a formerly successful book. Although the general plan of the book has not been substantially altered, the reader is given a new and up-to-date account of this subject, the importance of which the author so graphically describes in his introduction. The illustrations, formerly not adequate for so valuable a book, have now been greatly improved. They have, no doubt, enabled the author to lighten the text by transferring to the illustrations much of the morphological detail that some readers often find rather heavy going. Besides, it is precisely here, in conjunction with the drawings themselves, that one finds this kind of detail most convenient. Mr. George Newman, of the University of Texas Medical School, who drew most of the new illustrations, is to be congratulated on his work.

Another feature of the book is the fact that classification and taxonomy are given only in so far as they help the student to understand the general relationships of the major groups of parasites; but simple keys for the identification of arthropods are given, and these are set in small type, so that they can be omitted if the reader wishes to do this. The emphasis is on the biological aspects of the subject—on life histories, epidemiology, host-parasite relationships and the principles on which treatment and prevention are based.

References to the literature are given at the ends of the chapters, not all together at the end of the book, as many readers would prefer. A list of journals and books from which further information can be obtained will help the reader who is not familiar with the literature. The make-up of the book has certainly now acquired a new look; it is brighter and generally more attractive to read. This edition will undoubtedly hold for this book the place that former editions have given it.

G. Lapage

MODERN DAIRY FARM PRACTICE

Dairy Cattle

Selection, Feeding, and Management. By Prof. William Wodin Yapp and Prof. William Barbour Nevens. Fourth edition. (Wiley Farm Series.) Pp. xii + 420. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1955.) 38*s*. net.

DAIRY husbandry, depending on many branches of biology, changes as these sciences develop. During the past two decades these changes have been rapid and sometimes revolutionary in character. For example, before the Second World War artificial insemination of cattle was little used in commercial dairy farming, whereas at present half the cows in England and Wales are bred by this method. The third edition of Yapp and Nevens's book issued in 1941 was therefore due for revision, and in the fourth edition the authors have greatly improved the book by completely re-writing the whole to include more recent experimental findings and modern trends in dairy farm practice.

The book remains primarily a student's text-book; but is written in a simple style and can be followed by a reader with little technical knowledge of the subject. Nevertheless, the book covers a very wide field including genetics, nutrition and physiology, and for teaching at university-level an expansion of those sections dealing with the technical background of the subject would seem to be desirable. It must be admitted that this would make the book more voluminous and less attractive to the practical man.

To the farmer and student in Britain, Yapp and Nevens's book will be very useful so long as the reader is familiar with the differences in milk production between the United States and Britain. Apart from Brown Swiss cattle in America, the breeds of dairy cattle are the same in the two countries. In other respects, however, there are differences. The social and economic background of milk production in the United States is the family farm. In that country the summers are warmer and the production of good-quality bulky foods is, on average, easier. Maize and lucerne can be produced in many areas with little risk of a light crop or of a poor-quality product. Since land is plentiful compared with Britain, milk production is often carried on with little purchased feeding-stuffs.

There are certain aspects of the subject that are important in Britain, but which apparently barely merit mention by Yapp and Nevens. One of these is the use of the electric fence for strip-folding grass and fodder crops. Another is the tactical use of nitrogenous fertilizers for flushing swards. However, these are exceptions; and if the differences in environment and differences in terminology and values are borne in mind, this new book on dairy cattle would still merit a place among the most useful half-dozen books on dairy husbandry for the British reader.

It is unfortunate that any book on dairy husbandry begins to be out of date as soon as it is published. Thus, the chapter on artificial breeding was written before the development of techniques using deep-frozen semen. The implications of these changes may be profound, but they must await the next edition; and it is hoped that the fifth edition may follow the fourth before the back-log of new developments becomes too great.

ARTHUR S. FOOT

NORTH AMERICAN MOSQUITOES

Mosquitoes of North America (North of Mexico)
By Stanley J. Carpenter and Walter J. La Casse. Pp. vii+360+127 plates. (Berkeley and Los Angeles: University of California Press; London: Cambridge University Press, 1955.) 75s. net.

SINCE the publication of the comprehensive works of Howard, Dyar and Knab (1912–17), Dyar (1928) and Matheson (1944), our knowledge of North American mosquitoes has greatly increased, and recent literature on the subject has become vast and scattered; nevertheless, a great deal remains to be done. But before taking further steps, it is wise to pause and survey what has already been accomplished, and from such a survey to compile a summary which will enable us to see more clearly what still remains unknown. In this book the authors have presented such a summary. They have attempted to bring together in one volume much of the published knowledge on the mosquitoes of this region, and they have endeavoured at the same time to present the information in as concise and up-to-date a form as possible. They have also kept in mind the needs of the "systematic entomologist, the technician and the field worker engaged in mosquito control".

The first point is well covered, for all statements are fully documented, and throughout the text numerous references occur to the bibliography, which contains nearly eight hundred titles. Regarding other aims, it is well realized that scientific investigation of any organism demands, before anything else is started, that the identification of the organism be established beyond doubt. The authors have therefore first given a general account of the life-history of the mosquito and some instructions on collecting and preparing material for study. They then pass to descriptions of the external anatomy of all stages and the internal anatomy of the female. In classification they have closely followed the system of Edwards and have divided the family Culicidae into three sub-families—Dixinae, Chaoborinae and Culicinae. A rather full account is then given of the North American genera and species of the sub-family Culicinae, which includes all the true mosquitoes.

The descriptions of some hundred and forty species occupy three hundred pages or so, the names being arranged alphabetically under genera or sub-genera. Each description is illustrated with figures of distinguishing morphological features of the adult and larva of that species and is accompanied by brief notes on biology, geographical distribution (first in the world and then by States and provinces of North America) and on medical importance wherever this applies. In addition, keys have been constructed to assist in the identification of females, male terminalia and fourth-stage larvæ, and 127 females are figured on as many full-page plates. All this is rounded off with a systematic index of six pages.

The work is thus an entomological tool to be used rather than a book to be read, and the real value of a tool is only assessed in use. The systematic entomologist or the mosquito specialist may at first regret that the taxonomic niceties of variations among species and the relationships in species 'complexes' are not more fully treated. The technician may think that his side has received insufficient attention, and the field-worker engaged in mosquito control will not find a section devoted to his special activities. But, to include discussions on these matters would have made an already large book even larger, and might even have necessitated a two-volume work. The interested reader will find the titles of relevant publications in the bibliography.

It is clear that it was not the authors' intention to develop these aspects of their subject, but to concentrate first on the essential identifications, and then to provide a starting-point from which workers could proceed further. It is certain that not only those mentioned but also many other people will have frequent need to consult this book, and because of the convenient lay-out they will find it easy to use as a work of reference for some years to come.

Numerical Tables for Nuclear Physics

By Charles Noël Martin. (French and English Texts.) Pp. viii+258. (Paris: Gauthier-Villars, 1954.) Paper 36*s.* 9*d.*; cloth 44*s.* 11*d.*

THIS book is devoted solely to tabulations from a number of semi-empirical formulæ. The first half contains tables of nuclear masses, alpha and beta decay energies, etc., from von Weizsacker's mass formula. All the computations were made by hand without benefit of a machine, and graphical checks were employed. I find it hard to believe that the computational effort put into this book by M. C. N. Martin is in any sense justified. The mass formula has already been extensively tabulated by Metropolis and Reitweisner in America and merits nothing more than a thorough exposition of its many defects.

M. Martin would have done a better service if he had himself confronted the formula with experimental fact, and would have realized that for this purpose, and especially for comparisons with beta-decay data, it is more useful to have tabulations of the parameters usually connoted by M_A, B_A, Z_A, δ_A. It does not seem to be generally appreciated even now that the reliable experimental data are confined exclusively to the trough of the mass valley, so that the parameters B_A and Z_A are relatively ill-determined; on the other hand, nuclei further removed from beta stability (and for which no experimental data are available) are high up the parabolic walls, and their masses and decay energies are particularly sensitive to correct choice of the parameter Z_A of most stable charge.

Many of the tables in the second half of the book are rather trivial and suffer from too extensive tabulation: that makes the book more expensive and more complicated in use. For example, the recoil correction Em/M arising in nuclear bombardments and in alpha decay can be speedily and accurately assessed with a slide-rule. So far as nuclear radii and geometrical cross-sections are concerned, it would suffice to tabulate the cube roots of A and A^2. On the other hand, Coulomb barrier heights in MeV. and the barrier penetration factors involve several steps in computation and are more usefully tabulated. To be just it is necessary to add that, given the need for a table of semi-empirical masses, then M. Martin's production is well presented, well illustrated with examples, and convenient to handle.

J. S. STORY

Seismology

By Prof. K. E. Bullen. (Methuen's Monographs on Physical Subjects.) Pp. viii+132. (London: Methuen and Co., Ltd.; New York: John Wiley and Sons, Inc., 1954.) 8*s.* 6*d.* net.

THE small book under review is a worthy addition to the well-known series of "Methuen's Monographs on Physical Subjects". The chapter headings are as follows: the significance of seismology in physics; macroseismology; instrumental seismology; *P* and *S* waves; fitting elastic wave theory to the Earth; seismology and geology; seismic rays, phases and travel times; Earth models based on seismology; microseisms—seismology and meteorology; and some interesting earthquakes. The first three and last two chapters are shorter than the others. In addition, there are in the text eleven small line-diagrams, three large graphical diagrams, one map and an index.

Prof. K. E. Bullen, who is professor of applied mathematics in the University of Sydney and president of the Section of Seismology and Physics of the Interior of the Earth of the International Union of Geodesy and Geophysics in the present triennium, is a very brave man to try to get the whole of seismology into some forty thousand words, even though he limits the meaning of the word seismology and also freely employs mathematical symbolism including differential equations and triple integrals. His own researches have been largely concerned with travel-time tables and the determination of the numerical values of the physical constants of materials likely to be found at various great depths in the Earth. In this book he states the parts of the scientific method which he has used in his researches, gives the theoretical basis for his calculations, and summarizes the results so far obtained.

In fact, Prof. Bullen has dipped his 'spoon' of mathematics into the 'basin' of seismology, and mathematical physicists will be grateful for the 'taste' he offers them. Should they desire to go further, I would recommend them to begin with "Lectures on Seismometry", by Prince B. Galitzin, in addition to Prof. Bullen's larger book, "An Introduction to the Theory of Seismology" (second edition, 1953).

ERNEST TILLOTSON

Collected Papers on Aviation Medicine

Presented at Aeronautical Panel Meetings of the Advisory Group for Aeronautical Research and Development, Palais de Chaillot, Paris. (AGARDograph No. 6.) Pp. vi+209+38 plates. (London: Butterworths Scientific Publications, 1955; published for A.G.A.R.D.) 37*s.* 6*d.*; 5 dollars.

EIGHTEEN different papers presented at various meetings of the Aeronautical Panel of the Advisory Group for Aeronautical Research and Development, North Atlantic Treaty Organization, are published in this volume. The selection of the various papers in no way covers the field of aviation medicine in systematic form. Instead, the reader is confronted with an unusually random choice of topics, the standard of which varies from the informal and superficial to the advanced and original academic paper one might expect to find in a specialist technical journal. This is due to the different aims of the meetings and also the function of the various authors. In this type of publication, therefore, there is an inherent diversity of approach and level of treatment, all the more apparent owing to lack of editorial supervision. Such criticisms, however, have sometimes been regarded as offset by refreshing variations in style, and in addition the book is very well illustrated. One cannot help feeling, however, that a more limited choice of papers could, with advantage, have been supplemented by the inclusion of discussion abstracts on the more controversial subjects.

Much of the progress of aviation medicine is concerned primarily with research in basic physiological and psychological problems, so that this type of publication should have its appeal to the specialists in these sciences also. A detailed paper by John P. Stapp covers his more important and original work on body tolerances to crash decelerations, and other topics include such subjects as a theoretical approach to cockpit layout, arctic survival, high-intensity noise and visual problems. Of particular interest is a short critical survey of present concepts relating to explosive decompression. Throughout, the reader is left in no doubt that aviation medicine research depends on a detailed application of electrometrical recording techniques, which are also introduced by a composite paper describing recent advances in this field.

F. LATHAM

PHYSIOLOGICAL CONTROL OF POPULATION GROWTH

By Sir SOLLY ZUCKERMAN, C.B., F.R.S.
University of Birmingham

THE heavy consumption of raw materials during the war years of 1939–45, and the phases of shortage that have punctuated the post-war period, have tended to encourage the belief that one day—in the words of the now-famous Paley Report of 1952*—the world will lack the material means to sustain its civilization. The emphasis of the discussion has now begun to shift. To-day we are being increasingly led to believe that modern technology can be relied upon to provide new resources in place of old: nuclear energy for coal; synthetic for natural fibres; and even factory-made food for the food that now grows in the fields. At the same time, however, we are hearing more about the raising of living standards in the under-developed countries, where the bulk of the world's population now lives and multiplies in abject poverty.

The present fear is not that the world's physical resources are in any immediate danger of exhaustion as such, but that plans for the economic growth of 'resource-needy' countries are going to be frustrated by the unrestrained growth of population. This view is the underlying theme of "World Population and Resources", a study recently issued by Political and Economic Planning (*Nature*, January 7, p. 5). It is given further point in the report of the October 1955 meeting of the Consultative Committee for the Colombo Plan (Cmd. 9622), which indicates that population is increasing in the Asian countries far more rapidly than new developments are creating new jobs; and the fear could not be better stated than it has been by the Economic Commission for Asia and the Far East (April 19, 1955) in the words: "despite the strenuous efforts made in the post-war years to increase output and raise levels of living, most countries of the region still found themselves, nearly a decade after the war, with *per capita* real incomes that were either lower than before the war, or barely at pre-war levels". Schemes of economic development may therefore well be nullified if the means are not found for adjusting both sides of the 'population-resources equation' in those 'over-populated' countries where the two are most out of balance.

In these circumstances it is highly encouraging that certain American organizations are making urgent efforts to focus attention on the need to study the problems that are involved in attempts to limit the growth of population. After some preliminary discussions between the Planned Parenthood Federation and the Committee on Reproduction of the National Research Council, the National Academy of Sciences in 1952 convened a meeting out of which emerged a new organization called the Population Council. This was set up with the support of Mr. John D. Rockefeller III; and the next step was the appointment of Dr. Warren O. Nelson, professor of anatomy in the State University of Iowa, as medical director of the Council, with offices in the Rockefeller Institute. Dr. Nelson has made it his business to become acquainted with all work, wherever it may be taking place, that bears on the problem of the control of fertility; and in October 1955 the Council assisted the International Planned Parenthood Federation to gather together at a meeting in Tokyo a number of economists, social workers and students of reproductive physiology. The result was an up-to-date assessment of the present position about the physiology of birth-control.

Reports about population and economic growth, given by the spokesmen of the resources-needy and impoverished countries of Asia, and of countries like Egypt, all struck the same note. Everywhere population was growing much more quickly than new resources were being created, and nowhere was there any adequate method of checking present rates of reproduction, which were high not because of any increase in fertility, but because of sharp declines in mortality-rates brought about by such events as the elimination of malaria following the discovery of DDT. In Japan the situation had become so serious that abortion had been legalized in an effort to reduce the strain of increasing numbers on an economy which has been struggling desperately to recover from the destruction of war.

The physiological papers dealt with possible means of checking or limiting the actual process of reproduction at one of its many stages, and were mainly concerned to show which lines of research held the greatest promise. In a general review, Dr. Nelson considered the various steps of the process, emphasizing particularly those which appear 'vulnerable', and therefore susceptible to 'designed interference'. For example, one of the more vulnerable stages of spermatogenesis is the meiotic division which primary spermatocytes undergo during the process of chromosomal reduction. The nitrofurans and related compounds can inhibit these changes; but their use in human subjects is contra-indicated because they produce undesirable side effects such as nausea and vomiting. Dr. Nelson's view was, therefore, that research along these lines is no more than "mildly encouraging". Such, too, was his general opinion of current efforts to use steroid hormones, and certain plant extracts (for example, species of the genus *Lithospermum*), to interfere with the action of gonadotrophic hormone.

Dr. S. N. Sanyal, of India, who announced some years ago that there was an anti-fertility substance in the legume *Pisum sativum*, presented a paper in which further claims were made for the anti-fertility properties of *m*-xylohydroquinone, the presumably active substance in the pea. Clinical trials were referred to; but the published results are difficult to assess. The results of animal experiments which Sanyal had reported earlier have not been fully corroborated by research workers either in Great Britain or the United States.

Work on plant extracts was also referred to by Dr. A. S. Parkes, of the National Institute for Medical Research, Great Britain, who in addition directed attention to earlier work on anti-gonadotrophins. Both he and Dr. M. C. Chang, of the Worcester Foundation for Experimental Biology, U.S.A., dealt with the part played in mammalian fertilization by hyaluronidase and hyaluronidase-inhibitors; but again the disappointing conclusion was reached that there was no likely prospect that conception could be controlled by the systematic administration of an inhibitor which could inactivate spermatozoal hyaluronidase—an idea which was once thought to hold considerable promise.

---

* Resources for Freedom. In 4 volumes. (Washington, D.C.: Gov. Printing Office, 1952.)

New work on anti-gonadotrophins was reported by Dr. W. O. Maddock. When an animal is injected with gonadotrophins prepared from the tissues of another species, antibodies are formed which are not species specific, so that an animal so treated may become 'immune' to its own gonadotrophins. By proceeding along these lines, Dr. Maddock and his collaborators induced anti-hormone formation in a number of men and women who were receiving daily injections of sheep or hog follicle-stimulating hormone. One month after the cessation of injections, anti-hormone titres were at their maximum, and they usually remained at 'detectable levels' for 2–4 months. Spermatogenesis was apparently unaffected during the first month after treatment; but it was inhibited, as shown by a variety of tests, including testicular biopsies, during the second month. Corresponding signs of the suppression of endogenous gonadotrophin were also observed in the female patients, and in both males and females it was believed that the inhibitory effects of the anti-hormones were more pronounced during succeeding courses of treatment.

The expense, as well as the dependence on medical services of the procedures involved, scarcely encourage one to believe that methods of birth-control deriving from this approach are likely to have any general application in the greater part of the Asiatic world. The experimental results are, however, distinctly encouraging, and it is conceivable that they hold a key to the practical control of reproduction. Another physiological observation which may do the same was outlined by Dr. M. C. Shelesnyak, of the Weizmann Institute of Science in Israel. It has long been known that mechanical irritation of the endometrium during the luteal phase of the œstrous cycle will provoke the formation of decidual cells, and it has also been appreciated that this response can be related to the manner in which a placenta is formed when the endometrium reacts to the presence of an implanting blastocyst. Shelesnyak took as a working hypothesis the idea that a common factor, probably histamine, is always involved when a decidual reaction occurs. This hypothesis proved valid, and further experiment showed that 'histamine antagonists' inhibit the formation of deciduomata. It was then found that a single subcutaneous injection of ergotoxine will interrupt pregnancy in the rat. This physiological observation can be related to the well-established clinical fact that ergot may sometimes act as an abortifacient, although in circumstances which are not clearly understood.

The two communications which excited most attention dealt with the influence of progesterone and related compounds on ovulation, and with the abortifacient effects of a variety of substances described generally as 'anti-metabolites'. The clinical results of the first set of studies remain equivocal, although as Dr. Gregory Pincus, of the Worcester Foundation for Experimental Biology, pointed out, there is no doubt that progesterone can inhibit ovulation in rabbits and apparently, also, in rats. According to his own studies, the indications are that progesterone, when taken by mouth, will also inhibit ovulation in women, as determined by various indirect indices. This view was not, however, shared by Dr. Massomi Ishikawa, whose clinical trials had failed to provide any indication of the suppression of ovulation, though it was possible that the changes induced by the hormone in the cervical mucus might interfere with the penetration of sperm sufficiently to prevent fertilization, nor by Dr. A. Stone, of New York, who also reported on the negative effects of the oral administration of progesterone. These discouraging observations were, to some extent, counterbalanced by a few observations, also reported by Dr. Pincus, which suggest that 19-nor-17-ethinyl-testosterone and 17-ethinyl œstraenolone may be more effective than progesterone in inhibiting ovulation.

The most dramatic story was that of Dr. J. B. Thiersch, of the University of Washington, who discussed the abortifacient action of certain anti-metabolites which are related to various aspects of nucleic acid metabolism, and some of which resemble in their molecular structure naturally-occurring compounds. The investigation began with the observation, made by chance during the course of work on the suppression of cancerous growth, that the folic-acid-antagonist 4-amino-PGA (aminopterin) will destroy the litters of mice, rats and dogs when given in the first trimester of pregnancy. Twelve anti-metabolites were then systematically studied, and nine were found to have a similar effect when given to rats on the seventh or eighth day of gestation. None was able to destroy the whole litter if given before implantation of the embryos, and no compound was effective when given late in gestation. When the drugs failed to destroy all the fœtuses, those young which survived usually developed abnormally, and were born in a malformed state. It was also observed that the placentas frequently survived even when the embryos were destroyed, and also that in certain cases the anti-metabolites had toxic effects upon the maternal organism (for example, on the bone-marrow). The most successful abortifacient in rats was azaserine, or azaserine given in combination with 6-mercaptopurine.

Aminopterin has now been given a clinical trial on twenty-six patients in whom pregnancy had to be terminated for medical reasons. The idea was that the anti-metabolite would be tried first, and in case of failure would be followed by operation. In the great majority of patients the drug acted as an effective abortifacient; but in the remainder there were complications (for example, either an abnormal fœtus was born, or it was necessary for the surgeon to intervene, in which case an abnormal fœtus was found; or general ill-effects occurred in the mother).

It was clear from this, as from all the other physiological papers of the conference, that the practical goal of these urgently needed researches—the discovery of a 'pill' which can be taken by mouth, and the only physiological effect of which would be that of inhibiting the development of the fertilized ovum, or of suppressing ovulation or gametogenesis at will —is so remote from realization that at this stage no one can say how, when or even whether success will ever be achieved. Other communications made it equally obvious that much study will have to be carried out in the field before it will be possible to say how different peoples are likely to react to efforts, officially sponsored or not, to spread a knowledge of birth control. The pressure of population on resources is being felt most acutely in those parts of the world which have never known anything but illiteracy, poverty, overcrowding and squalor. Experience has proved that Western methods of birth control can scarcely be used in such conditions. Moreover, however much some of the people concerned would like, to have small families, most of them are either too ignorant or too resigned even to take the trouble to understand the simple facts that are involved in human reproduction. Great efforts have been made in a few areas to overcome these obstacles; but so far with results that are trivial in relation to the size of the problem.

The situation would obviously be transformed if the 'pill' were ever discovered. But the 'pill' would need to be essentially 100 per cent certain, and commercialization would have to be resisted until the most rigorous clinical trials had been carried out, and until it had been shown that there was no danger of any long-term deleterious effects. The Asian peoples are not provided with lavish medical services, and it would be unthinkable to encourage the use of a drug which was not virtually certain in its action, if its failure meant that a medical man would have to be called in. Moreover, if the drug only affected germ cells or an embryo deleteriously, without destroying them fully, the results could be even more disastrous to the future than the unrestrained growth of population. The West will, therefore, be hurting, not helping, the underdeveloped areas of the world, and would be doing irremediable harm to the good name of Western physiological science, if a 'pill' were launched upon the world before its capacity to satisfy all the desiderata, scientific and social, had been established. But the West will be doing nothing but good if it continues to press on with the kind of physiological research of which the Tokyo meeting provided so useful a résumé.

THE SCIENTIFIC WORK OF BENJAMIN FRANKLIN

By Prof. E. N. da C. ANDRADE, F.R.S.

IN 1746 Benjamin Franklin received from Peter Collinson, of London, a glass tube suitable for carrying out experiments on frictional electricity, with directions as to how to use it*. He set to work on the subject with enthusiasm, writing "For my own part, I never was before engaged in any study that so totally engrossed my attention and my time as this has lately done". He was thus forty years of age (having been born on January 17, N.S., 1706) when he first took up the subject which was to make his name immortal in the world of science, and for seven full years thereafter he was engaged in pioneering experiment, shrewd deduction and simple but penetrating theory. The results of his electrical researches were communicated in a series of letters, beginning in 1747, to Collinson, who was a Fellow of the Royal Society. The publication of these letters as a book in 1751 made Franklin famous throughout Europe and two supplements were issued, the last in 1754. In 1757 Franklin came to England as official representative of the American Colonies, and after that date, although he continued to take a lively, stimulating and practical interest in scientific matters, the pressure of his public duties as a negotiator and statesman made the systematic pursuit of experiment impossible.

One of Franklin's earliest observations, of which he made full use, was on the power of a metal point to discharge an electrified conductor, in his case a large shot insulated by being placed on a clean, dry glass bottle. He generously acknowledged that the first experiment was made by his friend Hopkinson, who, apparently, did nothing to follow it up. If a pointed bodkin was attached to the shot it rapidly lost its charge, as it also did if the bodkin, earthed by being held in the hand, was presented, even at a distance of 8 in., to the shot. If the bodkin was insulated, no such effect took place. He later carried out a similar experiment with a very large charged cylinder made of pasteboard covered with metal foil, when he showed that an insulated man, presenting the point of a needle, became charged. Franklin likewise observed the glow at the point that accompanied the discharge. He put forward an explanation of the discharge from a pointed conductor in terms of the attractive force by which the charged body retained its electrified atmosphere: at a point there was a very small attractive surface and a relative inability to hold the charge. These experiments were to lead to the lightning rod.

Very early Franklin carried out experiments in which a man on an insulating base (a block of wax) electrified a glass tube by rubbing and then communicated a charge to another man similarly insulated. By variations of circumstance, including an earth provided by a man standing on the floor, he came to the sound conclusion that, as he put it, electricity was not created by friction, but collected —that there was a separation of electricity which left behind it a corresponding defect. In consequence, he introduced the terms 'positive' and 'negative' electricity, as still used, the electricity of the rubbed glass being positive. His theory was therefore called the 'one-fluid theory'. He also brought into regular use the terms 'non-conductor' and 'conductor' (the term 'conductor' had already been used by Desaguliers) in place of 'electric per se' and 'non-electric' then in general use.

His work on the Leyden jar, which had been discovered in a primitive form by von Kleist in 1745 but brought into general notice by Musschenbroek, of Leyden, in the following year, added clarity to what was a very obscure subject. He showed that the two coatings were oppositely charged and, in particular, that one coating had to be earthed while the other was electrified. He showed the large part played by the glass in the action—in fact, he declared that the whole power of the jar to give a shock lay in the glass. The correct elucidation of the action of the dielectric had to wait for Faraday. While carrying out this work, he simplified the whole matter by making the first plane condenser, of sheets of glass between plates of lead, the so-called Franklin panes, which enabled the coatings and the glass to be readily separated and conjoined. (Franklin has a note to his Letter IV, of 1748, "I have since heard that Mr. Smeaton was the first who made use of panes of glass for this purpose", but I have been unable to trace any record of this work of Smeaton's.)

---

* With regard to an erroneous date given in Franklin's "Autobiography" and to the general history of Franklin's introduction to the study of electricity, which has been somewhat obscure, see Heathcote, N. H. de V., *Isis*, 46, 29 (1955).

It was, of course, Franklin's work on lightning and the lightning-rod that was chiefly responsible for his scientific fame. He was not the first to direct attention to the resemblance of the light and sound of the electric spark to lightning and thunder. Hauksbee (1705), Wall (1708), Newton (1716) and Gray (1735) had all referred to it casually, the last-named saying, for example, "that power [electricity] which by several experiments . . . seems to be of the same nature with that of thunder and lightning". It was, however, left to Franklin to show systematically that there was something more than a superficial resemblance, that thunder clouds were actually seats of electric charge which could be shown to behave like normal charges and that the action of pointed conductors, which he had so thoroughly investigated, might be used to dissipate the charge or, if this action was insignificant, to attract the lightning discharge and carry it harmlessly to earth, so as to protect buildings. He proposed what is known as the Philadelphia experiment: that a sentry box should be placed on a high building, with a long pointed rod, well insulated, protruding upwards. He anticipated that, when thunder clouds were overhead, a man in the box would be able to draw sparks from the rod by presenting to it an earthed wire, held by an insulating handle. The experiment was first carried out in France, in May 1752, by D'Alibard at Marly and by Delor in Paris independently. It met with a full success, which created a sensation, Delor obtaining sparks nearly an inch long.

It was later that Franklin carried out the famous kite experiment, described in a letter dated October 19, 1752. The lower end of the string of the kite, which became conducting when wet, was attached to a silk ribbon, which insulated it from the hand. Sparks were obtained, a Leyden jar charged and other standard electrical experiments performed. Among the last experiments made by Franklin were some on the sign of the charge on thunder clouds, which he found to be in most cases negative, although occasionally positive charges occurred, which modern observation has confirmed.

Of Franklin's design of lightning rod, pointed above and earthed below, it will suffice here to quote the modern lightning expert Dr. B. F. J. Schonland: "Franklin's specifications for the rod . . . have proved substantially correct".

Other effects of atmospheric electricity were also studied by Franklin. He recognized the aurora borealis for a phenomenon of electric discharge. He stated that the atmosphere at above a certain height was so rare as to be almost a vacuum and therefore a good conductor of electricity. The discharge he supposed caused by electrified vapours rising from the sea and proceeding to the pole, where the non-conducting nature of the ice played a part—an explanation on scientific lines at a time when greater correctness could not be expected. He may be said to have foreseen the ionosphere: "Who knows but there may be, as the Antients thought, a region of this fire [the electric 'fire'] above our atmosphere, prevented by our air, and its own too great distance for attraction, from joining our earth ?".

While it was for his experiments on electricity that Franklin was best known, these constitute by no means his only claims to consideration as a man of science. Among meteorological phenomena he was much interested in whirlwinds and waterspouts, which he recognized as due to the same cause, a very rapid local circulation of the air, with a consequent region of low pressure in the neighbourhood of the axis. He thought, however, that the waterspout consisted of water, whereas it is a cloud of water drops and droplets, and so was puzzled by the height, for he clearly recognized that the atmospheric pressure could not hold up a volume of water more than 30 ft. in height.

There are a host of original observations to be found in Franklin's collected papers. He makes the generalization that good conductors of heat are good conductors of electricity, long before the days of voltaic electricity. He explains that clothes keep the body warm by retaining and confining the natural heat, wool being warmer than cotton because it is a much poorer conductor. He has some penetrating remarks on the cooling produced by evaporation, from which he proceeds to explain the beneficial effects of perspiration in keeping down the body temperature in hot weather.

Everywhere his acuteness is evident. For example, he was, after looking closely into the matter, strongly in favour of inoculation against smallpox; but, after systematic trial, considered that electric shock from the discharge of a Leyden jar was of no use as a cure for paralysis and such-like ills, saying that he had never known any advantage that was permanent. This was at a time when John Wesley was writing of the most extraordinary cures, even of blindness, produced by electric shocks and when Priestley wrote that "electricity is now become a considerable article in the *materia medica*".

As an inventor Franklin is best known for his stove, his 'Pennsylvanian Fire-Place'. He pointed out that with the fireplaces then in use the hot air passed up the chimney, its place being taken by air coming as a violent draught through crevices, which was a great promoter of the common cold. In Franklin's invention the stove stood a foot or so in front of the wall. From the front part where the fire was burning the hot air within the stove rose to strike a horizontal plate and was then led down a pipe of rectangular cross-section, which enclosed a so-called air-box between itself and the fireplace proper. This pipe entered the chimney at floor level. The hot air thus heated the whole stove and, in particular, the sides of the air box, as well as the wall. The fresh air was supplied through a pipe under the floor. In pointing out the saving of fuel and the absence of violent draught Franklin, ever a man of sense and of the senses, directed attention to the fact that one did not lose the pleasant sight of the fire and could also use the flat top to warm flat irons or keep food warm. Among his other inventions the most familiar to-day is that of bifocal spectacles.

It may be fitting to conclude these very brief notes on Franklin's scientific work with words that appear to be little known, though spoken by one of England's greatest natural philosophers, Sir Humphry Davy. They cannot well be bettered. "The experiments adduced by Dr. Franklin in support of his hypothesis were most ingeniously contrived and happily executed. A singular felicity of induction guided all his researches, and by very small means he established very grand truths. The style and manner of his publication are almost as worthy of admiration as the doctrines it contains. He has endeavoured to remove all mystery and obscurity from the subject; he has written equally for the uninitiated and for the philosopher; and he has rendered his details amusing as well as perspicuous—elegant as well as simple".

STATISTICS AND AERODYNAMICS OF THE SEA SURFACE

THE importance of physical oceanography to meteorology arises partly because of similarities in the circulation patterns in the atmosphere and in the ocean and partly through the exchange processes at the shared boundary between them. The atmosphere is thermally driven, the ocean in part thermally but mainly by the frictional drag of the wind. The similarity of their circulation patterns, which exists in spite of their different boundaries, is presumably due to the rotation of the Earth. No realistic theory of the general circulation of either the atmosphere or the ocean is, however, possible without an extension of our knowledge of the transfer of heat, water vapour and momentum at the sea surface.

With this in mind, the Council of the Royal Meteorological Society recently invited papers on physical oceanography for publication in its *Quarterly Journal*. Several such papers have now appeared, and the Society organized two symposia on oceanographic subjects. The first, a joint meeting with the Challenger Society, was held in London on June 15, and the second formed part of the Society's summer meeting, held during July 22–23 at Ashburne Hall, University of Manchester. At both symposia the main topic was the statistics and aerodynamics of the sea surface.

The mechanism by which water waves are initially generated by wind is not yet understood. Distinct from this is a wide variety of problems, ranging from the reflexion and refraction of electromagnetic radiation to the motion of ships, the solution of which needs an adequate description of the statistical structure of the sea surface. One mathematical model which has recently been found to give realistic results is obtained by regarding a physical quantity, such as the height of the sea surface at a given point, as the resultant of a spectrum containing a large number of sinusoidal components of differing frequency the phases of which are uncorrelated. Such a model has been intensively studied by Rice[1] as a description of the statistics of random-noise currents in electronic devices. The word 'random' here implies the mathematical model already mentioned and is often replaced by the word 'gaussian', since on this model instantaneous amplitudes have a gaussian distribution. Many of Rice's results can be directly applied to the statistics of sea waves, for example, the change of height of the sea surface observed at a single point; they are being extended by Longuet-Higgins and others to take account of the movement of sea waves in different directions.

At the joint meeting of the Royal Meteorological Society and the Challenger Society in June, Dr. M. S. Longuet-Higgins gave an account of his paper[2] in which he discussed the distribution of wave heights, measured from crest to preceding or succeeding trough, for the case of a narrow spectrum. In this case the result is the well-known Rayleigh distribution, which has been found to agree closely with observation by several workers, including Commander C. R. Darlington[3], who has recently analysed waves automatically recorded by ingenious apparatus in an ocean weather ship. The good agreement exists in part because the wave records examined have been made by equipment which attenuates components of higher frequency, so that the spectrum is artificially narrowed. Rice has also derived an expression for the statistical distribution of maxima in gaussian noise with an arbitrary energy spectrum. The expression is complicated, but depends on a single parameter which can be derived from the energy spectrum or otherwise; it is applicable to a wide range of geophysical variations. Mr. D. E. Cartwright described his application of the formula to the distribution of the maxima in records of ship motions and ocean waves, the maxima now being measured from the zero line and not, as in Dr. Longuet-Higgins's paper, from an adjacent minimum. The theoretical distribution is in good agreement with those observed for energy spectra of different shape. It is clear from Mr. Cartwright's paper that the mathematical model of gaussian noise, and any extension to it, will be useful in the interpretation of many geophysical time-series, particularly records of ocean waves, and may well suggest physical ideas about the mechanisms which are involved.

From the statistics of the sea surface the meeting then turned to its aerodynamics. One of the most important problems common to oceanography and meteorology concerns the mechanism by which momentum is transferred to the sea surface. The drag and some of the statistics of the sea surface must be closely related; but, since as yet it is not clear which of the statistics are relevant, both statistics and drag are usually discussed in relation to the wind at a known height. The remainder of the meeting was devoted to observational estimates of the drag of the wind on the sea, expressed in terms of the stress coefficient C defined by the equation $\tau_0 \equiv C\rho u^2$, where τ_0 is the surface shearing stress, ρ the density of the air, and u the wind speed at a known height, usually about 10 m. above the surface.

Mr. J. S. Hay read his paper on air flow over the sea[4]. He had measured the vertical distribution of wind velocity to a height of 8 m., from a large raft moored some 800 m. downwind of a Hebridean island. In neutral and unstable conditions, the wind increased linearly with the logarithm of the height; but when the sea was colder than the air, the profiles were slightly curved, being convex to the log z axis. Wind profiles over land in neutral conditions are well known to be represented by

$$u/u_* = (1/k) \log(z/z_0) \qquad (1)$$

where u is the velocity at height z, u_* is the friction velocity defined by $\tau_0 \equiv \rho u_*^2$, k is von Kármán's constant ($= 0{\cdot}4$) and z_0 is a length known as the roughness parameter which is thought to be determined by the statistics of the surface. Making the very reasonable assumption that wind profiles over the sea can be expressed by the same equation, Mr. Hay determined C and z_0 from his observed profiles. Both C and z_0 varied approximately linearly over the range of wind speed of 650–1,150 cm./sec. at 10 m., the former from 0·0016 to 0·0024 and the latter from 0·05 to 0·25 cm. Uncertainties introduced by possible errors in the height of the anemometers were estimated and found to have little effect. Others, such as those due to the platform and to tidal streams, could not be assessed, but the profiles were considered typical of the sea surface in spite of a cliff 60–90 m. high about 1 km. upwind.

Dr. H. U. Roll, a guest of the Society from Hamburg, then gave an account of an investigation he had made[5] by comparing Beaufort force estimates of wind at sea, apparently based on the appearance of the sea surface, with the measured wind in relation to the temperature difference between sea and air. In spite of the experimental scatter, it was clear that for a given Beaufort force the wind was stronger in stable conditions than in unstable conditions. He had also found that the estimates of Beaufort force were linearly proportional to the wind speed 50 cm. above the surface and, by combining the two results, had made estimates of the drag coefficient in neutral, stable and unstable conditions. In neutral conditions, he found that the drag coefficient increased roughly linearly from 0·0008 to 0·002 as the wind at 19 m. varied from 2 to 15 m./sec. Dr. Roll considered these values were in fair agreement with what he thought were the most reasonable earlier estimates, although there was some evidence that at low wind speeds the drag coefficient increased as the wind speed decreased.

After some interesting observations by Dr. H. Arakawa on the complicated wave trains produced by fast-moving typhoons, Mr. J. Darbyshire gave an account of estimates[6] of drag coefficient made by an old method, that of observing the tilt to leeward of an enclosed body of water under the influence of wind. The slope of the surface of Lough Neagh in Northern Ireland had been determined from continuous records of water-level at four points near the shore, and the corresponding winds were taken from anemometer records at Aldergrove nearby. The experimental scatter was such that the variation of drag coefficient with wind speed could not be determined; there was some indication that the drag increased as the wind speed was raised to a power between two and three. Stability appeared to have a marked effect, the drag coefficient for moderate instability being about twice that for moderate stability. The drag coefficient also appeared to vary linearly with the distance between the observing points, indicating a possible effect of fetch. This is an important point which has not been brought out in previous investigations; it deserves further investigation.

It was clear from this joint meeting of the Challenger Society and the Royal Meteorological Society, and from the discussion which followed, that experimental determination of wind stress by any known method is a matter of some difficulty, so that estimates made by different workers are significantly different. Nevertheless, there is a growing belief that the drag increases with velocity rather more quickly than u^2 but slower than u^3. At the summer meeting of the Royal Meteorological Society at Ashburne Hall, two attempts were made to deduce the variation with wind speed, but both were necessarily hypothetical and tentative.

The first[7], by Prof. W. H. Munk, was based on various assumptions, one being that the drag due to skin friction can be linearly added to that of form drag against the waves to give the total drag. The remainder of the paper is concerned with the estimate of form drag, using an extension to Jeffreys's sheltering theory to cover the case when there is a spectrum of waves and not a simple sinusoidal wave-train. It turns out that the relevant statistic is the mean-square slope. Cox and Munk[8] have recently estimated the mean-square slope from photographs of the sun's glitter on the sea surface and find that it varies linearly with wind speed. The overall result is then that the form drag varies as the wind speed cubed. If the drag due to skin friction, approximately proportional to wind speed squared, is added, then the total drag varies with wind velocity in the expected way. Further, since the drag is associated with the slopes of the waves rather than with their heights, the effect of fetch would be expected to be small. Prof. Munk's paper could be, and was, criticized on many points of detail, but there was general admiration for this new and deductive attempt to clarify a major problem—the relation between real and aerodynamic roughness—which has not been resolved even for the simpler case of solid surfaces.

Munk's treatment is in terms of the wind speed at 'anemometer' height, but he is well aware that the variation of wind with height is an important factor, the aerodynamic roughness usually being defined from the wind profile. Wind profiles over water have been investigated by Mr. H. Charnock, whose paper supplemented that of Munk and was read immediately after it. From careful measurements over a large reservoir, he found that the wind speed varies linearly with the logarithm of the height as in equation (1). To characterize the profiles, their slope u_*/k is plotted against their intercept log z_0. This allows a direct comparison with other profiles, including those measured in the laboratory. The agreement is better than expected, and it is surmised that z_0 is comparatively independent of fetch and stability, but is determined largely by u_*. The relation between u_* and z_0 agrees roughly with the simplest non-dimensional relation between them, $u_*^2 = \text{constant} \times z_0$, so that one is led to a generalized wind profile for flow over a water surface:

$$u/u_* = (1/k) \log(gz/u_*^2) + \text{constant},$$

which specifies the drag, given the wind at one known height, the constant being approximately 12·5. This expression is in rough agreement with earlier work but the experimental scatter is large.

These two papers attempted to deal with the same problem from completely different points of view. The conclusions agreed to some extent and pointed to the need for more precise observations. Dr. Longuet-Higgins described an attempt to measure the form drag of the larger waves by making detailed recordings of pressure at the sea surface. The equipment, constructed at the National Institute of Oceanography, consists of a flat circular buoy about 6 ft. in diameter and arranged to float low in the water. Inside are two gyroscopes to record pitch and roll, a vertical accelerometer from which vertical displacements can be obtained, and a sensitive micromanometer to record small variations in air pressure. Successful recordings have already been made at sea and are being analysed.

Other discussion ranged over a wide field and showed the common interest of meteorologists and oceanographers in problems of the sea surface. Judging from these meetings, the Council of the Royal Meteorological Society has no cause to regret its decision to regard physical oceanography as a reasonable extension of its sphere of interest.

H. Charnock

FRUIT AND SEED PRODUCTION*

By SIR EDWARD SALISBURY, C.B.E., F.R.S.
Director, Royal Botanic Gardens, Kew

EVERYONE who owns a garden in which fruit is grown soon becomes aware that the crops of plums and apples are liable to great fluctuations. For these fluctuations the weather is popularly blamed, but is in fact only in part responsible. In so far as we can blame the vicissitudes of our climate, it is important to remember that the flower rudiments, which must be formed for fruit to eventuate, are laid down ten or eleven months before the fruit tree produces flowers. So that the failure of a fruit crop as affected by weather may be due to conditions operating at any one of the critical phases in flower and fruit development, either directly, or indirectly as by affecting the growth hormones. For example, it may be the effect of frost when the flower initials are laid down in June, it may be cold winds at pollination time that prevent the bees visiting the flowers, or late frosts that check the growth of the germinating pollen and inhibit fertilization. But, in addition to these hazards of nurture extending over a period of more than a year, there are inherent idiosyncracies of the kind of plant with which we are concerned.

Some plants only fruit once in their life-time—a characteristic that we are apt to assume is inevitable for the annual. But in fact some annuals, if most of their flower buds be removed, will not only survive from year to year but also can be permitted each season to set a limited amount of seed. Moreover, the fruiting period of annuals varies greatly in length. In many this is quite brief, while in others, such as some strains of the chickweed, flowering and fruiting may extend over months. In a biennial such as the mullein (*Verbascum thapsus*) there is a period of accumulation by the rosette stage during one season, followed by fulfilment in the second, and here again prevention of flowering and fruit formation can prolong the life of the plant. There are, however, a number of unquestioned perennials which only fruit once in a life-time and then die. A classical example is the talipot palm (*Corypha umbraculifera*) that remains in the vegetative state for about forty years, and then all its accumulations of food are spent in one magnificent display of flower and a prodigious production of fruit. Similarly, some bamboos in India exhibit prolonged vegetative growth and then simultaneously flower and fruit over an extensive range of country, with important economic and social consequences.

All these and other such examples might seem to suggest that food accumulation and its depletion were the primary factors, and that all are mere variations on the same theme, since most trees and shrubs have to attain a certain maturity before they produce fruit.

It has been shown by numerous experiments on a variety of plants that the initiation of flower rudiments is greatly influenced by the relative length of daylight and darkness, which may thus not only regulate the seasonal flowering of a species but also its geographical range. It must, however, be emphasized that though photoperiodic stimulation and temperature are clearly important external factors in determining flower initiation and subsequent development, yet for these to operate a certain internal environment is requisite which Klebs termed "ripeness to flower", and the ratio of carbohydrates to mineral nutrients, although not causal as at one time supposed, is probably an important aspect of these internal conditions.

When I was a child the commonly cultivated *Cosmos* was a markedly short-day plant, so much so that it was only stimulated to form flowers so late in the season that the plants would attain a height of six or seven feet and get cut down by frost before the flower-heads opened. The common annual mercury, on the other hand, is indifferent to day-length, but its time of flowering was shown by M. Troupin to be greatly influenced by the temperature at night. If this were high, flower-buds might be formed twelve days after germination, whereas with low night temperatures these might not appear for four weeks.

Nevertheless; the variation in time that elapses before sexual maturity is often a characteristic of the species or variety. Particular interest is attached to the fact that scions obtained from the same individual apple variety grafted on to one type of root-stock always come into bearing early; grafted on another type of root-stock they fruit some years later. Thus it is the vegetative part of the dual organism presented by the grafted apple tree, and not the reproductive partner, that mainly determines the period of fruition.

But whatever root system upon which we graft, we see evidence of the individuality of the reproductive portion from the fact that certain apple varieties such as Ribstone Pippin tend to bear crops every year, whereas many other varieties, such as Blenheim Orange, normally fruit appreciably in alternate years only. The forester also is familiar with the periodic fruiting of oaks and beech trees, which exhibit mast years at intervals, the regularity of which is mainly influenced by climatic conditions. These may shorten or lengthen the interval between heavy crops, but not sufficiently to obscure the general periodic character of their occurrence.

Many trees that occur as natural dominants appear to exhibit periodicity in some degree; and it may well be that this, as I have suggested for herbaceous species of intermittent habitats, has a definite survival value in tending to evade the build-up of large populations of pests and predators. Copious intermittent seed production and seedling populations might thus have marked advantages over the steady annual output at a lower level of fruitfulness.

What determines periodic fruitfulness still remains to be determined; but the fact that drastic thinning of apples early in the year of marked fruitfulness, or prior removal of fruiting spurs, only in part overcomes the biennial fruiting habit, suggests that accumulation and exhaustion of food reserves is but one aspect of a complex problem.

Apart from the more striking intermittences of fruitfulness, there is, in temperate climes at least, a periodicity imposed by the seasons. Quite commonly the seasonal production of seed does not coincide with the conditions favourable for germination, and when these recur the advent of temperature and moisture conditions that would induce germination may occur at times unfavourable to survival.

---

* Substance of a Friday Evening Discourse delivered at the Royal Institution, London, on October 28.

We now know that many seed coats contain water-soluble substances that tend to inhibit germination until removed. Thus seeds of succulent fruits, despite the access of moisture and warmth, remain dormant until after the seed is shed. In very wet seasons these inhibitors may become washed out so that the seeds germinate precociously, and the apparent inconsistence of an inhibitor is realized, in fact, as an asset that, like the dormancy imposed by many seed coats, owing to their impermeability until they have undergone some measure of decay, is in reality a feature which confers a degree of temporal distribution on seedling production that is an insurance against catastrophic elimination.

The seed has a resistance to extreme conditions and a capacity for survival of adverse circumstances far surpassing that of the plant itself. Seeds have been known to survive the temperature of liquid air and that of boiling water. Moreover, the evidence of the seeds of the lotus (*Nelumbium speciosum*) from the Manchurian peat indicates a capacity for the retention of viability for perhaps a millennium. The annual plant has become a marked feature of the desert, where the adverse season is evaded by the resistant seed phase. Further, the abbreviated span of life that many annuals have assumed has not only fitted them for areas with short growing seasons due to natural causes, but also for the artificially limited growing seasons imposed by man's cultural operations. This short life-history of but a few weeks can, under more continuing favourable conditions, be translated into a succession of life-cycles so that if all the offspring of each generation were to survive, the total population at the end of one year would be numbered in thousands of millions. Thus by sheer pressure of potential offspring their successional frequency is well-nigh assured, and many such have become notable weeds.

If a high seed production be one important factor favouring success, and studies carried out on a large number of British species warrant this conclusion, it is nevertheless clear that for a given capacity for food manufacture, determined in large measure by the total leaf surface of the plant and the environmental conditions in which it is situated, the number of seeds produced must in some considerable degree be inversely related to the seed size.

The size of the seeds of one and the same species does not usually exhibit any great variability. Indeed, the grain of primitive wheats was, as we know, a measure of weight to which the nomenclature of the curiously antiquated system of Britain still bears witness. But variation in seed size is by no means negligible in some species, and thus has an important bearing on dispersal as it affects competition.

When we consider the diversity in size of individual seeds of different kinds of plants, the range is astonishingly large. On one hand we have the minute seeds of many epiphytic orchids and parasitic plants that are dust-like and of which more than thirty-five million would be required to weigh an ounce. At the other extreme there is the double coconut (*Lodoicea sechellarum*), the single-seeded fruit of which may weigh 40 lb. It is not surprising that the palm which produces these prodigious fruits does not start fruiting until it is 20–30 years old, and that each fruit takes about a decade to mature. The baby palm after the seed has germinated is not weaned from its bottle for several years, but such is the plentitude of food provided for the young plant that apart from any catastrophe its establishment is almost assured. But such a large fruit can only be dispersed by water, and its very restricted distribution bears witness to the fact that it suffers from the defects of its virtues, as is also shown by records of seedlings that have perished from the burden of their inheritance when stranded with the plumule underneath.

Some years ago, from an extensive study of the seeds of British plants, I was able to establish the fact that there was a marked association between seed size and the natural habitat conditions of the species concerned.

The more advanced the type of plant community of which the species was a normal colonizer, the heavier the seed or fruit tended to be. The more open the vegetation and the less shaded the habitat the smaller would appear to be possible the seed size without detriment to survival. Put in other terms, this seems completely plausible, since the more closed and shaded the community of plants the larger the food reserve requisite to enable the seedling to raise its foliage into a position where it can obtain the essential illumination.

It is undoubtedly true that genetical factors govern seed size and that, in general, related plants tend to possess seeds of similar dimensions. Most members of the Onagraceae, for example, have very small seeds like the willowherbs. The fuchsias, which are largely plants of the forest margins of South America, have seeds that are not much larger, though the enchanter's nightshade (*Circaea*) has quite sizable one-seeded fruits and is a shade plant. Since certain families are often associated with particular types of habitat, it might be thought that any kind of relation between seed size and situation was purely fortuitous. Comparison, however, of the seeds of species belonging to the same genus but occupying differing types of habitat does reveal that the same relation generally obtains, namely, of the smaller seed with the more open type of community.

It is not without significance that many of the most striking of the apparent exceptions are plants which, because of their special modes of nutrition, are to a greater or less extent immune from the effects of shading. Thus, saprophytic and parasitic plants in general, even those of deep shade, have normally minute seeds. An exception among the parasites is the toothwort (*Lathraea squamaria*), which is definitely a shade species, but as it is parasitic on the hazel, lime and wych elm it may well be that the larger food reserve is requisite for the seedling to penetrate to sufficient depth to establish contact with the roots of the host plant. Nearly all orchids, whether saprophytic or not, have minute seeds; but many, and perhaps most of these, are largely if not wholly saprophytic in the early stages of development, and the seedlings are notoriously tolerant of shade.

Some idea as to the small size of orchid seeds can be gained from considering those of the sweet-scented orchids of the chalk downs of Britain, of which it would require more than fifty million to weigh one pound. The seeds of the parasitic broomrapes are not quite so light; but an ounce of these would represent about a million and a half seeds.

Seed size then, I suggest, is to be regarded as mainly determined by the average requirements for establishment. The larger the food supply provided by the parent the better, so long as this does not conflict with other assets of survival value, of which the necessity for dispersal to diminish competition between the offspring and with the parent is one, and number of seeds produced is another. Natural selection has imposed a compromise between these conflicting requirements. It is in the light of such a concept that we must consider fruit and seed production.

It is manifest that species of open habitats, particularly those which are pioneers on bare soil, are in the best position to dispense with a large food reserve, and they are also those which can most benefit from a large seed output because such habitats offer ample colonizing space. It is, in fact, among such that the smaller seeds and the larger outputs are to be encountered; but, apart from the special nutritional classes already referred to, the maximum outputs appear to be associated with what I have termed the species of intermittent habitats—those environments such as woodland clearings or bare mud exposed during periods of drought which offer, periodically, habitats for the opportunists of the vegetable kingdom. In the woodland the foxglove and the mullein are examples, while on the mud we might cite *Chenopodium rubrum* and *Veronica anagallis*. The individual fruits of the foxglove usually contain more than a thousand seeds, there being normally more than eighty capsules on one plant, and the average seed output of a plant is more than 85,000. The largest specimens, however, may produce well over a million seeds. The stupendous populations that are sometimes encountered on areas of felled woodland are in marked contrast to the few individuals that are to be found at the woodland margins during the intervening period. So, too, the mullein (*Verbascum thapsus*) produces more than 226 capsules, each containing about six hundred seeds; the average output is therefore about 136,000 seeds, and the largest specimens I have seen must have produced more than 1,200,000 seeds. A single pod of a vanilla orchid was estimated to contain some sixty thousand seeds, and a single plant may produce more than thirty such, or some two million seeds.

The red orache (*Chenopodium rubrum*) is often seen on manure heaps and rich garden soil; but, as a really wild plant, it is a feature of the exposed mud of ponds and reservoirs, where almost pure stands sometimes occur, developed from seeds dormant in the mud for many years, and a rough estimate of the productiveness of such plants was well over 250,000.

It is worth noting that what has been described as the smallest British flowering plant, the chaffweed (*Centunculus minimus*), grows on exposed mud, and having regard to the very small leaf area it presents its output is remarkable, namely, an average of 245 seeds, but these, needless to state, are very small, weighing only about 0·00003 gm.

Herbert Spencer believed, and the view was widely accepted, that seed output of a plant was proportional to the risks of its survival. It is obvious that such risks must be covered by an adequate insurance, and the comparative stability of plant populations over long periods might lend colour to this view. But that it is entirely misleading is obvious from the fact that those species which would be expected to take out the highest premiums in the form of a large output have taken out a low one. Indeed, it is usually the rarest species and those which demand the most specialized conditions that have the smallest seed production, while it is the commonest and most widespread that form large numbers of seed. The common pink centuary (*Centaurium umbellatum*), so widespread on the chalk downs of Britain and in woodland rides, has an average production of about eleven thousand seeds, whereas the local *Centaureum littorale* produces an average of approximately two thousand. The water plantain (*Alisma plantage*), that is to be found in almost any shallow pond, averages some thirty-six thousand, whereas the rare and local starwort (*Damasonium alisma*) produces a meagre 230, of which perhaps not more than one-quarter are viable.

It is probable that one of the reasons why many species are rare is because they are unable to exert sufficient population pressure. That they are able to survive despite the low premium they pay in seed output may well be in part due to greater precision in dispersal as, for example, by birds that frequent the particular type of habitat that they and the plant share. Moreover, it is generally true that the more specialized the habitat conditions the fewer the number of species associated with them. If we think of plants for our present purpose as belonging to two categories, namely, the specialists and the general practitioners, the former at the sacrifice of a more limited range of possible habitats are likely to be confronted with a smaller range of competitors and perhaps fewer of them. Thus the probability of similar demands in time and space from their associates are appreciably lessened.

It follows from what has been said that, in general, trees will possess the heaviest seeds because so many of them are natural inhabitants of shady places, and in the British flora the trees with light fruits, such as the birch, the pine and the ash, are colonizers of the open and pioneers, while the trees of the closed woodland, such as the oak and the beech, have fruits with appreciable food reserves. In the tropics, however, many tree fruits are very large. The double coconut is a shade species of palm, while the fruits of *Caryota mitis*, a palm which grows in open situations, are comparatively small. We are all familiar, too, with the large stones of the avocado pear and the mango, both of which are shade trees. The seeds of *Paulownia*, one of the few scrophulariaceous trees, are small, like those of other members of the family. Again, jungle climbers may have very large seeds, and in this connexion the genus *Entada* is of interest as illustrating effective water dispersal which obviates one disadvantage accruing to large seeds. Some few years ago, when staying with the Van der Byles at Caledon, Cape Colony, Lord de Saumarez came in to dinner bringing with him to show me two seeds that he had picked up on Cape Agulhas, the southernmost point of the African continent. One was *Entada scandens* and the other *Entada gigas*, the latter a native of the West African forests and the former of the forests of the Amazon valley. From the distribution of the ocean currents it is probable that the large seeds of the *Entada gigas* were washed into the sea off the West African coast, carried across the southern Atlantic towards the mouth of the Amazon, and thence carried back in company with its congener, *Entada scandens*, to the beach at Cape Agulhas. Seeds of *E. scandens* often reach the coast of Cornwall and have been found to be viable, and I have little doubt that these from South Africa were also. Similarly, the dangerously hooked fruits of *Harpagophyton* are so efficiently dispersed by animals, whose death they not infrequently bring about, that their large size is not detrimental except in so far as it limits their number.

The seeds of many members of the marrow family are of only moderate size, but the fruits in which they are contained are among the most diverse in size and form, and some attain large dimensions even in the wild state. They are dispersed by flotation, and after the fruits cease to be buoyant the seeds will often float for weeks.

Unless the dispersal of fruits or seeds be reasonably efficient, it is manifest that no advantage will accrue from a large output and little from a large food supply, and the great diversity of so-called dispersal mechanisms is evidence of their considerable survival value; but beyond a certain efficiency the higher the output consistent with adequate reserves in the seed for establishment, the greater the frequency of the species is likely to be.

It is worth noting that man, in the cultivation of his fruits, has often selected out seedless types. Sometimes this is the outcome of hybridization and resultant genetic infertility; sometimes it is the accompaniment of the mere replication of chromosomes. The seedless banana, the seedless orange and the pineapple are familiar examples of such fruits, which emphasize for us that fruit formation and seed production, though commonly associated phenomena, may be independent of one another. We can indeed, by the use of artificial growth-promoters, cause pears to develop which contain no fertile seeds. In the wild state we find that chromosome replication is not infrequently accompanied by a reduction in fertility but an augmentation of vegetative propagation. Thus, many woodland species that have low seed outputs spread rapidly by runners, of which a striking example is afforded by the lesser periwinkle (*Vinca minor*), which flowers freely but very rarely fruits, yet spreads with remarkable rapidity. The vegetative mode of propagation has many advantages in a shady habitat.

All the evidence we at present possess would appear to lead to the conclusion that seed output is an important factor in successful colonization, and its magnitude is as much a character of the species as height or any other of its variable qualities.

OBITUARY

Prof. P. A. Buxton, C.M.G., F.R.S.

The news of the death of Prof. P. A. Buxton on December 13 at his home, Grit Howe, Gerrards Cross, shocked and sorrowed his friends and admirers in all parts of the world. Only a year previously he was travelling through difficult forest country in Central America, a few months ago he was still castigating committees with his caustic wit, and right up to the end he was giving that critical help to his colleagues and students for which they will never find a substitute.

Buxton was born on March 24, 1892. He read the Natural Sciences Tripos at Trinity College, Cambridge, and received his medical education at St. George's Hospital. He became acquainted with tropical conditions first during the First World War in Iraq and Iran, then for two years in Palestine and later for two years in the Pacific Islands. In 1926 he became director of the Department of Entomology of the London School of Hygiene and Tropical Medicine, and in 1933 professor of medical entomology of the University of London, appointments which he held until his death. He was elected a Fellow of the Royal Society in 1943, was made C.M.G. in 1947, received the Mary Kingsley Medal of the Liverpool School of Tropical Medicine in 1949 and was awarded the Linnean Gold Medal in 1953.

Buxton altered the course of medical entomology from museum systematics to the study of the living insect, its physiology and its relationship to the environment. His highly original mind was drawn to this practically unexplored field, and a series of classical papers followed. From these observations he was able to synthesize the findings in five books, characterized by the most lucid exposition of the subject. The first, "Animal Life in Deserts", was reprinted in 1955, and is in constant use by a circle of workers much wider than entomologists. Then after his visit to the Pacific appeared three volumes dealing with medical conditions and entomology in Samoa and other islands. His book on the louse went into two editions and is a perfect example of his outlook. Finally, two works on trypanosomiasis and the tsetse fly appeared, first a preliminary memoir and then, just before his death, the comprehensive "Natural History of the Tsetse Flies", a book which all workers in Africa have been awaiting for years.

Buxton's creed may be summed up in his own words: "field observations are a necessary preliminary, but their function is to set problems which should be solved in the laboratory". He communicated this point of view to some carefully chosen students, all of whom have attained positions of eminence in this field; he thus founded a school of thought which has the strongest influence wherever entomology is studied. Buxton's own journeys helped this dissemination, for not only was he widely travelled but also foreigners found him *sympathique*.

The part that Buxton played in introducing the synthetic insecticides into medicine is perhaps not fully recognized. Early in 1943, the insecticide DDT was brought to him from Switzerland, where it had recently been resynthesized; he immediately appreciated its significance, and he was largely responsible for its rapid introduction as an insect killer in the various theatres of the Second World War.

Buxton's advice was sought more and more frequently by committees or councils at home and abroad, and much of his time latterly was occupied in this way; he never really liked this diversion from his research and teaching, but felt that it was his duty as a scientist to give advice to official bodies; and they always got it in forthright terms. He was due for 'retirement' in two years time, and he had already acquired a subject which would have kept him busy for years; he had started studying the breeding of Diptera in fungi, and only twelve months before his death he bought a binocular microscope with which to observe these flies at his house in Gerrards Cross. Many people all over the world will remember his garden there, its interesting plants and trees, and above all, the welcome they received.

P. C. C. Garnham

NEWS and VIEWS

Geology at Bedford College, London: Prof. Leonard Hawkes, F.R.S.

The retirement of Prof. Leonard Hawkes from the chair of geology at Bedford College, University of London, is a milestone in a life devoted to the establishment of a university department renowned for the liberal and cultural bias of its geological teaching. Between the World Wars, as the first occupant of the chair, Prof. Hawkes brought to his task experience gained in the Universities of Durham and Kristiania, and enlivened the substance of his teaching with much original research, some of it exploratory research in difficult ground, on the volcanic history, the petrology and the geomorphology of Iceland. For many years he has been a wise counsellor in geological affairs, notably in the activities of the Geological Society, of which during 1934–42 he was an honorary secretary and afterwards a vice-president; and he is known with affection and regard by many younger geologists as a tolerant and generous friend. His qualities as scientist, educator and administrator were recognized by the award by the Geological Society of the Murchison Medal to him in 1946. His Department did not escape the devastation of war, and in 1945 he was faced with the burden of planning its rebuilding. He leaves Bedford College in the sure knowledge of foundations well laid and superstructure well designed in both material and academic senses.

Dr. Basil C. King

Prof. Hawkes's successor, Dr. Basil King, has had a varied career in the Colonial Survey service and in universities. A graduate of Durham, London and Glasgow, he was for more than ten years a petrologist and field-geologist in Uganda and Nigeria, where he contributed greatly to knowledge of Pre-Cambrian and igneous rocks, and to the exploitation of economic minerals. Returning to Britain in 1948 to become senior lecturer in the University of Glasgow, he has achieved high distinction for his researches on petrogenesis, notably on rock transformations in the granitic suite. His work on ancient volcanoes is illustrated by reconstructions of former conditions in Arran and in Africa—a continent in which he continues to take an active interest most recently expressed by the survey of an igneous field in Bechuanaland. Latterly, structures in the Scottish Highlands have attracted his attention and are being studied by a small research team under his supervision. A lucid and persuasive lecturer, he is an effective tutor and administrator in university extramural work. By a happy coincidence, he returns to Bedford College as professor in the Department in which he received his first professional appointment twenty years ago.

Physical Chemistry in Queen Mary College, London: Prof. K. W. Sykes

Dr. K. W. Sykes, senior lecturer in the University College of Swansea, has been appointed to the newly created chair of physical chemistry in the University of London, tenable at Queen Mary College. Dr. Sykes read chemistry at Oxford, where he held the Rigge Exhibition and Percival Benefaction at the Queen's College. After obtaining first-class honours in 1943, he carried out research on war-time problems under Sir Cyril Hinshelwood for his D.Phil. He remained in Oxford for a further three years as an I.C.I. Fellow, and in 1948 was appointed to a lectureship, and in 1951 to a senior lectureship, in the University College of Swansea. At Swansea Dr. Sykes had the task of completely reorganizing the course in physical chemistry and establishing a school of research. Dr. Sykes's own researches have been mainly in the field of solid – gas reactions, to which he has made distinguished contributions; he has also published important papers on the ferric – iodide reaction and on complexes of the ferric ion. Dr. Sykes is a chemist with wide interests, and his appointment will be a great asset to the growing school of chemistry at Queen Mary College.

Capper Pass Awards for Papers on Metallurgy

The following Capper Pass Awards have been made by a joint committee representing the Institution of Mining and Metallurgy and the Institute of Metals for papers published during 1954 in the *Transactions* of the Institution and the *Journal* of the Institute: £100 to G. Lawrie Fairs (a method of predicting the performance of commercial mills in the fine grinding of brittle materials); £100 to F. King and Dr. A. N. Turner (control of quality in the hot and cold rolling of aluminium and aluminium alloys); £50 to G. L. Hopkin, Mrs. J. E. Jones, A. R. Moss and D. O. Pickman (arc melting of metals and its application to the casting of molybdenum); £50 to Prof. M. Rey (flotation of oxidized ores of lead, copper and zinc). The Awards are made from a fund given by Capper Pass and Son, Ltd., for the encouragement of scientific and technical papers on processes and plant used in extraction metallurgy and on the subject of assaying, and also papers and processes used in all branches of the non-ferrous metal industry.

Government Support of Agricultural Research in Britain

The Agricultural Research Bill, which received an unopposed second reading in the House of Commons on December 13, provides that, except for Scotland, the financial and general administration of the grant-aided research institutes in England and Wales, as well as their scientific direction, will be unified under the Agricultural Research Council; the institutes will accordingly be transferred from the Vote for the Ministry of Agriculture, Fisheries and Food to the Vote for the Agricultural Research Council, which will be removed from that of the Treasury and appear under a separate head. It is also proposed to reconstitute the appropriate Privy Council Committee so that in future it consists only of the Lord President of the Council, the Minister of Agriculture and the Minister representing the Scottish Department, and to amend the Charter of the Council so that the two Departments have direct representation on the Council. To avoid constituting the Council as a separate government department and making certain research workers Civil servants, an Agricultural Research Fund is to be set up, which will receive an annual Parliamentary grant-in-aid.

The Bill was introduced by the Minister of Agriculture, Fisheries and Food, Mr. D. Heathcoat Amory, and was also welcomed by Mr. Thomas Williams for the Opposition, who urged the importance of increasing the support for agricultural research. Sir Leslie Plummer pointed out the necessity of planning research for more than one year at a time, and this was widely supported in the debate. It was also suggested that the Agricultural Research Council should make increasing use of the universities for research. In replying to the debate, Mr. G. R. H. Nugent, the Parliamentary Secretary to the Ministry of Agriculture, Fisheries and Food, admitted the need for such long-term planning, but pointed out that an annual Vote would be needed, even with a quinquennial programme. He thought the arrangements for disseminating the results of research are working well, and, in reply to questions as to a veterinary research council, said that this had been considered by the Lord President but was thought to offer no advantage at the present time. Eleven of the sixteen experimental farms and six out of seven horticultural experimental farms have been established.

British Section of the International Union for the Study of Social Insects

A NUMBER of entomologists present in Amsterdam at the ninth International Congress of Entomology in 1951 felt that an organization should be formed to bring together those scientists who were engaged in studying the physiology, biology or systematics of the social insects. Thus the Union Internationale pour l'Étude des Insectes Sociaux was initiated, under the presidency of Prof. P.-P. Grassé. The purpose of the Union has since been expanded to include researches on gregarious insects. A Congress was held in Paris in 1952, followed by a highly successful one at Würzburg earlier this year ; the next Congress, in 1957, will again be held in Paris. The international journal *Insectes Sociaux*, published in Paris, is completing its second volume. National Sections have been formed in many countries, but until recently British workers in this field have been members of the French Section ; however, a British Section has now been formed under the chairmanship of Dr. J. D. Carthy. The subscription to the Section is 10*s*. a year, which includes membership of the International Union, and the Union supplies members with lists of current papers on the subject and notes concerning the activities of the Union as a whole. The cost of *Insectes Sociaux* is 2,000 francs a year for members and 3,000 francs for non-members. The honorary secretary of the new Section is Dr. C. G. Butler, of the Bee Department, Rothamsted Lodge, Hatching Green, Harpenden, Herts, from whom further information can be obtained.

The Breeding of Laboratory Animals

IN the past, experiments on animals were usually done in qualitative terms. To-day biological research has become quantitative in character, and with this approach it is becoming evident that healthy, vigorous and uniform stock is essential for controlled experimental studies and for assaying drugs and other therapeutic agents not susceptible to chemical standardization. What is needed are standardized animals or ones nearly so ; Mr. A. L. Bacharach suggests that a standardized animal is to the biologist what a pure reagent is to the chemist. The way in which these animals might be bred was described at a symposium organized by the Laboratory Animals Bureau on May 9, 1955. The subjects discussed included some aspects of animal production for routine biological assay ; genetical aspects of the breeding of laboratory animals ; the value of littermate controls in endocrinological research ; pre-natal and post-natal reproductive wastage ; and the problems of a curator of a small animal breeding station at a university. The papers, and some of the ensuing discussion, have now been put together in book form and can be obtained from the Laboratory Animals Bureau, Medical Research Council Laboratories, Holly Hill, Hampstead, London, N.W.3 (7*s*. 6*d*.).

Linen Research Association : Annual Report

IN proposing the adoption of the report of the Council of the Linen Research Association and the accounts at the annual general meeting of the Association on December 16, the chairman, Mr. H. B. McCance, said that the trade subscriptions now amount to £32,385 compared with £7,033 in 1939, and the floor space of the Institute has been increased from 33,408 sq. ft. to 45,837 sq. ft. In seconding the motion, Mr. M. Wallace expressed the opinion that any fundamental change in the basic methods of preparing and spinning flax is unlikely, but that the servo-drafting control mechanism is an example of how new control methods can be applied to improve an old process. The director of research, Dr. A. J. Turner, in his report, instanced the reduction of lick-up on the rollers of preparing frames by simultaneous application of a number of auxiliary devices, as an example of the real progress being made towards the solution of obstinate spinning problems. In the Weaving Department attention has been concentrated on the improvement of the preparatory processes, while in the Chemistry Department much further experience has been obtained of synthetic resin finishes and promising results obtained in applying new synthetic compounds in waterproofing flax canvasses. After stressing the new opportunities for research and the importance of maintaining a scientific staff of high calibre, Dr. Turner said that the Institute's studies of the processing of such fibres as acetate rayon; nylon, 'Terylene' and 'Orlon' have already accumulated a considerable store of knowledge on these fibres, individually and in blends; he expressed the belief that man-made fibres could be introduced with advantage into the textile economy of Northern Ireland and that the dry-spinning industry in Scotland would likewise benefit from these investigations.

Peaceful Uses of Atomic Energy

THE Association of Scientific Workers and the Labour Research Department have produced a useful pamphlet on the "Peaceful Uses of Atomic Energy" (pp. 16 ; 1955 ; from the Association ; 6*d*.), which is designed to give the ordinary citizen a clear idea of the nature of nuclear science and the nature and possibilities of nuclear power, particularly for Britain, including the uses of radioactive materials. The pamphlet is simpler and much shorter than that of the Central Office of Information on "Nuclear Development" or the White Paper "A Programme of Nuclear Power". Though the pamphlet does less than justice to British developments with radioactive isotopes, it can be commended as likely to assist the general understanding of potentialities in this field. Little is said of the demand its development may make on our resources of materials or of scientific man-power.

Chemistry of Colouring Matters : Symposium in London

A SYMPOSIUM on 'Recent Advances in the Chemistry of Colouring Matters" has been arranged by the Chemical Society and will be held in the Royal Institution, Albemarle Street, London, W.1, during the afternoon and evening of February 2. There will be two sessions, under the chairmanship of Dr. R. P. Linstead and Sir Alexander Todd, respectively, at which papers on the following topics will be read: steric effects in azo and indigoid dyes (Wallace R. Brode); cis-trans isomerism in azo-dyestuffs (R. H. Peters and E. Atherton); synthesis of azaporphins and related macrocycles (J. A. Elvidge); synthetic carotenoids (O. Isler, H. Lindlar, M. Montavon, R. Rüegg, G. Saucy and P. Zeller); and modern theories of colour (M. J. S. Dewar). The papers and subsequent discussion will be published later as No. 4 in the Society's series of "Special Publications". Advance proofs of the papers and admission tickets for those other than Fellows of the Society can be obtained from the General Secretary of the Society at Burlington House, London, W.1, to whom all inquiries relating to the symposium should be directed.

University of London: Appointments

The following appointments have been made in the University of London: Mr. J. G. Ball, head of reactor metallurgy in the Metallurgy Division of the Atomic Energy Research Establishment, Harwell, to the University chair of physical metallurgy tenable at the Imperial College of Science and Technology; Dr. Walter Murgatroyd, principal scientific officer, Atomic Energy Research Establishment, Harwell, to the University chair of nuclear engineering tenable at Queen Mary College; Prof. H. O. W. Richardson, professor of physics in the University of Exeter, to the Hildred Carlile chair of physics tenable at Bedford College; Dr. L. Fowden, lecturer in botany at University College, to the University readership in plant chemistry tenable at that College; and Dr. C. W. Jones, lecturer in applied mathematics in the University of Liverpool, to the University readership in applied mathematics tenable at the Imperial College of Science and Technology.

Oversea Service Division, Colonial Office

The following appointments have recently been made in the Oversea Service Division, Colonial Office: D. R. E. Jackson (agricultural officer, Eastern Region, Nigeria), senior agricultural officer, Eastern Region, Nigeria; A. Johnston (plant pathologist, Federation of Malaya), senior plant pathologist, Federation of Malaya; N. W. Smyth (agricultural officer, Sarawak), agricultural officer, Bechuanaland Protectorate; G. A. Southwell (agricultural officer, British Honduras), agricultural officer, Grenada, Windward Islands; R. M. Steven (senior agricultural officer, Sierra Leone), principal agricultural officer, Sierra Leone; J. W. Bride (assistant conservator of forests, Sierra Leone), assistant conservator of forests, Northern Region, Nigeria; J. L. Coldwells (assistant conservator of forests, Gold Coast), assistant conservator of forests, Nyasaland; J. E. M. Horne (assistant conservator of forests, Federation of Nigeria), principal, Forestry School, Federation of Nigeria; J. J. Lawrie (assistant conservator of forests, Somaliland Protectorate), principal forestry officer, Somaliland Protectorate; J. S. Lightbody (assistant conservator of forests, Nigeria), assistant conservator of forests, Kenya; L. A. W. Hayward (senior scientific officer, Federation of Nigeria), principal scientific officer, West African Stored Products Research Unit, Department of Marketing and Exports, Federation of Nigeria; D. L. Johns (research officer, East African Tsetse and Trypanosomiasis Research and Reclamation Organization), senior scientific officer, East African Tsetse and Trypanosomiasis Research and Reclamation Organization; R. Hill, agricultural officer, British Solomon Islands Protectorate; I. M. Johnson, agricultural officer (soil conservation), Kenya; J. M. Bigg and J. R. F. Lushington, assistant conservators of forests, Tanganyika; R. F. Mackenzie, assistant conservator of forests, Northern Region, Nigeria; W. S. Moffat, geologist, Gold Coast; T. L. Gracey, assistant bacteriologist, Medical Department, Jamaica; F. Lothe, pathologist, Medical Department, Uganda; M. W. Service, entomologist, Malaria Service, Federation of Nigeria; M. C. Round, field zoologist, Veterinary Department, Kenya; J. R. Wells, veterinary officer, Uganda; M. J. Cawderry-Hope, scientific officer, East African Tsetse and Trypanosomiasis Research and Reclamation Organization; G. A. H. McClelland, scientific officer, East African Veterinary Research Organization.

Announcements

The Royal Academy of Sciences in Sweden has elected the following to foreign membership: Prof. T. H. Goodspeed, professor of botany in the University of California, Berkeley; Dr. Mervin J. Kelly, president of the Bell Telephone Laboratories; and Sir Geoffrey Taylor, of Cambridge, Yarrow research professor of the Royal Society.

The Esso Development Company has made a grant (for one year in the first instance) to the University College of North Staffordshire to support a postgraduate research student in the Department of Chemistry. The work will be concerned with cationic polymerization, under the direction of Dr. P. H. Plesch.

Three new appointments to senior positions have recently been made in the United Nations Food and Agriculture Organization: Mr. Joseph L. Orr (United States), since 1951 special assistant to the Director-General, will be the Organization's liaison officer at the United Nations Headquarters; Mr. Harold L. Vogel (United States) will be the representative of the Director-General in North America; and Mr. Adolfo Alarcón (Mexico) will be the regional officer for Mexico, Central America and the Caribbean.

The Medical Research Council is offering a further series of fellowships in clinical research, tenable at centres in the United Kingdom during the academic year 1956–57. The fellowships, which may be renewed up to a maximum of three years, are worth £950–£1,100 a year, and are open to medical graduates with some clinical experience who wish to prepare themselves for a career in clinical research. Application forms, to be returned by March 1, and further information can be obtained from the Secretary, Medical Research Council, 38 Old Queen Street, London, S.W.1.

A symposium on "Perspectives in Marine Biology" will be held in the Scripps Institution of Oceanography, La Jolla, of the University of California, during March 24–31 under the joint sponsorship of the Institution and the United States Office of Naval Research. The discussion will be centred on potential developments in marine biology rather than on past accomplishments, and a large number of scientific workers from outside the United States have been invited to participate. Those wishing to attend should write to Prof. A. A. Buzzati-Traverso, Scripps Institution of Oceanography, La Jolla, Calif.

GENERAL ELECTRIC RESEARCH LABORATORY, SCHENECTADY

NEW METALS AND CERAMICS BUILDING

By ROBERT L. FULLMAN
Materials and Processes Section,
AND
ROBERT M. PARKE
Materials Application and Evaluation Section,
Research Laboratory, General Electric Company, Schenectady New York

A NEW Metals and Ceramics Building was dedicated late last summer in Schenectady, N.Y., as the facilities of the General Electric Research Laboratory were enlarged. The new building reflects the current widespread interest in research into metals and ceramics, and is part of a 15-million dollar expansion programme now being undertaken at the Laboratory.

The programme of work to be undertaken in the new building includes the following: (1) to ascertain and analyse the areas of most critical need for materials and processes; (2) to develop new processes for new businesses; (3) to develop new materials to improve products; (4) to study existing materials and obtain a better understanding of their properties and processing; (5) to operate pilot plants and obtain economic data.

Dr. J. Herbert Hollomon, manager of the Metallurgy and Ceramics Research Department, has stated that the constant growth of the General Electric Co.—and the ever-increasing diversity of the Company's needs—have necessitated the expansion of the facilities available for such work. "In addition," he says, "it is now more important than ever that the Research Laboratory's scientific understanding should be used for helping to solve any critical problems relating to materials and processes that may stand in the way of Company progress. The organization of the new Metals and Ceramics Building includes the establishment of a group of scientists to seek out and solve problems pertaining to materials and processes wherever they may appear in the Company. Thus, in the new building, amid facilities of both laboratory and industry size, the promising findings of our outstanding group of metallurgists, ceramists, physicists and chemists can be applied to the kind of problems now creating a bottleneck at the designer's level."

One field in which the Metals and Ceramics Building is expected to make significant contributions is in studies of the effect of the 'scale factor' on the properties and processing of materials. Investigation of the effect of large increases in the scale of operations during the transition from laboratory work to production previously has been among the least explored fields of metals and ceramics research. Studies in this field will include the feasibility and the probable cost of factory-size operations.

The General Electric Metals and Ceramics Building is for this reason one of the few facilities in existence which makes available to the research worker production-size equipment unrestricted by the scheduling demands of actual production. When the building was being planned, the size of the machines was to a large extent determined by the quantities of material that would have to be produced in order to make possible a realistic evaluation from the point of view of production. The size of some furnaces, for example, was determined by the smallest quantity of metal that would permit the manufacture of at least one complete product, such as a transformer, for evaluation purposes. The advice of manufacturing components of the Company was, therefore, sought in ascertaining practical limits of equipment capacity for pilot-plant production.

In order to allow the most efficient use of the variety of equipment, the building has been constructed for maximum flexibility, using what has been referred to as the 'erector set' principle. In this method of construction thousands of bolt holes are aligned throughout the structure of the building, permitting easy re-location of equipment. Consequently, as one research project is completed, another may be set up with a minimum of time and effort.

The available processing equipment includes arc-melting furnaces capable of melting highly refractory metals under vacuum and in inert atmospheres. Furnaces of this type are needed because many alloys now under investigation cannot be melted by normal commercial techniques. Vacuum arc-melted ingots of 300 lb. can be produced at the rate of three a day, while it is expected that in the future, by a continuous process, it will be possible to produce ingots weighing four thousand pounds or more. An industrial-type three-phase arc furnace for the preparation of one-ton heats of steel, and induction furnaces for melting metals and alloys in vacuum, controlled atmospheres or in air are also available.

Forming equipment includes a hydraulic extrusion press of 1,250-ton capacity, specially designed for rapid extrusion of super-alloys; a 2,500-lb. drop-hammer; 250-lb. and 2,500-lb. forging hammers; swaging equipment; and a new reversing, two-stand, rod-rolling mill. The rod mill has been designed for high-speed operation, permitting super-alloys to be formed to final size before they cool significantly from the annealing temperature.

A Sendzimir cold mill for rolling metal foils to thicknesses less than a thousandth of an inch, and a Sendzimir planetary hot mill, one of the first, have also been installed in the new building.

Much of the equipment for metal processing will also be used for the melting, heating and shaping of ceramic materials; but certain ceramic presses, furnaces and other equipment have been installed in separate areas to avoid contamination of the material.

The research staff have available throughout the building compressed air, high- and low-pressure steam, city gas, nitrogen, oxygen, standard hydrogen, dried hydrogen (– 90° C. dew point), rough vacuum, distilled water, cooling water, and hot and cold tap water.

THE TEACHING OF CHEMICAL PRINCIPLES

SECTIONS B (Chemistry) and L (Education) of the British Association held a joint discussion on September 6 on "The Teaching of Chemical Principles in School and University". In connexion with this discussion an exhibition of teaching models and demonstrations was arranged by the Chemistry Departments of the University of Bristol.

Opening the discussion, Prof. D. H. Everett (Bristol) said that in the past twenty or thirty years teachers of chemistry have been faced with new problems reminiscent of those raised at the end of the past century by the advent of physical chemistry. There is, he said, less need now to emphasize the principle that the physical basis of chemistry should form a framework for the teaching of chemistry; instead, the more important questions are concerned with the stage at which modern theoretical ideas—quantization of energy and of radiation; wave mechanics; atomic and molecular orbitals; statistical mechanics and thermodynamics—should be introduced, and with the way in which the abstractions with which they deal can be explained to the uninitiated.

The usual university honours course in chemistry has long since ceased to deal with more than a very small fraction of the total extent of chemical knowledge. However, specialization at an early stage in an honours course, with the object of achieving a detailed coverage of a small part of the subject, is undesirable in itself and obscures from the student the power of the underlying principles to unify the subject. It seems more than ever important that chemical education should not only provide the student with a basic knowledge of the facts of chemistry, but should also develop in him an intuition which will enable him to appreciate the significance of new facts as he meets them. It was argued that there should be a place in the university curriculum for a course in chemical principles which would acquaint the student with the more important features of a wide range of phenomena, and which would show how these are linked by fundamental theory. (An extended essay on this theme is to be found in "The Structure of Physical Chemistry", by Sir Cyril Hinshelwood: the treatment in this book is, however, on a more advanced plane than that foreseen by Prof. Everett.) Some more highly specialized topics would be crowded out of the undergraduate into the postgraduate curriculum, but this is not a serious disadvantage. The understanding derived from a course of this kind is more important than an encyclopædic knowledge of chemical facts.

The physical concepts upon which the principles of chemistry are based are nearly all abstract in nature. The ability to appreciate abstract thought develops slowly, and there are in consequence two opposing views concerning the method of introduction of these ideas. Either they should be deferred until the student is more mature, or they may be introduced early in the university course so that he may have time to understand their value by the end of the course. Because of mathematical difficulties, it is impossible to give a rigorous discussion, and so we must be satisfied with an introductory treatment based on models and analogies, which gives a partial understanding. All such simplifications are, however, half-truths, which if applied incautiously can lead to confusion; but if the models and analogies are carefully chosen, and presented with the right emphasis, the dangers of the 'simple introduction' can be minimized. Some ideas implanted in an early course may have to be rejected later, but the student must be prepared to develop his ideas throughout his training: this evolutionary process is characteristic of the development of science as a whole, and a realization of this fact is important to the student.

Prof. Everett expressed the opinion that many of the fundamental ideas can be explained to students at an early stage in their course (Inter. B.Sc. or first-year degree course) by means of simple mechanical models designed to illustrate macroscopic analogies of the molecular situation rather than to represent the actual atomic or molecular state of affairs. He then demonstrated a series of models illustrating, among other things, the quantization of orbits in the hydrogen atom; absorption and emission of energy in definite quanta; the development of the periodic system of elements in terms of the electronic energy-levels; atomic orbitals; molecular orbitals; the free-energy relationships in an allotropic change, and in the solution of a solid in a liquid. More detailed descriptions of these models will be published in the *Advancement of Science*.

Prof. C. A. Coulson (Oxford) read a paper on the "Teaching of Quantum Mechanics to Chemists". He said that no greater change in chemical understanding has ever taken place in modern times than that associated with the advent of quantum mechanics. As a result, to-day no chemical education is worth considering which fails to take account of this development. Yet quantum theory itself is too wide, and too complicated, to present to chemistry students at a university. For practical purposes it seems as if wave mechanics must bear the effective emphasis. This is, by comparison with other forms of quantum theory, relatively simple, and makes more use of conventional ideas such as probability.

Wave mechanics in chemistry is based on two concepts: the idea of quantization, and the description of electron properties. Neither of these is likely to be obvious, despite the efforts of the popular Press. Hence we seek some simple analogy, or model. These analogies and models seem to be of first-rate importance, since without them there is little or no chance that the student will acquire a 'feel' for these modern interpretations. But they are dangerous, and have often led to serious confusion.

Quantization can be approached via the de Broglie relation and the familiar example of standing waves in a violin string. Electron properties—for the chemist—resolve themselves chiefly into probability distributions (or, more simply, the idea of a charge-cloud) and spin. In the first of these the most important factor to stress is shape. It is unimportant in earlier stages to relate these to magnetic properties. There seems no simple model or analogy for electron spin, and all attempts to provide one seem doomed to cause great confusion later. (Physicists may be able to understand the vector model of an atom, etc., but it is doubtful if chemists should be expected to do so.) A simple version of the Pauli exclusion principle is easily written down, adequate to deal with most ground-states of atoms and molecules, and Hund's rules for incomplete shells can be stated plausibly.

Prof. Coulson expressed the view that every chemist should have some familiarity with wave functions, and suggested that the two lowest-energy states of the hydrogen atom could be worked out by students—this would give confidence that more complete treatments for more complex systems would in fact yield the correct answer.

As an example of the dangers in all elementary accounts, Prof. Coulson cited the frequent misuse of the word 'resonance'. A critique of this concept should be regarded as part of any course on wave mechanics, and leads easily and naturally to a discussion of the true status of wave mechanics, as a most valuable conceptual tool, which gives insight into chemical phenomena, but which is severely limited if accurate *ab initio* calculations are desired. No electronic computer will replace a chemical laboratory.

The third main paper was read by Mr. G. I. Brown (Eton), who gave as the duty of a science master that of understanding the developments in science and interpreting and presenting them in a simplified form to the uninitiated. He considered it important that there should be no undue delay in incorporating new advances into school teaching. This is no easy task for the teacher, and Mr. Brown urged more liaison between active teachers in universities and schools. He welcomed the opportunity for this discussion, also, because it provided a chance of emphasizing the attractions of a teaching career. The teaching of chemistry can be made both interesting and attractive by the variety of possible ways of presenting it, and by the different requirements of students. He stressed that the advanced course of chemistry at school must never be a narrow one, but should give some indication of the importance of all the aspects of chemistry. Each teacher must to some extent decide on the type of approach to be adopted. However, the recent trend towards an undue emphasis on the social and economic aspect was deprecated as one which can too easily give the impression that chemistry is solely concerned with such things as nylon underwear.

Mr. Brown considered that the basis of the course for sixth-form science students should be a theoretical one, involving a study of fundamental chemical principles. Of these the most useful as a unifying framework is modern valency theory. Chemistry is often criticized as a school subject on the grounds that it can be learnt simply by perseverance and hard work, and that it involves too little real thinking. It is true that, below sixth-form level, chemistry cannot fail to be largely a matter of routine learning of apparently unconnected facts—but young boys make no objection to learning the facts, and many have little difficulty in doing so. What is difficult, at this stage, is to exercise the mind of the student in the same way as it is exercised in the learning of, say, mathematics or Latin. There comes a time, usually while still at school, when a boy begins to ask more fundamental questions—and then his mind must be stimulated by something more than a mere catalogue. Mr. Brown expressed his belief that modern valency theory provides the necessary interest, and that despite the criticisms levelled against its introduction in school-teaching, the benefits derived from its use far outweigh the reduction in factual knowledge implied by a change in the balance of study.

Mr. Brown was critical of examining bodies who continue to set questions requiring for their answer the recollection of far too many unimportant facts, and pointed out that the quickest and most effective way of changing the character of school-teaching is to change examination syllabuses and the nature of the examination questions.

The two main contributors to the general discussion which followed were Mr. J. C. Stredder (Tonbridge) and Mr. A. C. Cavell (Uppingham). Mr. Stredder, while not rejecting the incorporation of more recent theories in teaching at school, stressed the dangers of such a policy. He was particularly concerned that an inexperienced pupil, who is unable to criticize—and perhaps unable to understand—the experimental evidence on which modern theories are based, must either allow his critical faculty to be dulled, or must accept such theories as fairy-tales in which he may one day believe. There is a danger that not only facts but also theories will be learned parrot-fashion. Furthermore, the introduction of many modern ideas must depend on the pupil having a sufficient background in physics; and often this cannot be provided adequately at school. Mr. Stredder was of the opinion that, with some exceptions, boys are scarcely ready to be introduced to subjects such as the wave nature of the electron, atomic orbitals, resonance and molecular orbitals until they enter a university.

Mr. Cavell was anxious that developments in chemistry teaching in schools should take account of the educational as well as the more specialized technical aspects. He expressed the view that both schools and universities are attempting to teach too wide a syllabus in science, and that by introducing too much detail, insufficient time is available for dealing with basic principles. While agreeing with Mr. Brown that modern valency theory helps to make sense of chemistry, and encourages thought and discussion, Mr. Cavell said that in his experience the evidence provided by school certificate scripts suggests that either this approach is not being widely used, or that candidates are averse to using it in answering examination questions. His agreement with Prof. Everett that a rational rather than a strictly historical approach is to be preferred, was qualified by the view that one of the fundamental educational weaknesses of science is that it deals more with things than with people. Consequently, he argued, no opportunity should be lost of introducing historical and biographical detail in an attempt to humanize the subject. Mr. Cavell also appealed for closer co-operation between teachers in school and university, especially in connexion with the revision of school syllabuses, the provision of courses for science teachers at universities, and on detailed techniques of science teaching.

PROPERTIES AND DISTRIBUTION PROBLEMS OF RAW COTTON

A ONE-DAY conference on "Raw Cotton, its Properties and Distribution", arranged by the Manchester and District Section of the Textile Institute, was held in Liverpool on November 23 to facilitate the participation of raw-cotton merchants in discussing current problems in the growing and marketing of raw cotton with the spinning and weaving sides of the cotton industry. It was also hoped that the conference would illustrate part of the wide field of activities undertaken by the Textile Institute and so encourage the formation of a Liverpool section. Four papers were presented for consideration and discussion: genetics, by Prof. S. C. Harland (professor of botany in the University of Manchester); cotton quality and its assessment, by E. Lord (British Cotton Industry Research Association); spinners' requirements, by A. Draper (William Birtwistle Allied Mills, Ltd., Preston); and supply and marketing, by W. B. Hutchinson (Major Cleaver and Co., Liverpool).

Partly through necessity, the cotton industry is accustomed to handling variable material, and both marketing and industrial processing are organized to minimize the effects of quality variations. Prof. Harland outlined how large differences between the main groups of commercial cottons are mainly genetical in character, but environmental factors also produce appreciable effects. Variability in the many characters of the fibres in a given cotton sample starts with marked regional variation over the surface of the seed and is progressively increased by additional variation associated with seed to seed, boll to boll and plant to plant differences. Samples of the same strain, but different origin, often show pronounced locality and seasonal effects. Yield is of paramount importance to the grower and so far has received the most attention in the breeding programmes of various research stations. Nevertheless, cotton quality can be improved appreciably by the applications of genetical methods, both by reducing the variability and increasing the average fibre quality. Some past achievements along these lines in various countries were reviewed, and Prof. Harland also pointed out that as yet we are not able to formulate or even envisage the future upper limit that it may be possible to reach by cotton breeding. A valuable development during recent years is the increasing use of spinning tests to measure directly particular yarn features in preference to the previous almost complete dependence on a range of individual fibre tests.

For many years, and still to a large extent, the various features of raw cotton have been appraised commercially by subjective methods, particularly by making assessments based on the visual appreciation of appearance and on tactile impressions noted during manual manipulation of the fibres. A high degree of skill in the classification of cotton quality may come with long experience; but it remains largely a personal matter. Mr. Lord reviewed many of the 'laboratory' methods which have been developed to furnish separate objective evaluations of the various characteristics affecting cotton quality and commented on their accuracy, ease of use, limitations and scope of application. Determination of fibre length may be effected in several ways. In some methods, complete estimation of the several aspects of the distribution of fibre length may be made by tests largely dependent on the skill of the operator. In others, special fibre arrangements may be prepared and measured by the use of photoelectric scanning devices. The cotton fibre is a hollow, flattened and twisted single cell which grows out of the epidermis of the seed. Both perimeter and the degree of wall thickening are of industrial importance; but direct rapid measurement of these features is not generally feasible because of difficulties of technique and the high inter-fibre variation. Tests based on the determination of the weight per unit length and on the microscopical classification of swollen fibres have been developed to furnish indirect estimates of fineness and thickening. These methods have found widespread application, although they are slow in the light of classers' requirements. Measurement of the air permeability of compressed plugs of cotton fibres affords a rapid and reasonably accurate method of assessing specific fibre surface. The specific surface is determined both by the fibre fineness and the cell-wall thickening, and hence the practical interpretation of flow estimates demands care. Fibre strength is of prime technical importance and is most easily measured on bundles of parallel fibres. The structure and growth of cotton are such that weak places occur at irregular intervals along each fibre, and this leads to a marked dependence of measured fibre strength on the length of test specimen, so that no single set of experimental conditions affords a means of fully assessing the separate strength characteristics. Cotton 'grade' was another feature briefly reviewed at the conference. The 'Shirley' analyser is a mechanical tester for the determination of the trash or foreign content of cotton, one quantity largely influencing the classified grade. The assessment of particular reflectance characteristics of cotton may be made on the automatic Nickerson–Hunter cotton colorimeter. Observations on this instrument correlate well with the visual grade classifications of American cotton. Commercial applications of the colorimeter are limited by the price, but its use in maintaining a regular check on the choice and formation of physical standards of grade is now established in the United States and should prove valuable in avoiding small but progressive changes which have occurred in the past.

Mr. Draper commented further on the application of fibre and spinning test methods to the choice and classification of raw cotton. Most objective tests are still too lengthy to permit their being applied to all commercial samples. Nevertheless, there is a strong need for representative scientific data to be available to the grower, merchant and spinner in order to encourage the production of more suitable material and to detect quickly those growths in which deterioration is occurring. He felt that in some instances the side of the industry concerned with growing might have exploited scientific tests to indicate how closely quality can be cut without incurring undue complaint instead of exploring more fully the possibilities of developing new strains of better general quality or with specialized characteristics for competing or blending with man-made fibres. Mr. Draper also outlined in detail some of the ways in which practices of merchanting raw cotton in Great Britain might usefully be extended in order to meet more satisfactorily the requirements of the spinner.

Mr. Hutchinson surveyed the basic principles of the organization of cotton marketing. The present pattern in Britain has been gradually developed to fill many varied needs. It must provide a selling link between the small grower and the consumer and maintain classification methods to ensure reasonable continuity in quality despite regional and seasonal fluctuations. Marketing organization on a wide scale requires a complex price-structure to cope with rapidly changing supply and demand, with intermittent government interference through monetary controls and crop limitations, and with the problems arising through price changes during the often lengthy period which elapses between harvesting the crop and the final production of textile articles. The use of scientific tests to determine cotton quality is a development of significance which cannot be ignored. Merchants must examine these methods and place them in proper perspective in the general framework of trading. Stress was laid by Mr. Hutchinson on the need for merchants and also spinners to have the fullest information available about the various characteristics of both main growths and new varieties. He said that at first it would probably be found better to superimpose any new tests on the established systems of classifications than to set up new systems. Nevertheless, marked additional sub-classification would certainly give rise to serious marketing difficulties. Selling would be made more complicated because many test results cannot be used as a basis for trading values, choice of material might be more restricted, and prices would be increased by higher classification costs, while adequate cover against price changes could not be arranged to cope with a multiplicity of qualities. There might be more scope for the use of scientific tests in normal 'spot' trading of cotton for immediate consumption than in 'futures' trading for covering price changes.

SYMPOSIUM ON THIOCTIC ACID

A SYMPOSIUM on the chemistry, biochemistry and pharmacology of thioctic acid was held during November 28 and 29 at the Institute of Pharmacology of the University of Naples. There were about a hundred participants, including Profs. Bovet, Chain, Condorelli and Rossi-Fanelli (Rome), Prof. Theorell (Stockholm) and Prof. Vannotti (Lausanne), apart from the speakers.

The symposium was introduced by Prof. D. Marotta, director of the Istituto Superiore di Sanità (Rome), and the first lecture was given by Prof. M. Calvin (California), who discussed the part played by thioctic acid in the photosynthetic cycle. Prof. Calvin reported the isolation, with the help of ^{35}S-labelled thioctic acid, of the natural active form from the plastids of algae. It is probable that, in this form, the carboxyl group of thioctic acid is bound in an ester linkage to a hydroxyl group of glycerol.

Prof. E. A. Braude (London) followed with an account of the synthesis of thioctic acid. He described a new method which affords a good overall yield in few steps and represents the first application of the Prins reaction (addition of formaldehyde to an olefin) to the synthesis of a natural product.

The pharmacology of thioctic acid was discussed in a lecture by Prof. L. Donatelli, who stated that the lethal dose in rabbits, mice and other animals lies between 100 and 220 ml. per kgm. weight. A strong antitoxic action of thioctic acid was demonstrated for acute and chronic poisoning by mercuric chloride, arsenite, arsenobenzoles, carbon tetrachloride, aniline and *iso*nicotinic acid hydrazide. A remarkable diuretic and choleretic effect was also observed in the rabbit.

The second day was devoted to the physiopathology and therapeutic applications of thioctic acid. Prof. P. Larizza (Cagliari) reviewed present knowledge on the part played by thioctic acid in biochemical processes and illustrated his experiments on phosphorus poisoning and steathogenic (Handler) diets in which thioctic acid normalizes the fat content of the liver. Prof. F. Rausch (Bad Rothenfelde) reported on the applications in human pathology, particularly in the awakening action on liver coma patients. This effect was confirmed by Prof. A. Colarusso (Naples), who also discussed the liver-protecting action in hepatic cirrhosis and various forms of hepatitis. He noticed a remarkable diuretic effect on some of his patients with liver cirrhosis and congestive heart failure. The dose used was of the order of 20–50 mgm. per day, usually injected intravenously.

From these lectures and from the lively discussion which followed, it was clear that thioctic acid, apart from playing an important part in plant metabolism, may be a useful therapeutic agent, especially in diseases of the liver.

A. Segre

WATER RESOURCES OF GREAT BRITAIN

ALONG with the news of the reconstitution of the Central Advisory Water Committee (*Nature*, October 22) comes the welcome reappearance of "The Surface Water Year Book of Great Britain"*. A complete survey of inland water resources involves details of rainfall, surface water and ground water. The "Year Book" provides information about the surface water resources of most drainage areas and their rainfalls, and rather more detailed information relating to rainfall alone is issued annually in "British Rainfall", published by the Meteorological Office. Details of ground water resources are not yet available, but active steps are being taken to acquire and issue this information.

The first three "Surface Water" volumes dealt with the periods 1935–36, 1936–37 and 1937–45, and the fourth and present volume with the eight water years 1945–53. In the first two volumes the measurements reported were collected from various public and private organizations, and the distribution of the records was very uneven. This was improved in the third volume, and a further notable increased coverage occurs in the fourth volume largely as a result of the River Boards Act of 1948.

In the present volume Great Britain is divided into 103 areas, each area corresponding to one or more river basins. Within each area there is, first, a general description of the region, the gauging stations and the records available. Monthly evaluations of the average general rainfall over the drainage area for the standard period 1881–1915 are given, and then follow tables of monthly discharges and run-off, together with monthly evaluations of the general rainfall. An indication of extreme discharges is also given.

Thus the presentation of the data, so far as the monthly flow records are concerned, closely follows the pattern of the third volume, but the new volume does not give daily discharges for each station or the tables of frequencies. The possible inclusion of these data and other relevant information is, however, under consideration for the next issue, which it is hoped will cover only one water year. Meanwhile, the issue of the fourth volume is a notable step towards the systematic collection and dissemination of the basic data necessary for the formulation of a much-needed national water policy in Great Britain.

SCIENCE IN THE UNITED STATES DURING 1954

THE third report of the British Commonwealth Scientific Office in Washington, D.C., entitled "Notes on Science in U.S.A., 1954"*, covers 1954 and is not so specifically linked with the United States fiscal year as the two previous reports. During the period under review, the only legislative activity directly affecting science was the passing of the new Atomic Energy Act, which permits an increased release of information on atomic energy to American industry and exchanges with other countries. While the possibilities of exchanging military-type information are limited, there is wide scope for co-operation on the peaceful uses of nuclear energy. The five-year nuclear power programme of the Atomic Energy Commission, which was approved in March 1954, calls for research and development at a cost of 8·5 million dollars a year and a total estimated expenditure of 199 million dollars on five specific projects on reactors of the following type: pressurized water; sodium graphite; boiling water; homogeneous; and fast breeder. Besides this, the United States Navy has expanded its programme of nuclear-powered vessels, and the Air Force is developing nuclear-powered aircraft. For the Army, a power plant, the so-called Army Package Power Reactor, is being constructed; this will develop about 2,000 kW. of electricity, and the components will be transportable by air. The Commission has replaced the previous 'study' agreements with industry by three types of participation agreements, and it was estimated that perhaps a hundred new participating agreements would be signed in 1955 in addition to the twenty study agreements by the end of 1954. In the field of particle accelerators the Commission has approved the design and construction at the Brookhaven National Laboratory of an ultra-high-energy alternating-gradient synchrotron for producing beams of protons of energies ranging up to 25,000 MeV. The value to industry of radioisotopes is now estimated at a hundred million dollars a year, and that of the ancillary industry of making instruments for the detection of radiation is expected to reach thirty-five million dollars a year by 1956. The Commission is constructing a new 200,000-dollar plant for processing radioiodine and has made available to industry the irradiation facilities of the high-intensity 30,000-kW. Materials Testing Reactor at Arco, Idaho, while a 90,000 dollar gamma-radiation plant is being constructed at Argonne primarily for use by the Army in studying food preservation. A note on nuclear developments in Canada directs attention to the valuable information which has been gained in restoring the 30,000 kW. reactor at Chalk River (called NRX). The reactor is now operating at 40,000 kW., and this greater power will reduce the time for research experiments and the production of isotopes, as well as permit tests on components for the new reactor to be made under irradiation more nearly comparable with actual conditions of exposure.

Referring to the President's Executive Order of March 1954, reiterating his support for the National Science Foundation, the report points out that the Order is important as indicating the Administration's intention that the Foundation shall be the cornerstone of the basic research effort of the United States. Federal expenditure on research and development in 1954 is estimated at 2,095 million dollars, or 3·1 per cent of the total budget, and roughly half the national expenditure on research and development. Of this, 1,530 million dollars went to the Department of Defense, and, including all the work of the Atomic Energy Commission and of the Advisory Committee for Aeronautics, the proportion concerned with defence was 90 per cent. About 250 million dollars was spent on new facilities and equipment. In view of the complexities of the relation between the National Academy of Sciences and the National Research Council and of the slight understanding of those outside the United States of the relation of the Academy to the Government, the functions of both bodies are explained at some length. During 1952–53 about three-quarters of their income of 6 million dollars came from government contracts and grants.

Academic research on solid fuels was reduced in volume during the year; but in view of the state of the coal industry a programme to develop new, and maintain existing, markets for coal has been initiated. A joint survey of the comparative economics of the electric furnace and the open-hearth furnace for the production of low-carbon steel indicated substantial advantages for the electric furnace; but a complete change-over to electric furnaces would require a 12 per cent increase in the output of electricity and 25 million tons a year increase in coal consumption. In the new programme on synthetic liquid fuels emphasis has been placed on catalyst development, while in coal hydrogenation the aim is a one-stage high-pressure process giving high yields of gasoline; the chemistry and physics of the processes are receiving more fundamental study. Little further work on the gasification of coal at atmospheric pressure is contemplated, but construction of an improved pressure-gasifier at the new research station at Morgantown continued; this may permit a two-thirds reduction in the cost of compressing synthesis gas before its use in methyl alcohol, ammonia or Fischer–Tropsch synthesis. The possibility of transporting liquid methane in ships containing tanks internally insulated by a thick layer of cemented balsa wood sections is being examined, and increasing attention is being given to atmospheric pollution, on which ninety-eight laboratories in the United States were working during 1953. In the Detroit (Michigan)–Windsor (Ontario) area an International Air Pollution Study is in progress in which an international technical advisory board co-ordinates the activities of both United States and Canadian authorities, and co-operation has also been secured in attempts to reduce smoke emitted by vessels plying the Detroit River.

Interest in solar energy is expanding, and at a conference at Madison, Wisconsin, in June 1953 graphical methods were demonstrated for analysing the economics of collector design; the basic mechanism of photosynthesis was discussed from the point of view of quantum mechanics and thermodynamics, and of photolytically induced endothermal chemical reactions, while the Bell Telephone Co., Inc., has announced a photoelectronic cell consisting of a very thin plate of metallic silicon yielding, in full sunlight, power at the rate of about 50 watts per sq. yd. The mass culture of algae is also receiving much attention, and a feature of a symposium at the Boston meeting in December 1953 of the American Association for the Advancement of Science was the disclosure that much of the present work is with algae other than *Chlorella*.

Although water is an abundant resource in the United States, it can no longer be taken for granted, and the rapid increase in the use of ground water for air conditioning appears to be causing concern; but there appear to be insufficient data on water losses in all phases of the cycle of water supply and use. Active work continues on the desalting of water; but nothing yet published suggests that provision of irrigation water in quantity by this method is approaching economic possibility. In agriculture the main development during the year, especially in the western States, was the use of liquid fertilizers. Several nitrogenous solutions are on the market, and other solutions, containing nitrogen, phosphates and potash, are available for use with low-pressure spraying equipment or for insertion into irrigation water. As regards insecticides the present trend is to concentrate on substances which can be absorbed into the plant system and, by their presence in the plant cells, prevent attack by insects or infection by disease. Growth-regulating substances are being used not only for removing unwanted plants but also for controlling the rate of development of ornamental shrubs, to delay the flowering of fruit trees, and even to retard the growth of lawn grass. In animal production, the main developments on the nutrition side have been the use of antibiotics to accelerate the fattening of cattle, and the evolution of a system by which pigs can be weaned at five days old. In 1952, about 30 per cent by weight of all antibiotics produced in the United States was fed to farm animals. Further developments by industrial interests and by the official research centres during 1953 and the first half of 1954 may well make 1954 the last 'experimental' year in regard to the full-scale commercial production in the Americas of kenaf, the jute substitute. The problem of mechanical harvesting has not been solved, however, but chemical retting may go far to place the industry in a strong position.

In metals and metal physics, work on the sintering of iron ores has received considerable impetus, and many trials have been made with a high proportion of sinter in the burden. Attention is being given to the development of domestic sources of supply of titanium, and a new plant, with an annual output of a hundred thousand tons of ilmenite, is under construction in Florida; it is of the 'travelling lake' type and uses a battery of Humphrey spirals on a raft which floats in a lake of its own making and proceeds through the deposit as ore is taken in at the front of the raft and waste material discharged at the rear. Several firms have been working on the casting of titanium and titanium alloys, and the major difficulty of surface contamination appears to have been overcome. The potentialities of the Colorado Plateau as a source of uranium were emphasized during the year, and the release of the classified metallurgical work on beryllium has permitted a comprehensive view of the present state of beryllium metallurgy in the United States. Satisfactory methods are now available for the metallographic examination of beryllium and its alloys; but, apart from an aluminium casting, no beryllium-rich alloy is known to be in use, although beryllium might find extensive use in reactors if the cost were reduced to 25 dollars/lb. of pure beryllium raw metal. In fundamental research, much work is being done on single-crystal specimens, whereby grain-boundary effects and some other variables are eliminated. Interest is widespread in the development of chemical methods for the extraction of metals, in place of normal smelting procedures, to which low-grade ores, tailings and slags are often not amenable, and considerable attention has been paid to low-grade domestic sources of manganese, as well as to the extraction of copper, nickel, cobalt and uranium from low-grade ores. In 1953 the sale of synthetic detergents in the United States exceeded for the first time that of soap, and this increasing use is presenting problems of sewage disposal and water supply, particularly the growing use of non-ionic materials, which now account for 10 per cent of the production. There is also evidence that detergents may have a deleterious effect on the sewage-digesting bacteria.

Several research groups are considering the possibilities of mechanical aids to translation, and a feature of this report is a brief but excellent bibliography of recent articles and reports.

DETECTION OF ATMOSPHERIC DUST AND TEMPERATURE INVERSIONS BY TWILIGHT SCATTERING

By DR. E. K. BIGG

Division of Radiophysics, Commonwealth Scientific and Industrial Research Organization, Sydney

THE detection of meteoritic dust and the tracing of its passage through the atmosphere is important in view of the evidence produced by Bowen[1] that rainfall (when added for many stations or many years) is correlated with the advent of meteor showers. Discontinuities in the scattered sunlight during twilight have been reported by Grandmontagne[2] and de Vaucouleurs[3], and the hope of displaying these more prominently and perhaps identifying them with regions of dust led to the experiments to be described.

During twilight, light received from a cone of 1° vertical angle was recorded by a photocell with filter at the focus of a large lens. The light was interrupted 250 times per sec. by a rotating slotted disk, and the alternating current from the photocell amplified and balanced against a fixed voltage, the difference between the fixed and varying voltages being read at 10-sec. intervals. Whenever the difference reached a certain level, it was reduced to zero by adjusting the gain of the amplifier. The rate of change of the deflexion of this meter was then approximately proportional to the ratio of the rate of change of illumination (dI/dt) to the illumination (I).

To emphasize the contribution of dust particles to the scattered light, the large forward scattering of particles comparable in size with the wave-length was utilized by looking in the vertical plane containing the sun at an angle of 20° to the horizon. Height was defined by the intersection of the grazing ray from the sun's centre with the line of sight, with a fixed allowance of 68′ for refraction. To make the shadow as sharp as possible, only light of red and infra-red wave-lengths was accepted by the equipment.

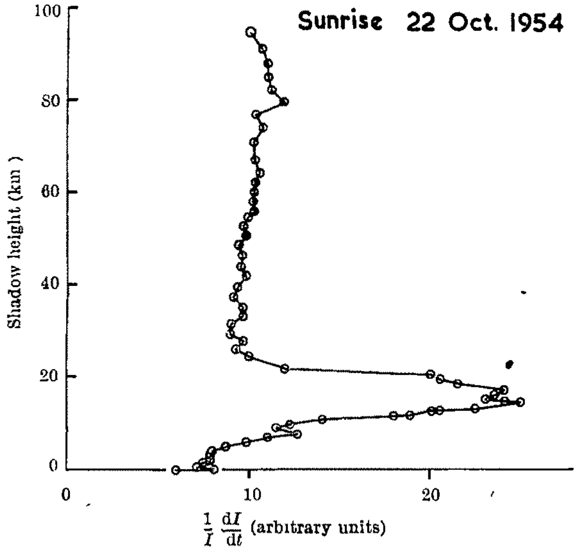

Fig. 1

The present results were obtained during October 19–November 30, 1954, near Alice Springs (lat. 23° S.) in Central Australia, a dry, cloudless climate being essential for the experiments. There was a nearby radio-sonde station from which temperature soundings were made daily shortly after noon. A fuller description of the observations at this and two other sites has been submitted for publication to the *Journal of Meteorology*.

Scattered light was detected for shadow heights exceeding 100 km., but was not recorded because of the high proportion of secondary scattering. Regular features of the twilight curve of $\frac{1}{I}\frac{dI}{dt}$ were a large maximum near 15 km., a long constant portion and second maximum near 80 km., the relative sizes in arbitrary units being 15–50, 10, 10–13 respectively. A typical example is shown in Fig. 1.

A specific example serves to illustrate the nature of the lower maximum. In Fig. 2 is shown a temperature sounding showing inversions *A–E* and the following twilight curve with maxima *A′–E′*. The interpretation of the similarity is that a maximum of $\frac{1}{I}\frac{dI}{dt}$ occurs at the boundary of regions of different dust content—a boundary usually being a temperature inversion. In cases where the only inversion was the tropopause, the peak in $\frac{1}{I}\frac{dI}{dt}$ was also usually single, and the heights of the tropopause and the peak varied from day to day in a similar way. The size of the largest maximum in the twilight curve varied greatly and was correlated remarkably with surface pressure 60 hr. later. This is thought to mean that instability in advance of cyclonic conditions led to upward transport of dust which accumulated at the tropopause. The possibility of detection of meteoritic dust by the twilight method at this level is therefore slight, because of the relatively large quantities of dust of terrestrial origin.

The long part of $\frac{1}{I}\frac{dI}{dt}$ between 25 and 75 km. was, on the average, constant but contained some short-lived irregularities which had usually disappeared by the following twilight. If these represented falling dust layers, the inference is that the dust was patchy or soon mixed vertically.

The maximum in the curve near 80 km., although smaller than that at the tropopause, was of great interest as it seemed likely to be associated with the temperature inversion known to exist there. Calculations indicate that molecular scattering alone is

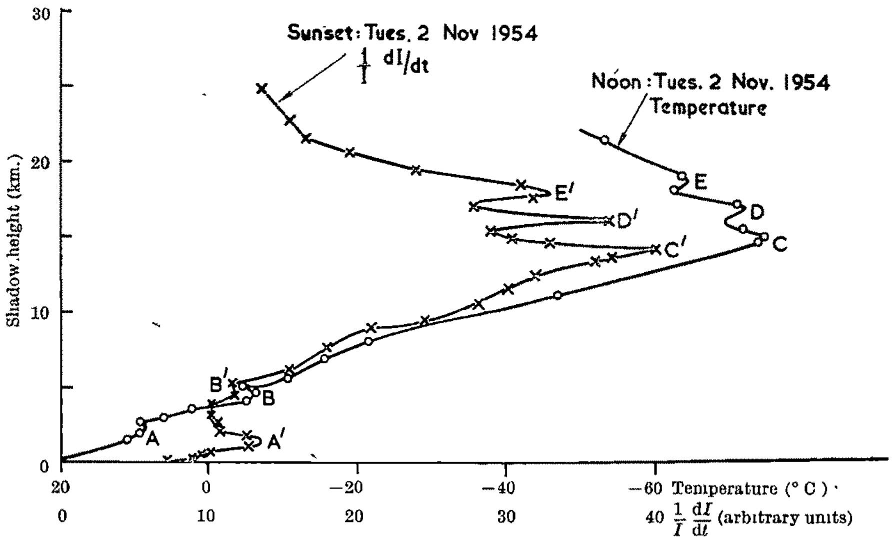

Fig. 2

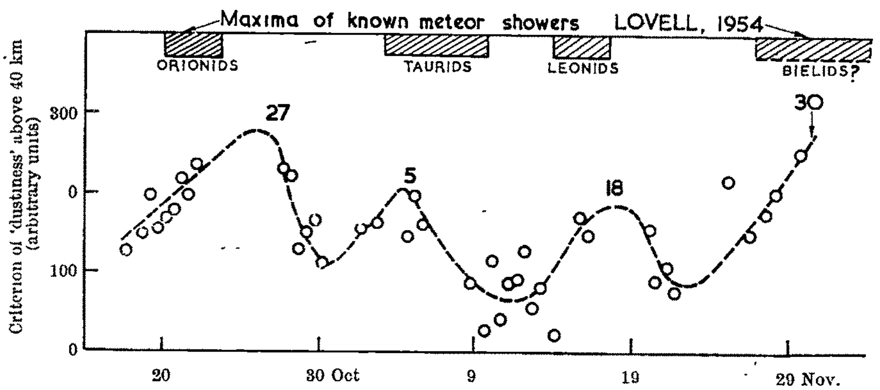

Fig. 3

unlikely to account for the day-to-day variations found at this height, so that they are due, at least partly, to scattering from larger particles. The area under each curve was therefore integrated between 90 km. and 40 km. to obtain an arbitrary criterion of 'dustiness' in the upper atmosphere, and it was found that some systematic variations existed. These are shown in Fig. 3, and it can be seen that, in spite of scatter, there seems to be a tendency to maximum values at about the time of maximum of meteor showers.

Because the meteor showers of this period have relatively broad and ill-defined maxima, they are not well suited to test Bowen's theory of the meteoritic influence on rainfall. The maxima shown in Fig. 3, though somewhat subjective, provide fairly definite dates which can be used to check the 30-day lag which Bowen found between the advent of the meteoric dust in the atmosphere and the associated rainfall peak. A compilation of fifty years rainfall from about 250 stations for this period, prepared by Bowen (private communication), has maxima on November 27, December 5 and December 29—each about thirty days after high values of 'dustiness'.

The average height of the upper maximum in the twilight scattering curve, which is believed to be associated with the temperature inversion at about that height, was found to be 81·1 km. for the thirty-two occasions in this period when it was well defined, the extreme variability being ±5 km. An interesting feature of the scattering near 80 km. was the formation of a double maximum, which occurred on days near the peaks in Fig. 3.

The experiments described offer a novel method for detecting inversions in the troposphere and for studying the height and form of the discontinuity near 80 km. The observations so far made are consistent with Bowen's rainfall–meteor dust hypothesis, but provide no conclusive evidence to support it. [July 28

STRUCTURES AND FUNCTIONS OF THE PHENOLASE COMPLEX

By Dr. H. S. MASON

Department of Biochemistry, University of Oregon Medical School, Portland, Oregon

THE phenolase complex, widely distributed throughout the phylogenetic scale, consists of two enzymic activities, phenol *o*-hydroxylase ('cresolase', equation 1) and *o*-diphenol dehydrogenase ('catecholase', equation 2). These activities have

$$\text{Monophenol} + \tfrac{1}{2}O_2 = o\text{-diphenol} \qquad (1)$$

$$o\text{-Diphenol} + \tfrac{1}{2}O_2 = o\text{-quinone} + H_2O \qquad (2)$$

now been investigated for sixty years[1], and from the results which have been obtained, two interesting problems have emerged: What is the chemical basis of cresolase activity? And what is the relationship between cresolase and catecholase activity? In this communication I propose to develop a new theory of the mechanism of reactions catalysed by the phenolase complex, a theory which appears to give the most plausible solution of these two problems.

The catalytic activities comprising the phenolase complex possess the following characteristics: (*a*) they occur together[2,3], and have been found associated with the same electrophoretic and ultra-centrifugal component[4]; (*b*) in any preparation of the phenolase complex, they are inhibited to the same degree by metal-binding reagents, and substrates for one activity competitively inhibit the other[5–8]; (*c*) each activity has been found proportional to copper content[4,7–9]; (*d*) both activities are lost when copper is removed from holoenzymic preparations and reconstituted when copper is added to the inactive apoenzymic product[8,10]. Furthermore, it has not been possible to remove catecholase from cresolase activity[4,7,10–12].

While the two reactions catalysed by the phenolase complex are very dissimilar, the corresponding enzymes appear to be associated with the same active site. Since the catalysis of two types of reaction by a single catalytic configuration is a situation rare in biochemistry, the possibility of its occurrence deserves close scrutiny. Thus, it has not been possible to remove catecholase activity from cresolase, but considerable purification of catecholases themselves has been achieved[4,7,8]. During these purifications the cresolase activity is, however, destroyed rather than separated, and the ratio of the two activities in the phenolase complex can readily be altered by mild physical treatment, such as warming or adsorption, or even standing at −72° in lyophilized form. In addition, the residual cresolase in high catecholase preparations has a characteristic lag or induction period toward monophenolic substrates which is absent in crude extracts and is specifically abolished by traces of *o*-diphenolic substrates for catecholase[7,8,13]. A quantitative (inverse) relationship exists between the concentration of this *o*-diphenol and the length of the induction period[13]. Non-specific shortening of the induction period also takes place in the presence of reducing agents such as ascorbic acid and hydroquinone, which are not themselves *catalytically* oxidized by the phenolase complex[6,14].

Mechanism of Cresolase Action

A number of mechanisms have been proposed to explain these observations. The reader is referred to recent review articles for historical and bibliographic details concerning them[2,3,15]. For the present purposes, it is sufficient to recall that these hypotheses fall into enzymic and non-enzymic classes. According to the latter concept, the quinonoid product of the catecholase reaction (equation 1) is an active oxidant in the cresolase reaction, in the sense shown by equation 3:

$$\text{Monophenol} + o\text{-quinone} + H_2O = 2\ o\text{-diphenol} \qquad (3)$$

Molecular oxygen is thus consumed only to form *o*-quinone, and the oxygen of the freshly introduced hydroxyl group must arise from solvent water. In order to test this theory and to learn more of the mechanism of cresolase action, we have recently conducted the hydroxylation (of 3,4-dimethylphenol) in environments of oxygen-18 and water, and oxygen and heavy water ($H_2{}^{18}O$), and have determined the heavy-oxygen content of the 4,5-dimethylcatechol which was formed in each case[16]. The results are given in Table 1. Clearly, the oxygen of the newly introduced hydroxyl group arises from molecular oxygen. None comes from solvent water, nor is there any apparent exchange of solvent oxygen with molecular oxygen during the process. It is therefore certain that the mechanism described by equation 3 cannot operate during cresolase action. This is quite consistent with a number of other observations which make a non-enzymic basis for cresolase activity unlikely, such as the ortho-position and optical specificities of cresolase[10,13,14], the inability of quinones generated by other enzymes to hydroxylate monophenols[11,17], the high level of cresolase activity possible in the presence of strong reducing agents[6], and the changing ratios of cresolase to catecholase activity during purification[4].

Table 1. Uptake of Oxygen-18 from Oxygen-18 and from $H_2{}^{18}O$ during the Enzymic Hydroxylation of 3,4-Dimethylphenol in the Presence of Mushroom Phenolase

Experiment	Per cent of theoretically possible uptake of oxygen-18
1. ${}^{18}O_2 + H_2O$	89 88, 95
2. $O_2 + H_2{}^{18}O$	0, 0

Since, therefore, cresolase activity is an enzymic rather than a non-enzymic process, molecular oxygen must combine at some stage with enzyme or enzyme-substrate complex. There is a growing consensus of opinion[4,6,15,17–19], to which I subscribe, that the *o*-diphenol-sensitive induction period of cresolase, the changing ratios of activities and the dependence of both activities upon a copper-containing protein can best be explained in terms of a single enzyme possessing two characteristic activities. In the form proposed by Dawson and his co-workers[4], this hypothesis provides that, during the oxidation of an *o*-diphenol by the phenolase complex, a portion of the enzyme becomes momentarily activated or primed, so that it can bring about the hydroxylation of monophenols. It is for this reason that the enzyme is cresolase-active when simultaneously oxidizing *o*-diphenols[6,20,21–24]. The changing ratios of cresolase to catecholase activity during purification of the phenolase complex are ascribed to fragmentation of the phenolase complex, and to loss of copper-free portions of the enzyme which must in some way be important to cresolase activity. The molecular sizes of different preparations are thus different, but the number of copper atoms per molecule (four) presumably remains constant. Since copper forms only a portion of the cresolase-active centre according to this concept, only the catecholase activity should be proportional to the copper content of high catecholase preparations, and this is indeed the case. However, the terms 'priming', 'activation', and 'fragmentation' are vague and their physico-chemical basis is ambiguous; considering that it has not been possible to obtain cresolase preparations sufficiently homogeneous.

On the other hand, evidence concerning the number and valence of the copper atoms at the catalytic sites of the phenolase complex together with the results of the oxygen tracer study make it possible to offer a more plausible explanation of the mechanism of catecholase and cresolase reactions catalysed by the same copper protein (phenolase). Thus, in the presence of one molecule of *o*-diphenol, two cupric atoms in phenolase are reduced to cuprous atoms[8]. Since hydroxylation by phenolase cannot take place in the absence of *o*-diphenols[13,21–24] or other reducing agents[6,14,20], cresolase activity has its initial basis in reduced phenolase, that is, cuprous enzyme. *o*-Diphenols act as the heat-stable substances which Keilin and Mann[7] have suggested as a requirement for cresolase activity, and thus have a dual function as specific cresolase activators and as catecholase substrates. Furthermore, one molecule of carbon monoxide is bound per two atoms of cuprous phenolase copper[8]. It is therefore likely that the catalytic configuration involved in cresolase activity consists in two neighbouring cuprous atoms attached to protein, and that one molecule of oxygen may combine with this structure, which accordingly bears a strong analogy to that of hæmocyanin[8,25,26]. Differences in the mode of attachment of copper to protein which lead to a different distribution of electrons around the oxygenated complex may account for the reversible coupling of molecular oxygen by hæmocyanin on one hand, and hydroxylation of the benzene ring by phenolase on the other. On these grounds, the mechanism of cresolase action may be expressed by equations 4, 5 and 6. One atom of oxygen is consumed by the hydroxylation reaction during this sequence. The second atom is reduced to water, a process which requires two electrons. Two cuprous atoms supply them, and at the end of the hydroxylative phase (equation 5) this pair must then be in the cupric or inactive state, and require reactivation by the oxidation of *o*-diphenol, as depicted in equation 7. It also seems probable that steps 5, 6, and 7 occur in one stage, as shown in equation 8, the phenolic substrate displacing a water of hydration at the copper to form an activated ternary complex, which dissociates directly to *o*-quinone.

$$\text{Protein}-\text{Cu}^{+}{}_2+\text{O}_2 = \text{protein}-\text{Cu}_2-\text{O}_2 \tag{4}$$

$$\text{Protein}-\text{Cu}_2-\text{O}_2+\text{monophenol}+2\text{H}^+ = \text{Protein}-\text{Cu}^{++}{}_2+o\text{-diphenol}+\text{H}_2\text{O} \tag{5}$$

$$\text{Protein}-\text{Cu}^{++}{}_2-+2e^- = \text{protein}-\text{Cu}^{+}{}_2 \tag{6}$$

$$\text{Protein}-\text{Cu}^{++}{}_2+o\text{-diphenol} = \text{protein}-\text{Cu}^{+}{}_2+o\text{-quinone}+2\text{H}^+ \tag{7}$$

$$\text{Protein}-\text{Cu}_2-\text{O}_2+\text{monophenol}\} = \text{protein}-\text{Cu}^{+}{}_2+o\text{-quinone}+\text{H}_2\text{O} \tag{8}$$

This hypothesis explains the close association of catecholase with cresolase activity, and also provides a basis for the facile loss of cresolase activity during purification. The power of the oxygen complex, which we postulate as the cresolase-active site, to act as a locus of hydroxylation must depend upon the orientation of the electrons around the complex, and this in turn must depend upon the positions of the copper atoms relative to one another. Since the relevant valence states and bond angles are unknown, little can be said about this structure beyond the possibility that it may take one of the forms illustrated in Fig. 1, in which the positions of the copper atoms in the complex have been estimated from the structure of hydrogen peroxide[27]. Of the three configurations shown, one cis (*A*), one trans (*B*), and one containing a co-ordinated oxygen atom (*C*), the last is preferred for its asymmetry, which suggests a straightforward hydroxylation mechanism involving interaction of the oxygen atom with pi-electrons of the benzene ring. A change in the relative positions of, and the distance between, these two atoms of copper (3, 4, or 5 A.) must result not only in a change of oxygen-binding power but also of hydroxylating power, which will

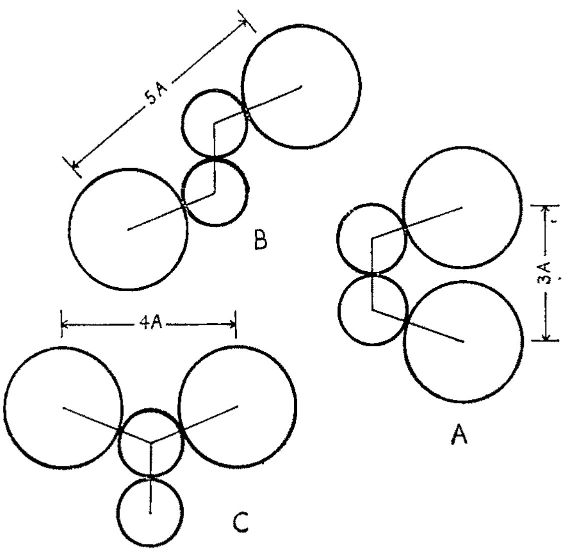

Fig. 1. Scale drawings depicting possible configurations of the cresolase-active copper–oxygen complex. The large circles represent copper atoms, the small circles, oxygen

therefore be sensitive to any small twist or spread of the protein backbone or amino-acid side-chains involved in the attachment of copper.

We designate this fixed, cresolase-active configuration 'closed phenolase'. Active enzymic sites which have been altered in respect to the positions of the copper atoms as a result of either physical or chemical influences we designate 'open phenolase'. The structural configuration of such a site may still exhibit much of its specificity towards substrate phenols, but may contain only one atom of copper either as a result of separation or loss of a mobile or loosely bound member of the pair. Since copper atoms attached to non-specific protein display pseudo-catecholase activity[28,29], there is no *a priori* reason for believing that the open configuration should have less catecholase activity than the closed structure. The ease with which the closed configuration is transformed into the open during purification may vary with the protein and its associated copper bonds, which are apparently of low stability in mushroom phenolase, of intermediate stability in potato phenolase, and are stable or protected in highly organized macrostructures such as mammalian melanin granules. The stability of cresolase activity must therefore bear a relationship to the characteristics of the aggregate upon which it occurs. Because of this sensitivity toward environmental changes, cresolase activity has resisted purification, and high-cresolase preparations resemble original extracts and differ from high-catecholase preparations in respect to solubility, copper content, behaviour towards adsorbents, and isoelectric *p*H, as well as in enzymic character.

Structure and Function

Elsewhere, oxygen transfer and electron transport by the phenolase complex have been related to the formation of the *o*-diphenolic precursors of the flavonoids, lignins, cuticulation diphenols of arthropods, etc.[30]. Although students of plant respiration have tended to lay emphasis on the catecholase aspect of the function of the phenolase complex, it follows from the present hypothesis that preparations of the high-catecholase type may be artificial in the sense that they bear a catalytic configuration which is produced in the process of isolation of the enzyme and which differs from that of the enzyme present within the cell. The high-cresolase (closed) form is the more nearly natural state of the enzyme. In this state a prevailing oxidation potential sufficiently high to keep the enzyme in the cupric form will prevent hydroxylation even in the presence of appropriate substrate and oxygen, but this inhibited phenolase complex may be activated by reduction. Thus, closed phenolase may occur *in vivo* as a reduced enzyme active towards both mono- and di-phenols, or as an oxidized form inert but activatable towards monophenols although already active towards *o*-diphenols. The open phenolase which is produced as a result of processes of purification is active towards *o*-diphenols but relatively inactive towards monophenols, which may act as substrate only owing to the residual closed form present in the enzyme preparation.

Finally, it is interesting to observe that the two series of metalloproteins involving hæm on one hand and copper on the other have striking similarities in their range of function. Each series contains an oxygen carrier dependent upon reduced metal (hæmoglobin and hæmocyanin), an electron carrier (cytochrome and catecholase), and an oxidizing enzyme (peroxidase and cresolase)

Measurements of Natural Freezing Nuclei at High Altitudes

A NUMBER of determinations of freezing nuclei has been made in aircraft. These form part of a programme of investigation into (*a*) the distribution and properties of freezing nuclei at high altitudes (where they are thought to play a part in the formation of rain by the Bergeron process), and (*b*) the question of whether the rainfall singularities reported by Bowen[1], and attributed by him to the arrival in the lower atmosphere of meteoritic dust, are accompanied by corresponding fluctuations in the concentration of freezing nuclei. Daily measurements were made near Sydney, Australia, during January 1954 and January 1955, and near Tucson, Arizona, United States, in January 1955. In addition, in January 1955 measurements using a somewhat similar method were carried out on a mountain top in the Hawaiian Islands. The results to date are summarized below. The month of January was chosen because the meteor dust – rainfall hypothesis was based on statistics for that month.

The airborne measurements at Sydney and Tucson were carried out as described by Smith and Heffernan[2], using cold chambers of 100-litres capacity. These were filled with air from outside the aircraft and cooled at 4 deg. C. per min., water vapour being added to form a fog. The concentration of ice crystals was observed at various temperatures, the threshold of detection being 0·1 crystal per litre. Samples were taken at various altitudes, but in this communication only results at altitudes exceeding 3,000 metres are given. On some days, two readings at the same altitude were made, and the mean is given.

Fig. 1 shows the daily variation in the warmest temperature at which one ice crystal per litre was observed, the three curves representing Sydney 1954 (full), Sydney 1955 (dashed) and Tucson 1955 (dotted). It can be seen that in both years this temperature varied markedly at Sydney, but much less at Tucson. The consistency of several readings on the same day is such that, while the temperature variation recorded at Tucson may not be significant, that recorded at Sydney is. If similar variations occur in the temperature of formation of ice crystals in natural supercooled clouds, then substantial differences in cloud behaviour should be observed on the corresponding days near Sydney but not near Tucson. The range of values recorded, from −16° C. to −33° C., appears to be consistent with the temperatures at which cumulus clouds are observed to glaciate.

Measurements in the Hawaiian Islands were taken at the top of the extinct volcano Haleakala on the island of Maui. It is 3,000 m. high and the top is nearly always above the trade wind inversion. Readings were taken at night in order to reduce the chance of sampling aerosols of local origin. A cloud chamber was used of a different design from those in the aircraft, and the measurements are not directly comparable. Its capacity was 50 litres. However, on certain days, namely, January 10, 23 and 29, the number of ice crystals observed at temperatures greater than − 25° C. was far larger than was the case on other days in January. These days are indicated on Fig. 1 by the letter *H*, all times being given as G.M.T.

Cwilong[3] has reported independent determinations of freezing nucleus in Panama using a small expansion chamber. Increases in the temperature at which effective nuclei were observed occurred on January 13, 18 and 31. These dates are indicated on Fig. 1 by the letter *P*. The dates on which fifty years total rainfall is abnormally high in Sydney are given by Bowen[1] as January 12–13, 22–23 and 31. These are indicated on Fig. 1 by the letter *R*.

If the rainfall singularities are associated with increases in concentration of freezing nuclei of cosmic origin, it might be expected that these various determinations of such nuclei would exhibit peaks at about the same time, and that the peaks would recur from year to year. It is therefore of interest to examine Fig. 1 from this point of view.

It can be seen that the two years measurements in Sydney do not agree well in the early part of January; but in the latter part of the month there are several features in common. The first rainfall peak, on January 12–13, coincides with peaks in the Sydney 1954 and 1955 curves, and with a peak at Panama. There is also a peak in Sydney (1954) on January 14. The second rainfall peak on January 22–23 again coincides with peaks in the Sydney 1954 and 1955 curves, and with a peak at Haleakala. The third rainfall peak, on January 31, coincides with a peak in Sydney (1954) and Panama, but peaks in Sydney (1955) and Haleakala occur two days before. The Panama peak of January 18 appears to be isolated.

It is not yet known what degree of consistency is to be expected from year to year and from place to place; and the present measurements, although not sufficient to confirm the theory, do show certain coincidences between rainfall singularities and peaks in the concentration of freezing nuclei at different geographical locations and at different times. It is hoped that the measurements can be continued in later years and in more places in order to help clarify

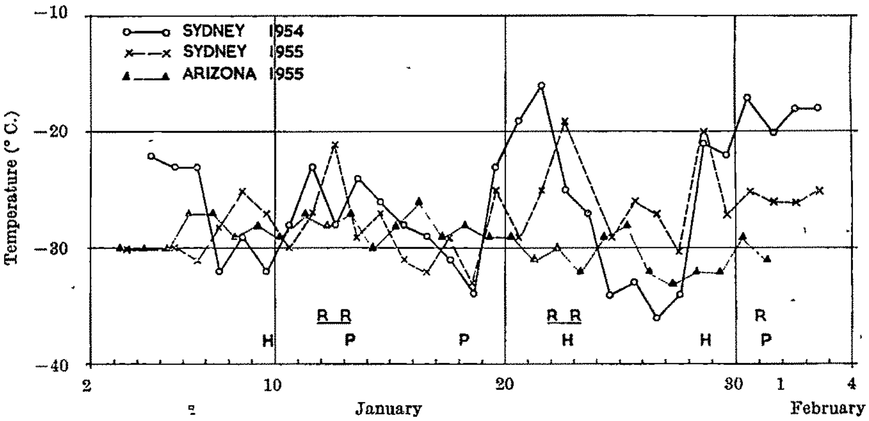

Fig. 1 Freezing nucleus measurements. Temperature at which one ice crystal per litre was observed

the question of whether there is a relationship between the concentration of freezing nuclei, meteor dust and the weather.

Electrolytic Desalting with Ion-Exchange Membranes

Separation of amino-acids and other substances by paper chromatography must often be preceded by the removal of inorganic salts. The common methods[1] require careful supervision, and under optimal conditions a loss of 10–20 per cent of many amino-acids may occur with 50 per cent loss of arginine by conversion to ornithine[2]. A simplified form of desalter, employing ion-exchange membranes, as suggested by Astrup and Stage[3], has been used in this Department for the routine preparation of plasma, urine and cerebrospinal fluid for paper chromatography. The apparatus consists of a small 'Perspex' container separated into three compartments by ion-exchange membranes (Fig. 1). The solution to be desalted in the centre compartment (3 ml.) is separated from the anode by an anion exchange membrane ('Permaplex' A.10) and from the cathode by a cation membrane ('Permaplex' C.10, both obtainable from Permutit, Ltd., London, W.4). The anode and cathode chambers are filled with 0·2 *N* sodium hydroxide and sulphuric acid respectively.

When a current is passed, the anion exchange membrane allows anions to move out of the centre compartment while preventing the ingress of cations, and the cation membrane permits the passage of cations, but retains anions. The net result is a loss of electrolyte from the centre compartment with an increase in the salt concentration in the outer compartments. The current is supplied by a 6-V. accumulator, and a variable resistance (0–500 ohms) regulates the initial current to 50 m.amp.

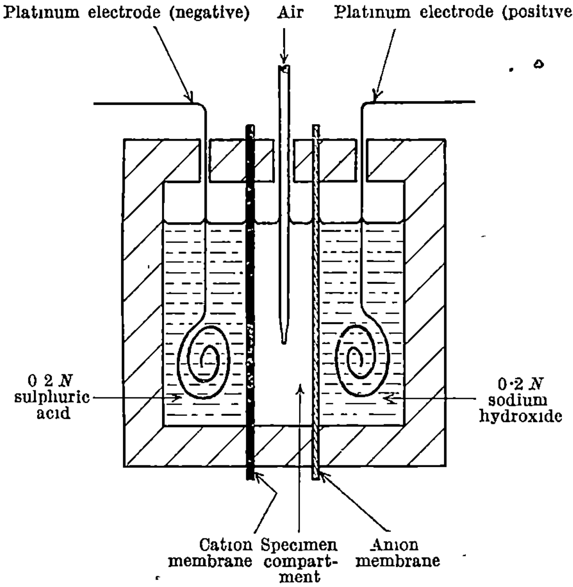

Fig. 1. Apparatus for electrolytic desalting with ion-exchange membranes

Table 1. Recoveries of Electrolytes and Amino-Nitrogen from Various Solutions after Desalting for 6 and 10 Minutes

Solution	Initial *p*H	Concentrations								
		Sodium (m.eq./litre)			Chloride (m.eq./litre)			Amino nitrogen (mgm. per cent)		
		0 (min.)	6	10	0 (min.)	6	10	0 (min.)	6	10
A. Salts + Glycine Alanine Phenylalanine Valine	7·2	126	55	37	100	52	29	5·6	5·3	4·8
B. Salts + Glycine Alanine Glutamic acid Arginine	7·3	124	56	22	103	49	31	6·0	5·8	4·6
C. Salts + Glutamic acid	7·2	127	49	30	100	50	27	6·2	4·2	4·3
Aspartic acid	4·4	125	53	28	100	45	30	6·2	4·9	4·4
D. Salts + Arginine	7·3	130	65	25	105	47	33	6·3	4·4	4·0
Lysine	8·8	130	60	20	105	53	30	6·3	5·3	5·0
Serum ultrafiltrate	7·1	139	40	19	—			10·9	9·0	7·0

Some loss of amino-acid is inevitable, and depends upon the dissociation of the various acids and also on the relative mobility of their ions. The rates of loss of the principal electrolytes of serum and of amino-acids were measured under standard conditions. A double-strength solution of plasma electrolytes was mixed with equal volumes of 0·01 *M* solutions of amino-acids, and desalted for 6 and 10 min.; the analytical results are shown in Table 1. The loss of neutral amino-acids was slight with an initial *p*H of 7·2 in the desalted solution. The greater losses of acidic and basic amino-acids could be reduced by bringing the initial *p*H nearer the *iso*electric point of the amino-acids concerned. Desalting of serum ultrafiltrates and casein hydrolysate solutions gave similar results.

A steep fall in current occurred after 6 min., when the salt concentration fell to about 30 per cent of its initial value; this level permits satisfactory separation on paper of amino-acids in serum, cerebrospinal fluid and concentrated urine samples. A fall in the *p*H of the solution during desalting occurs which increases the loss of basic amino-acids. This can be largely overcome by the addition of 0·1 *N* potassium carbonate to adjust the initial *p*H of the solution to 8·0. For routine chromatography of biological material for diagnostic purposes, neutralization of the samples is all that is necessary, since 25 per cent differences in concentration are the least that can be detected on paper.

Destruction of Thyroxine by Electrolytic Desalting

It is well known that artefacts and serious distortion can be caused during paper chromatography if acids are present in the solution being chromatographed, and that they can be eliminated by initial electrolytic desalting. In a recent communication[1], Acland confirmed that trichloracetic acid can be "largely" removed by desalting the solution electrolytically; as an example, he showed that the chromatographic picture from a mixture of thyroxine and trichloracetic acid was very distorted, whereas that from a mixture of thyroxine and 'desalted' trichloracetic acid was relatively undistorted.

It might therefore be supposed that electrolytic desalting of thyroxine extracts containing trichloracetic acid would improve their chromatographic investigation. We wish to point out that this is not the case, as the electrolytic desalting of thyroxine solutions leads to rapid reductive deiodination. After 10 mgm. of thyroxine, dissolved in 1 ml. of aqueous methanol containing trichloracetic acid or any other acid, had been subjected to electrolytic desalting at 500–250 m.amp. for 10 min., paper chromatography showed only thyronine to be present (ninhydrin reagent), with no detectable organically bound iodine (ceric sulphate – arsenite reagent, which would have shown as little as 1 per cent remaining[2]). Desalting for shorter periods (1 min.) gave intermediate products identified as various iodo-thyronines. When an aqueous solution of trichloracetic acid (1 ml. containing 10 mgm.) was desalted at 500–100 m.amp. for 7 min. its *p*H rose to 5·5, indicating virtually complete removal of the acid.

Further work on the stepwise dehalogenation of polyhalogen derivatives of tyrosine and thyronine will be reported elsewhere[3].

Use of Gas–Liquid Partition Chromatography as a Preparative Method

The sharp separations obtainable by gas–liquid partition chomatography[1] would make it a useful alternative to distillation as a method for the purification of volatile compounds if the quality of the separations could be maintained on large columns. Evans and Tatlow[2] have described a column, 16 ft. long by 3 cm. internal diameter, which is suitable for the separation of 2–8 gm. of fluorocarbons. It is not yet clear, however, how much further the increase in size can be carried; but in any event, as so far developed, chromatography remains a batch process. Hence another line of approach to the problem of processing large amounts of material would be the automatic repetition of the cycle of batch operations, that is, injection of the charge and isolation of the pure material as it emerges from the column. This approach would be applicable whatever size columns are finally adopted.

Under fixed column conditions, each substance emerges at a constant time after injection, and this suggested that a clock might be used for controlling the cyclic process. We have constructed such a clock and used it successfully in the separation of C_4 hydrocarbon gases. In itself, the chromatographic apparatus is similar to those previously described, except that the column is somewhat larger (1 m. long by 15 mm. internal diameter) and two solenoid-operated valves are incorporated in the flow line. The gaseous sample is admitted to the column through one valve and the outlet gas can be deflected from one to another of two collecting traps by means of the other valve, which is located immediately after the detector[3]. The clock comprises a 'Londex' *PR/S* timer and a 50-position uniselector arranged to give a cycle of variable length divided into fifty equal intervals. At the beginning of each cycle, the inlet valve opens and a charge of the hydrocarbon gas is admitted to the column inlet, the amount depending on the pressure and the length of time the valve is open. The recorder trace for the detector is observed, and those positions of the uniselector corresponding to the peak required are wired together to operate the outlet valve and divert the flow of gas; in this way the wanted material is separated from the remainder. At a given column temperature the times of emergence of the component peaks can be varied by altering the rate of flow of the carrier gas which, together with the length of cycle, is arranged so that all the remaining components are eluted from the column before the next appearance of the peak required. So far, we have used cycles of 15–20 min. duration, (nitrogen) carrier-gas rates of about 30 l./hr. and a charge of somewhat less than 1 gm. (giving a daily throughput of between 70 and 80 gm.). Low-boiling materials prove difficult to remove from the carrier-gas stream, and it has been found most satisfactory to fill the collecting traps with activated alumina gel. In use they are immersed in a Dewar vessel containing solid carbon dioxide, and the gas can easily be recovered on warming.

The success of the method depends upon the pattern produced on the recorder remaining in phase with the clock. Such constancy in the times of emergence of the components of a mixture has been achieved in the trials so far carried out by attention to three factors: the temperature of the column (which was packed on ice), the rate of flow of the carrier gas, and its presaturation with the solvent used. In these conditions successful runs, lasting several days, have resulted in the expected separation and no adjustments to the clock have been required.

The work described has been carried out as part of the programme of the Chemical Research Laboratory, by permission of the Director of which this communication is published.

Determination of Chromium, Vanadium and Tungsten by Activation Analysis using Low-Level Neutron Sources

A RADIOCHEMICAL method for the determination of chromium, vanadium and tungsten by means of radioactive silver was suggested by J. Govaerts[1]. Insoluble silver salts can be prepared by means of these elements. Using a solution of radioactive silver nitrate, a standard curve is obtained indicating the activity of the precipitate as a function of the quantity of metal present. The purpose of the present work was to use the same silver salts in order to determine the amount of element present by means of thermal neutron activation of silver ($T_{\frac{1}{2}} = 22$ sec. and 2·3 min.), which quantity is proportional to that of the unknown element.

Preliminary investigations indicated that chromium and tungsten are not activated by a thermal neutron source of 270 mgm. radium–beryllium when exposed during 10 min. Under the same conditions, vanadium is fairly well activated ($T_{\frac{1}{2}} = 4·5$ min.) and this activity adds to that of silver. Up to 25 mgm./cm.², no corrections for self-absorption are required for either of the three insoluble silver salts.

By means of a neutral solution of silver nitrate, chromium is precipitated as silver chromate[2], vanadium as silver vanadate[3] and tungsten as silver tungstate[4]. A Geiger–Müller tube with thin mica window is used for the measurements of radioactivity. The compounds are collected in a uniform and reproducible manner. One of the techniques used is similar to that described by R. H. Hendricks *et al.*[5] for mounting barium-14 carbonate on a flat circular disk of aluminium by gravity settling, except that we have used 'Plexiglas' plates, which are not activated by neutrons. A demountable centrifuge tube can also be used[6]. With certain precautions the precipitate can be collected quantitatively. Using different amounts of silver salts, standard curves are obtained indicating the activity of the precipitate as a function of the quantity of the metal present (Fig. 1). The procedure to determine an unknown concentration is to collect the precipitate on a fritted-glass filter; the precipitate is dried and weighed. The total precipitate, or a known aliquot part, is then collected on a 'Plexiglas' plate and activated; the same geometrical conditions are used for all radioactivity measurements. The amount of the element present on the plate is read on the standard curve.

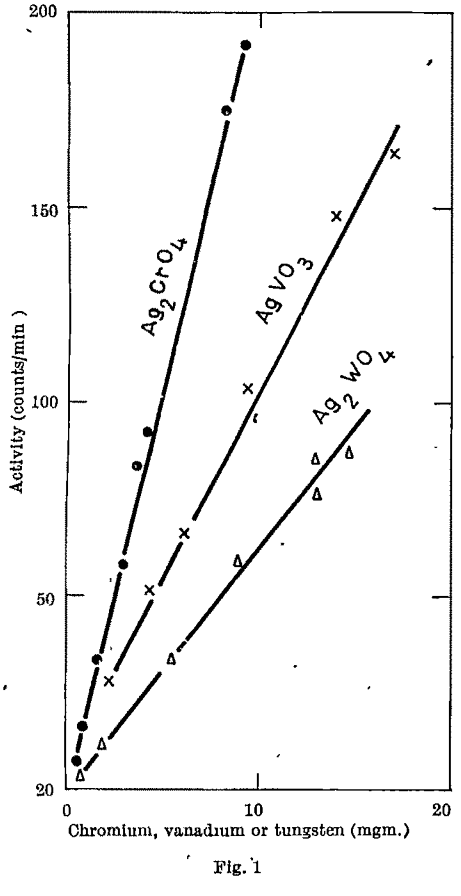

Fig. 1

The method described is very quick, sensitive and well suited to routine use.

I wish to thank Prof. G. Gueben for the opportunity of working in the Institute of Nuclear Studies, Liège, and Prof. J. Govaerts for his interest.

Infra-Red Absorption Spectra and Protein-Sugar Interactions

BIOLOGICAL materials consisting largely of protein and carbohydrate give rise to infra-red absorption spectra which show the main characteristic absorption bands of the protein and carbohydrate structures. A more detailed study of the spectra of such biological materials reveals a number of important differences from the spectra expected by the direct addition of the typical protein and carbohydrate spectra, and these differences confirm the suggested interaction of the protein with the carbohydrate.

The infra-red spectra of most sugars show a series of sharp absorption bands in the 1,050 cm.$^{-1}$ region[1], similar to those shown in spectrum *A* (Fig. 1). In biological materials containing sugar these sharp bands are replaced by bands of much broader structure, similar to those shown in spectrum *B*. Such broad bands can be observed in the published infra-red spectra of bacteria[2] and tissues[3], and also in unpublished spectra obtained from dried milk and freeze-dried bovine uterine cervical secretions.

This protein–sugar interaction and its effects upon the infra-red spectra can be demonstrated by the spectra of casein and lactose shown in Fig. 1. Spectrum *A* was obtained from a dry intimate mixture of casein (soluble, commercial product) and lactose (freeze-dried monohydrate) made up in the same proportions as are present in cow's milk, that is, approximately 3 parts by weight of casein to 5 parts of lactose. Spectrum *B* was obtained by dissolving the same mixture in water at room temperature and then freeze-drying. Similar results have been obtained for casein–glucose and casein–sucrose mixtures.

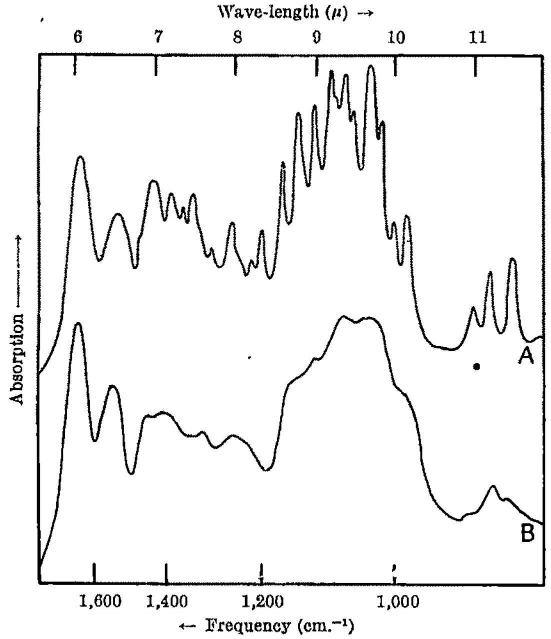

Fig. 1. *A*, lactose–casein dry mixture; *B*, lactose–casein, freeze dried from aqueous solution

It is probable that this interaction of casein with sugars forms the first stage in the series of reactions studied by Lea and his co-workers[4] in relation to the browning of milk.

Since the carbohydrate absorption bands in the 1,050 cm.$^{-1}$ region are generally associated with the C—O stretching and the O—H bending vibrations, it seems likely that the carbohydrate and protein molecules are held together by a hydrogen-bonding mechanism. Such interaction would be expected to affect the carbohydrate bands in this region of the spectrum as well as in the more usually studied 3μ region.

The spectra were obtained with a double-beam Grubb Parsons *S3A* infra-red spectrometer fitted with a rocksalt prism. Samples were examined in potassium bromide disks, and similar results were also obtained using the 'Nujol' mull technique with the same samples.

Separation of the Isomers of Benzene Hexachloride by Reversed-Phase Paper-Partition Chromatography

A simple and rapid paper chromatographic method was required for separating mixtures of isomers of benzene hexachloride. The paper chromatographic method of Moynihan and O'Colla[1], further developed by O'Colla[2] and Mitchell[3], gives a satisfactory separation, but the acetic anhydride, used as the stationary phase, is an unpleasant reagent to handle. The use of 'Vaseline'-impregnated strips has been previously described for the separation of DDT derivatives[4], and there was some evidence that separation of isomers of benzene hexachloride could be achieved by the application of a similar technique[5]. The method has been adapted as follows.

Whatman No. 1 filter paper strips were washed overnight by allowing distilled water to travel down the strips as in chromatography in order to remove an inorganic halide contaminant present in the paper. The strips were then dried, dipped in a 5 per cent ethereal solution (w/v) of Paraffinum Molle Album, drained and dried. The mixture of the isomers in acetone solution was applied as a small spot near the top of a strip. The mobile phase, consisting, by volume, of 70 per cent methanol and 30 per cent distilled water, was allowed to descend the strip in the normal way. The strip was left at laboratory temperature for 18 hr., during which time the solvent had travelled approximately 40 cm.

The strip was dried and the positions of the isomers detected by dipping it in redistilled monoethanolamine, heating at 100° for ½ hr. and then dipping in a $0 \cdot 1\,N$ solution of silver nitrate acidified with concentrated nitric acid (10 vol. silver nitrate solution : 1 vol. acid). On exposure to ultra-violet light (*c.* 254 mμ) brown spots appeared corresponding to the positions of the isomers. It was essential to remove all the monoethanolamine before dipping in silver nitrate solution, otherwise a background colour developed which masked the spots. The alpha-, beta-, gamma- and delta-isomers moved with mean R_F values of 0·33, 0·00, 0·40 and 0·58 respectively. The method of detection was sensitive to less than 5 μgm. of the alpha-, gamma- and delta-isomers, but was less sensitive in the case of the beta-isomer, 5 μgm. of which was only just detectable.

η-Tocopherol (7-Methyltocol): a New Tocopherol in Rice

Recent publications have confirmed the existence of two previously unknown natural tocopherols in the lipid fractions of cereal grains (ε- and ζ-tocopherols) and have described methods for their separation by paper chromatography[1-3]. Thus six of the seven possible tocol structures produced by methylation of the tocopherol chroman nucleus have been identified, and it was of interest to search for the remaining tocopherol (7-methyltocol) among natural sources. In a comprehensive study of the vitamin E content of various foodstuffs, Harris, Quaife and Swanson[4] reported some years ago that 50 per cent of the total tocopherols in rice were γ- and δ-tocopherols. These authors used the diazo-coupling method of analysis[5] for this identification. Since this observation conflicted with our own observations on tocopherol patterns in cereal products, we have re-investigated the vitamin E content of rice.

The lipid fraction was extracted with ether from ground whole Japanese rice. After the usual purification by alkaline saponification and treatment with floridin earth, the vitamin E complex was analysed by two-dimensional chromatography[2]. The papers, after spraying with ferric chloride – dipyridyl reagent in ethanol, showed three well-defined spots in the α-, ε- and ζ-positions; γ- and δ-tocopherols were absent. However, the spot in the ε-position, on spraying with diazotized *o*-dianisidine in alkaline solution, showed a strong positive reaction, given only with tocopherols having a free, non-methylated 5-position. The known ε-tocopherol does not react with this reagent, and, by methods of separation to be described elsewhere, it was shown that rice contains little or no ε-tocopherol. From its chromatographic behaviour (which assigns it the structure of a monomethylated tocopherol) and reaction with the *o*-dianisidine reagent, therefore, the new spot was considered to be due to 7-methyltocol, which, according to custom, has been named η-tocopherol. Rice contains α-, ζ- and η-tocopherols in the proportion 47 : 26 : 27.

Extraction of 200 gm. of whole rice followed by saponification of the oil, chromatography and isolation by two-dimensional paper chromatography on multiple papers by methods already described[2] gave nearly 3 mgm. of almost pure η-tocopherol. The new tocopherol could be assayed normally with the Emmerie–Engel reagent and coupled immediately with the *o*-dianisidine reagent. It had an absorption maximum at 293 mμ (E(1 per cent, 1 cm.), 78) and gave a yellow nitroso derivative with nitrous acid. Oxidation with nitric acid, according to Smith *et al.*[6], gave the red *o*-quinone, with absorption maximum at 477 mμ (E(1 per cent, 1 cm.), 56). The identity of η-tocopherol with 7-methyltocol was finally confirmed by direct methylation on 1 mgm. of the substance by reaction with formaldehyde, hydrochloric acid and stannous chloride[7]. The methylated product, on two-dimensional paper chromatography, gave two new spots, identified by R and R_F values and chemical tests as α- and ζ-tocopherols.

All seven possible tocopherols with methyl groups in the chroman nucleus have now been shown to occur in Nature.

Thermodynamic Aspects of the Action of Phosphohexoseisomerase

The isomerization of glucose-6-phosphate ⇄ fructose-6-phosphate is catalysed by the enzyme phosphohexoseisomerase[1], and at equilibrium a mixture of aldose and ketose in the proportion of 6/4 is present[2,3]. Although Bruns and Hinsberg[2] have investigated the kinetics of this isomerase system by the method which was also employed in the present experiments, the thermodynamic properties of this reaction have not been studied.

The free-energy change and activation-energy change of the isomerization process can be calculated from earlier data concerning the effect of temperature on reaction velocity. From the equilibrium constant K calculated from the molar concentration of the reactants,

$$K = \frac{[\text{Glucose-6-phosphate}]}{[\text{Fructose-6-phosphate}]} \qquad (1)$$

the free-energy change of − 84 cal. mole⁻¹ was obtained based on the equation

$$\Delta F^{\circ} = -RT \ln K \qquad (2)$$

The reaction kinetics are of pseudo zero order in the presence of an excess of glucose-6-phosphate and may be formulated in the following way,

$$v_i = k_1 E S_0 \qquad (3)$$

where v_i is initial reaction velocity, S_0 is initial concentration of substrate, E is enzyme concentration and k_1 is reaction constant.

If k_1 is expressed in terms of the Arrhenius equation[4,5],

$$k_1 = PZ \exp(-\Delta E/RT) \qquad (4)$$

then, from earlier results[1] when v_i was studied as a function of T over the range 23°–40° C., log v_i is proportional to $1/T$, and the activation energy, ΔE, can be evaluated as − 11·3 kcal./mole⁻¹.

When Eyring's equation[5],

$$k_1 = \frac{kT}{h} \exp\left(-\frac{\Delta H^*}{RT}\right) \exp\left(\frac{\Delta S^*}{R}\right) \qquad (5)$$

is applied, ΔH^*, the heat of activation, can be estimated. From the proportionality of log v_i/T to $1/T$, ΔH^* (10·4 kcal./mole) also can be evaluated using the slope of a plot of log v_i/T versus $1/T$. A diagram demonstrating the energy relationship of this reaction is shown in Fig. 1.

The activation energy can be estimated from bond energies. If we assume the following 'activated

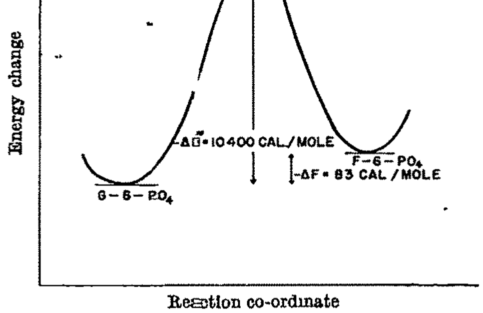

Fig. 1

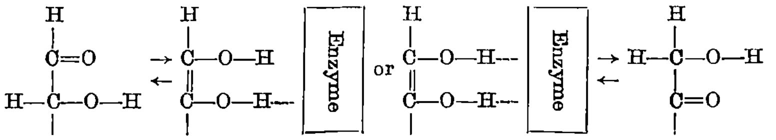
complexes' of the hypothetical intermediary ene–diols with the isomerase,



the differences of the bond energies[6] in the activated complexes as compared with glucose-6-phosphate or fructose-6-phosphate are about – 9 kcal./mole or – 14 kcal./mole, respectively. In this estimate the energy of formation of the hydrogen bond is assumed to be 5 kcal./mole. Although the exact structure of the 'activated complex' is unknown, the activation energy estimated on the basis of the above structure is in reasonably good agreement with the values calculated from kinetic experiments. Since the activation energies based on other possible structures of the activated complexes deviate considerably from those obtained from the experimental observations, the structure of the 'activated complex' proposed above does not seem unreasonable. Such a postulated complex in the isomerase system should have an activation energy of about 10 kcal./mole. This excludes complexes with a saturated C—C bond or those involving electrostatic forces between oxygen and the enzyme.

The linear relationship of log v_i to $1/T$ holds at higher temperature, and therefore ΔE of denaturation by heat may be calculated from equation (4). As a result, a value of 26·8 kcal./mole is obtained, which is of an order comparable with that reported for heat denaturation of other enzymes[7].

This investigation was supported in part by the U.S. Atomic Energy Commission.

Bacterial Degradation of Heparin

A SOIL bacterium has been isolated in pure form by repeated transfers on a liquid medium which contained 0·1 per cent heparin, 0·1 per cent ammonium sulphate, and trace amounts of magnesium, calcium, manganese, ferrous iron and molybdate in 0·1 *M* phosphate buffer (*p*H 7·4) and on silica gel plates with a similar medium evaporated on the surface. The organism is an aerobic, Gram-negative, non-spore forming, very small, motile rod which had been identified as a *Flavobacterium*. It is able to use heparin as its sole source of carbon, nitrogen and sulphur, although its growth is enhanced by the addition of small amounts of glucose and ammonium sulphate. Optimum growth occurs at *p*H 6·5 and 24°; the bacterium will not grow at 37° and its growth is inhibited by carbon dioxide and agar (when grown on heparin). When grown on heparin silica gel plates the bacteria form clear, lemon-yellow, round, microscopic colonies; on trypticase–phytone agar plates the colonies are larger and dark orange-yellow in colour.

Due to its high cost, heparin cannot be used as substrate for large-scale bacterial preparations. In order to obtain cells in large quantity, the bacteria were cultured on a medium which consisted of 1·7 per cent trypticase, 0·3 per cent phytone, 0·25 per cent glucose, 0·5 per cent sodium chloride and 0·25 per cent dipotassium hydrogen phosphate in tap water. The cells were harvested after two weeks and washed free of medium with 0·1 *M* phosphate buffer (*p*H 7·4). They were then adapted to heparin by the following procedure. A thick suspension of washed cells was aerated at 24° for a starvation period of 2 hr Heparin (35 mgm. per 100 ml.), casein hydrolysate (50 mgm. per 100 ml.) and yeast extract (5 mgm. per 100 ml.) were added and the aeration continued. Adaptation occurred within three hours (the adaptation period was halted when 50 per cent of the heparin had disappeared). The cells were collected, washed with distilled water, lyophilized and stored in a vacuum desiccator at – 20°.

Dried cells prepared in this manner metabolized heparin both aerobically and anaerobically. In both instances, as was also the case for growth and adaptation of the organism, the reaction proceeded optimally at 24° and not at all at 37°. The disappearance of heparin was more rapid under anaerobic conditions. The dried cells appear able to degrade heparin by

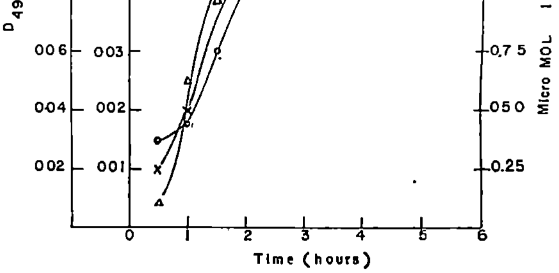

Fig. 1. Accumulation of reaction products during the degradation of heparin by dried cells. The incubation vessels contained 2 mgm. of heparin and 5 mgm. of dried cells in 2·5 ml. of 0·1 *M* phosphate buffer, *p*H 7·4. The vessels were incubated at 24° in an atmosphere of nitrogen–carbon dioxide (95 : 5). At each of the times indicated one vessel was removed and analysed for heparin (ref. 1) ●, reducing groups (ref. 2) ×, periodate titratable groups (ref. 3) △, and glucosamine (ref. 4) ○. Heparin determinations were performed on aliquots of 0·02 ml., reducing groups on aliquots of 0·10 ml., periodate titrations on aliquots of 0·1 ml., and glucosamine on aliquots of 0·2 ml. Values obtained in control vessels in which dried cells were incubated without heparin have been subtracted in all cases

two different mechanisms. Thus, aerobically, heparin was degraded more rapidly at *p*H 6·5 than at 8·5, whereas anaerobically the reverse was true. In preliminary experiments with borate buffer under aerobic conditions, heparin was degraded more rapidly at *p*H 8·5 than at 6·5. There may, then, be one reaction sequence (with optimum *p*H 6·5) which requires both oxygen and phosphate, and another (with optimum *p*H 8·5) which functions in the absence of either oxygen or phosphate.

In preliminary experiments with wet cell suspensions of the adapted bacteria, it was found that neither acids nor carbon dioxide are formed during the anaerobic metabolism of heparin. When heparin was incubated anaerobically with dried cells, reducing groups, periodate titratable groups and glucosamine were formed (Fig. 1). The appearance of these reaction products before detectable disappearance of metachromasia indicates the accumulation of intermediates which, while no longer identical with 'native' heparin, are still metachromatic. The isolation and identification of such intermediates should help elucidate the fine structure of heparin.

We are indebted to Dr. C. B. Anfinsen, who suggested this approach. Sodium heparin (117 units/mgm.) was obtained through the kindness of Dr. L. L. Coleman, of the Upjohn Company, Kalamazoo, Michigan. One of us (A. N. P.) is a participant in the Foreign Research Science Program of the Foreign Operations Administration.

Uptake of Adenine-8-^{14}C by Whole and Fractional Amœbæ

RECENTLY, Goldstein and Plaut[1] have obtained direct evidence for the synthesis of cytoplasmic ribonucleic acid by the nucleus in *Amoeba proteus*. The demonstration by Brachet and Szafarz[2] that enucleate fragments of the unicellular alga *Acetabularia mediterranea* exhibit a distinct turnover of a precursor of ribonucleic acid (orotic acid) has been interpreted by Brachet[3] as indicative of cytoplasmic synthesis of ribonucleic acid in the absence of a nucleus. If these two findings are both applicable to cells in general, we could conclude that there are two basic systems of synthesis of cytoplasmic ribonucleic acid : one centred in the nucleus, and the other a cytoplasmic system which is independent of the nucleus. In order to investigate this possibility, we have undertaken a study of the incorporation of the ribonucleic acid precursor adenine-8-^{14}C into whole and fractional amœbæ. For a valid comparison of the rates of synthesis of cellular constituents it is necessary, first of all, to ascertain the intracellular availability for synthesis of a labelled precursor in whole and nucleate and enucleate half-cells[4]; otherwise an impaired ability to transfer a material across the cell membrane might be mistaken for a reduction or loss of synthetic capacity.

Table 1. UPTAKE OF ADENINE-8-^{14}C BY WHOLE (*W*), NUCLEATE HALF (*N*) AND ENUCLEATE HALF (*E*) AMŒBÆ

		Incubation time (hr.)		
		18	43	51
Counts/min./amœba (No. of cells in sample in parenthesis)	*W*	1·06 (25) 1·02 (24)	2·66 (50) 2·71 (60)	3·24 (25)
	N	0·69 (25) 0·88 (17)	2·12 (50) 2·03 (43)	2·58 (22)
	E	0·38 (19) 0·35 (24)	1·10 (50) 0·90 (60)	1·65 (11)
Ratios	*W/N*	1·32	1·30	1·26
	N/E	2·15	2·08	1·56

Counts are corrected for a background based on samples of the last wash-water, which never differed significantly from the general background : 11–12 counts per min.

Amœbæ (*A. proteus*) were cultured for 24-hr. in food-free medium. Some of them were then cut, free-hand, with a fine glass needle into nucleate and enucleate halves. After separation of the nucleate and enucleate halves, the cells, including a sample of whole amœbæ, were washed twice to remove possible debris and transferred to a food-free medium containing 1·7 μc. of adenine-8-^{14}C per ml. (0·13 mgm. per ml.). This ribonucleic acid precursor was chosen since experience in our laboratory has shown that it is readily incorporated into ribonucleic acid by amœbæ[5]. During the incubation period, samples of all three experimental groups were withdrawn at different times, dried on planchets after sufficient washing in inactive medium to remove external isotope, and assayed in a windowless gas-flow counter.

Taking the volume of an average whole amœba[6] as $8 \times 10^5\ \mu^3$ and that of a half amœba as $4 \times 10^5\ \mu^3$, we obtain, for equivalent volumes of labelled medium, an activity of about one count per minute corresponding to the whole cell and 0·5 count per minute for the half-cell. It can be seen from Table 1 that the measured activity of the cells and the half-cells reaches a higher level. From this comparison and from the evident linearity of the curves in Fig. 1,

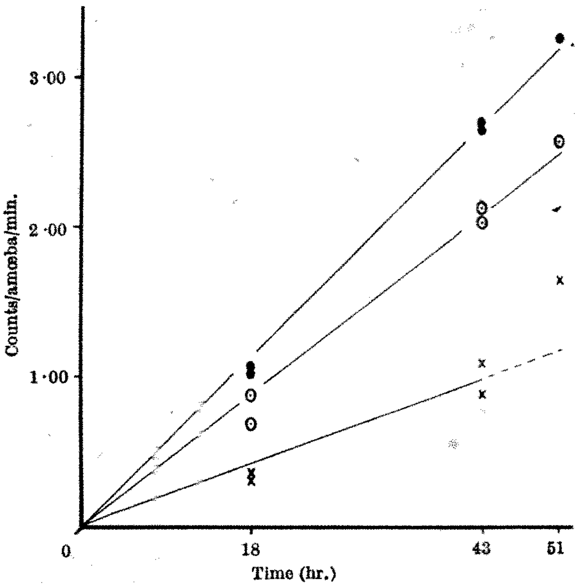

Fig. 1. ● Whole cells; ○ nucleate halves; × enucleate halves

we conclude that there is a continuous uptake of adenine-8-^{14}C and not a passive equilibration of cells with the medium.

Our results indicate that, as with other substances[7], the presence of the nucleus is not essential for the uptake of adenine. However, the ratio of 1·3 : 1 between whole amœbæ and nucleate halves shows that a doubling of the amount of cytoplasm increases the uptake by only 30 per cent. This fact, together with the distinctly higher ratio of 2·1 : 1 between nucleate halves and enucleate halves, demonstrates the importance of the nucleus in adenine uptake during the early incubation period. The value of the 51-hr. point for enucleate half amœbæ is questionable, because of the small size of the sample; but it is being rechecked in a series of experiments designed to elucidate the uptake and incorporation pattern of adenine over a longer period of time.

There are at least two possible interpretations for the higher activity within the cell than outside it; a mechanism may be in operation for the active uptake of adenine against a concentration gradient, or the intracellular adenine may be converted into other products. Whatever the reason, the fact that adenine enters the enucleate half-cell demonstrates its intracellular availability for incorporation or conversion processes if such processes take place.

This investigation was supported by University of California Cancer Research Funds, and by grants from the American Cancer Society, recommended by the Committee on Growth, National Research Council, to Dr. Daniel Mazia. We wish to thank Dr. Mazia for his valuable suggestions on the preparation of the manuscript.

A Virus in Chronic Respiratory Disease of Turkeys

IN the chronic respiratory disease syndrome of chickens and ducks, both a virus and pleuropneumonia-like organisms have been etiologically implicated[1]. Serological studies on infectious sinusitis of turkeys, utilizing a hæmagglutination-inhibition test, indicated that there is a relationship between presence of antibodies against the pleuropneumonia-like organisms and a clinical sinusitis[2]. However, in some birds, infection with the pleuropneumonia-like organisms did not result in development of a sinusitis. Observations on field-outbreaks of chronic respiratory disease and their relation to the onset and severity of sinusitis in turkey flocks seemed to indicate that the pleuropneumonia-like organisms did not serve to define the etiology of these syndromes. This became apparent in two outbreaks when it was demonstrated that a large percentage of the birds were serologically positive to the pleuropneumonia-like organisms prior to the onset of respiratory symptoms, and furthermore that sinusitis was observed in only 2–5 per cent of the birds. Within two weeks after the onset of the respiratory symptoms, 40 per cent of the birds in one flock and 60 per cent of the birds in the other flock developed sinusitis.

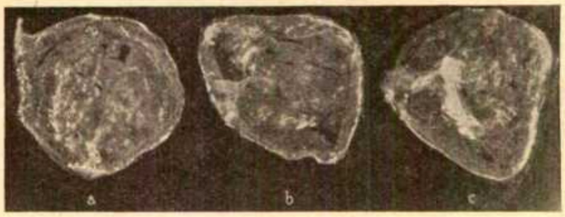

Fig. 1. Pocks on eleven-day old chorioallantoic membranes produced by viruses isolated from (*a*) chickens, (*b*) ducks and (*c*) turkeys infected with chronic respiratory disease

During the acute stage of the respiratory disease, turkeys from both outbreaks were killed, and attempts to isolate a virus were made by procedures which have proved practical for isolating viruses from similar clinical conditions in other fowl[1]. An agent which showed filterability, resistance to antibiotics and inability to be demonstrated with a variety of stains under the light microscope was isolated from both outbreaks. This agent, which is tentatively presumed to be a virus, grew in the yolk sac and chorioallantoic sac of chicken embryos and produced pocks on the chorioallantoic membrane. Specific embryo deaths followed inoculation into the chorioallantoic sac in 24–48 hr. and maximal pock production was observed on the chorioallantoic membrane in 72 hr. Fig. 1 compares the pocks produced by one of the turkey strains with those of chicken and duck strains of a virus with similar properties. It should be emphasized that this agent was not a pleuropneumonia-like organism, although these organisms were also isolated from the infected flocks. Another strain of the virus was isolated from a flock of turkeys experiencing a mild and transient respiratory disease. This isolation was of interest since the turkeys were free of infection with the pleuropneumonia-like organism, and infection with the virus did not result in sinusitis in any of the birds.

In an effort to identify this virus, serum neutralization tests were carried out in either the chorioallantoic sac or on the chorioallantoic membrane, using sera containing antibodies against infectious bronchitis, Newcastle disease and infectious laryngotracheitis viruses. No neutralization of the turkey virus could be demonstrated in any case, nor would sera from birds inoculated with the turkey virus neutralize any of the above viruses. This would seem to exclude the possibility that this new virus bears a *P–Q* relationship to infectious laryngotracheitis, since in Pulsford's work the *Q* variant produced antibodies fully active against laryngotracheitis virus[3].

The findings of a virus in chronic respiratory disease of turkeys with characteristics identical with those isolated from chickens and ducks would seem to indicate a common etiological factor in these syndromes. Proof of this contention, however, must await serological and cross-infection studies. The exact relation of this virus to the onset and incidence of sinusitis in turkeys infected with the pleuropneumonia-like organism similarly remains to be determined.

Abnormal Colour Responses of the Minnow resulting from Inhibition of Movement

WHEN a minnow (*Phoxinus phoxinus* L.) is allowed to swim freely on an illuminated white or black background, it becomes correspondingly pale or dark in colour and remains so indefinitely. However, if the fish is kept stationary by confining it on a white or black background in a glass tube containing running aerated water, its colour responses become abnormal[1].

During the first hour or so of confinement, the fish struggles; but later, escape reactions cease and the fish remains quiescent on the floor of the tube. Under these conditions on either a white or a black background the fish fails to become fully white- or black-adapted; it assumes an intermediate tint and maintains this indefinitely. However, if the fish confined on black is subjected to an extraneous stimulus, for example, a movement in its field of vision, sudden alteration of the rate of flow of water in the tube or change in hydrostatic pressure, it will suddenly become fully dark in tint and then in the following 15 min. slowly revert to the intermediate colour. In other words, an extraneous stimulus momentarily converts an abnormal black background response to a normal one. No response to an extraneous stimulus in a fish confined on white has been observed; the fish remains an intermediate tint.

The minnow melanophores are under the control of both nerves and pituitary hormones, and spinal section anterior to the fifteenth vertebra eliminates central nervous control, resulting in very slow background responses effected by hormones[2]. Confinement on black does not interfere with the slow darkening of such a spinal fish, and an extraneous stimulus never results in a momentary darkening. Similarly, when central nervous control is eliminated only from the anterior region of the body by sympathectomy and the fish confined on black, this region slowly becomes fully dark, while the posterior region remains intermediate in colour. In this case an extraneous stimulus results in a momentary darkening of the posterior body region, but has no effect on the anterior region. On the other hand, hypophysectomized fish confined on black maintain an intermediate tint and show a darkening response to an extraneous stimulus. Therefore, the abnormal tint caused by confinement appears to be due to interference with the nervous rather than the hormonal chromatic mechanism.

In an unrestricted environment the minnow is an extremely active fish. Confinement thus abolishes continuous somatic motor activities, imposing a learnt inhibition on the central nervous system. It seems probable that this inhibition becomes generalized and affects the brain centres controlling colour change. An extraneous stimulus appears to remove temporarily the central inhibition, permitting for a time a normal black-background response.

The abnormal response resulting from confinement on white is less easy to explain. Under these conditions normal, spinal and hypophysectomized fish alike remain intermediate in colour and show no reaction to an extraneous stimulus. Both nervous and hormonal mechanisms appear to become abnormal under these conditions, and the absence of a sudden paling in response to an extraneous stimulus in the case of normal or hypophysectomized fish remains at present unexplained.

Acknowledgments are due to Dr. E. G. Healey for supervision and to the Medical Research Council for a research scholarship.

Role of Ergothioneine and Catalase in Infection by Ergot Fungus (*Claviceps purpurea* Tul.)

I HAVE already shown that the activity of peroxidase and catalase in rye is altered by ergot infection[1]. It seems to be very probable that this circumstance indicates formation of peroxide in the host-plant. The present communication deals with the effect of hydrogen peroxide on germination of ergot conidia.

Ergot was cultivated on malt agar. Conidia of a culture 3–5 weeks old were germinated at 20–22° C. in hanging drops on a culture medium of the composition: KH_2PO_4 1·0 gm., $MgSO_4.7H_2O$ 0·6 gm., $CaCl_2$ 0·5 gm., asparagine 2·0 gm., saccharose 30·0 gm., distilled water 1 litre. To this culture medium was added hydrogen peroxide, ergothioneine and the centrifuged conidia-free substances of honey-dew.

We have found that hydrogen peroxide in a concentration of 5×10^{-3} *M* entirely inhibits the germination of conidia. This inhibition can be removed by 5×10^{-3} *M* ergothioneine. Ergothioneine by itself has no effect on germination. We were unable to demonstrate ergothioneine in saprophytic conidia by the Hunter diazo-reaction[2].

It is known that conidia of parasitic origin (honey-dew) are more aggressive than saprophytic ones[3]. Honey-dew was gathered from Petkus rye; it was diluted with water in the ratio of 1 : 50, then centrifuged and examined for ergothioneine. We were able to prove that the conidia do not contain ergothioneine; on the other hand, ergothioneine was present in the conidia-free substances of honey-dew. The conidia-free sap from 50 million conidia (about 0·1 ml. honey-dew) contains 0·2–0·5 mgm. ergothioneine. It should be noted that another substance present also gives the diazo-reaction; this substance shows a maximum absorption at 6300–7000 A. At the same time, we have also found that the catalase activity of washed honey-dew conidia and saprophytic conidia was weak. During 5 min., 0·27–0·85 mgm. hydrogen peroxide was decomposed *in vitro*. Honey-dew sap shows a high catalase activity; during 5 min., 4·54 mgm. hydrogen peroxide was destroyed.

When honey-dew sap was added to saprophytic conidia, a weak stimulation of germination and an

Table 1. INHIBITING EFFECT OF HYDROGEN PEROXIDE ON GERMINATION OF ERGOT CONIDIA OF SAPROPHYTIC ORIGIN (PER CENT) AND ON GROWTH OF GERM HYPHÆ (MICRA); ELIMINATION OF INHIBITING EFFECTS BY ERGOTHIONEINE AND BY HONEY-DEW SAP

Culture medium + inhibitor and protector	Conidia germinated during 24 hr.	
	No. (per cent)	Length (μ)

Control	17	105

intense stimulation of growth was observed. No toxic effect of hydrogen peroxide was found in the presence of honey-dew sap (see Table 1).

These results indicate that honey-dew contains certain substances which are stimulating and certain which are protective against hydrogen peroxide. Among the protective substances there are ergothioneine and catalase, which may at least partially account for the fact that honey-dew conidia are more aggressive than conidia of saprophytic origin[3].

I am indebted to Prof. G. Hunter for help in this investigation. It is proposed to publish fuller results elsewhere.

A Lysogenic Strain of *Rhizobium trifolii*

DURING the course of routine examination of strain *SU*298 (Sydney University strain) of *Rhizobium trifolii*, it was suspected that the strain was carrying a bacteriophage. Subsequent investigation proved strain *SU*298 to be lysogenic, and the closely related strain *SU*297 to be a susceptible indicator strain. The field-performances and relationships of these strains have recently been reviewed by Vincent[1]. The occurrence of lysogeny in *SU*298 was demonstrated by seeding yeast mannitol agar (0·4 per cent agar) with appropriate proportions of each strain and incubating the plates at 26° C. After 24–48 hr., plaques could be observed in the otherwise confluent growth of *SU*297. At the centre of each plaque was a colony of the lysogenic strain. The lysogenic nature of strain *SU*298 was confirmed by the fact that it proved to be resistant to the purified phage; strain *SU*297, on the other hand, was fully susceptible.

A series of colonial variants of strain *SU*298, the characteristics of which have been described in detail by Vincent[1], were examined to determine whether they were lysogenic. Only one variant, namely, *SU*298/536, was found to be non-lysogenic. Somewhat unexpectedly, this colony type was found to be resistant to the phage obtained from the lysogenic cultures. As the somatic antigenic constitution of *SU*298/536 was found by Vincent to differ considerably from that of the original strain *SU*298, the resistance to the phage could possibly be explained in terms of the suggestion by Marshall and Vincent[2] that the possession of a particular antigen is an essential prerequisite to the action of some strains of bacteriophage on *R. trifolii*.

On present evidence, the practical significance of *Rhizobium* – bacteriophage interaction in soils is somewhat questionable. Similarly, lysogenic strains of root-nodule bacteria may be of questionable significance in soils, although it is felt that the inherent resistance of a lysogenic strain to a particular phage would be to its advantage in soils containing such a phage. The occurrence of lysogeny may be of more practical significance where mixtures of strains are used in the preparation of peat cultures for legume inoculation. Both the lysogenic strain *SU*298 and the susceptible indicator strain *SU*297 have been used in mixed cultures in Australia. I have recently demonstrated (unpublished results) that strain *SU*298 dominates strain *SU*297 when they are mixed in peat. Investigations are in progress to determine whether this is due to the susceptibility of *SU*297 to the phage of the lysogenic *SU*298.

Deoxyribonucleic Acid Deficiency in the Mature Egg Nucleus of *Aloe davyana* in South Africa

RECENTLY, there have been two or three accounts of deoxyribonucleic acid deficiency in the egg nucleus of both angiosperms and algae. Delay, for example[1], states that the egg nucleus in the oogonium of *Chara* was found to be Feulgen-negative, whereas the antherozoids were Feulgen-positive right up to the commencement of fusion. Rowlands[2] makes a similar observation on the embryo sac of *Vicia* and puts forward a reason for the deficiency. It was felt that it might prove useful to report a like deficiency in *Aloe davyana*.

The material used in the investigation was collected at Mondeor in the vicinity of Johannesburg in August 1954 by Miss D. Dimovic. The time of collection was one of extremely low mean night temperatures.

The development of the embryo sac of *Aloe davyana* has proved to be of the eight-nucleated type in which the antipodals disintegrate very early.

Previously all stages of the young embryo sac had been stained with crystal violet and had stained well, showing good deoxyribonucleic acid content. The mature embryo sacs over three seasons, however, showed only very faint coloration or none, particularly in the case of the egg nuclei. The synergids and central nuclei were darker, but still did not compare with the deep violet of nucellus nuclei. The optimal thickness for sections was found to be 18μ, and crystal violet stained equally well after Navashin and formalin–acetic–alcohol fixatives. After formalin–acetic–alcohol, using hæmatoxylin, which is not specific for deoxyribonucleic acid, the egg nucleus stained well.

Next the Feulgen method was applied, using cold hydrolysis in 5 *N* hydrochloric acid for forty minutes to one hour at room temperature[3]. The same gradation of colour in the embryo sac as mentioned above was observed in each case. Since leuco-basic fuchsin is specific for deoxyribonucleic acid, the pale pink of the mature egg nucleus against the deep red nucellus nuclei may be taken as proof of deficiency. Feulgen-light green staining was used with the same result.

The Feulgen staining was particularly good after Navashin fixative but also strong after formalin–acetic–alcohol.

The Feulgen stain may also be used for the quantitative determination of deoxyribonucleic acid; but this method was not employed during the above investigation.

It was found that the dividing zygote, even in early prophase, showed deep red chromonemata, evidence that deficiency disappears on fertilization.

With both crystal violet and Feulgen staining, the male nuclei lying free in the embryo sac stained very strongly, quite equal to the nucellus in intensity even when in contact with the egg. Actual fusion was not observed. The male nuclei proved to be exceptionally large and were vermiform or spirally curved. No nucleolus was observed.

In an attempt to gain further proof of deoxyribonucleic acid deficiency, methyl green – pyronin staining was applied after acetic alcohol fixation. Methyl green from Grübler (Leipzig) and pyronin from Gurr (London) was used. Unna's mixture, as tried by Darlington and La Cour, and various modifications suggested by Kurnick[4], Taft and Brachet[5], were tried, together with several differentiation media[6]. The dyes were purified by the methods of Sibatani[6].

Unfortunately, although the methyl green (specific for deoxyribonucleic acid) proved satisfactory, the pyronin available was of unknown type and results on the whole were disappointing. With Kurnick's and Brachet's methods, using a differentiating mixture of absolute alcohol 1/*iso*propyl alcohol 1 for as short a time as possible, it was found that egg nuclei stained pale green compared with nucellus nuclei, whereas the male nuclei were very green indeed. The results bear out the supposition of deoxyribonucleic acid deficiency in the egg nucleus, while the male nucleus shows none of these tendencies.

Quite often during methyl green – pyronin staining the synergid cytoplasm, which should have gone red, gave a green stain instead. The same phenomenon was seen using crystal violet, hæmatoxylin and leuco-basic fuchsin, when the synergids stained violet, black and red respectively. Evidence of deoxyribonucleic acid in the cytoplasm was taken to mean that disintegration of the synergid nuclei had resulted in deoxyribonucleic acid escaping into the cytoplasm. Occasionally, using methyl green – pyronin, the egg nucleus stained red.

The evidence for supposed deoxyribonucleic acid deficiency in the mature egg nucleus of *Aloe davyana* can be attributed to: (*a*) masking by some unknown substance; (*b*) conditions at the time of collection; (*c*) actual deficiency.

So far as (*a*) is concerned, it is difficult to reconcile this argument with the fact that semi-specific crystal violet, as well as leuco-basic fuchsin and methyl green, gives evidence of faint staining only, whereas hæmatoxylin shows full staining of the egg nucleus.

If the severe change from day to night temperature during the collecting period affects the egg nucleus, why is the nucellus, subjected to exactly the same conditions, not changed as well? Possibly the egg nucleus and, indeed, the embryo sac in general, is more sensitive than the nucellus nuclei; but one would expect the male nucleus to have the same tendencies.

Neither (*a*) nor (*b*) is an entirely satisfactory answer to the question, and actual deficiency seems more probable at this stage, especially since the Feulgen reaction can be used for the quantitative determination of deoxyribonucleic acid.

Crystal violet staining in this Department of the embryo sac of *Ornithogalum virense* by J. Gafin (unpublished) has shown no deficiency in the egg nucleus of this plant. If *Aloe davyana* is indeed deficient in deoxyribonucleic acid, it is a rare case and certainly merits further investigation.

It should be noted that *Aloe davyana* is a plant which sets seed easily and abundantly.

Influence of Day-length on Nodule Formation in *Soja hispida* by a Specific *Rhizobium* Strain

Experiments have been carried out upon the action of day-length on the formation of nodules by a specific *Rhizobium* strain. Two different varieties of *Soja hispida* (Capitole and Kouban 0375) were used. In each case, four series were made: two were exposed to an 8-hr. day, and the other two to a 16-hr. day. Both for the 8- and the 16-hr. day, one group was sown with the specific *Rhizobium*, the other being sown without the *Rhizobium* (control). The temperature of the room was maintained at 20° C. during the whole experiment in the phytotron installation at Liège. Artificial light was given by six fluorescent 'Phytor' lamps at 65 cm. from the soil (4,500 lux at the soil surface).

It was observed that the *Rhizobium* was able to colonize perfectly the roots of plants in the case of the 16-hr. day, whereas for an 8-hr. day colonization remained very feeble.

With a 16-hr. day, heavy and numerous nodules functionally effective, developing a dark red colour in the internal tissue, were obtained. On the contrary, for an 8-hr. day, nodules were rare and very small; the colour of the inside tissue was pink only for the largest of them; in one experiment, there was total absence of nodules with an 8-hr. day (Fig. 1).

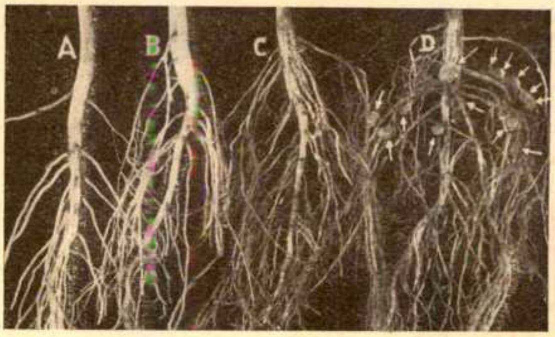

Fig. 1. (*A*) Roots of plants in 8-hr. day, without *Rhizobium*. (*B*) Roots of plants in 8-hr. day, with *Rhizobium* (no nodules are formed). (*C*) Roots of plants in 16-hr. day, without *Rhizobium*. (*D*) Roots of plants in 16-hr. day, with *Rhizobium* (heavy and numerous nodules are formed; indicated by the arrows)

It appears that the day-length to which the leaves of the plants are exposed—in other words, the functioning of the leaves—has an influence on nodule formation by a specific *Rhizobium* and specially on the functional effectiveness of the nodules.

A Biologically Active Fatty-acid in Malvaceae

It has been known for many years that the ingestion by hens of malvaceous plants or crude fats derived from such plants gives rise to pink 'whites' in stored eggs[1]. Schaible and Bandemer[2] showed that the pink discoloration was caused by iron diffusing from the yolk and chelating with the conalbumin of the white. The disorder is accompanied by a putty-like condition of the yolks when the eggs are cold, and affected yolks have a higher water content than normal. The pH values of the yolk and white, normally 6·5 and 9·0 respectively, tend to converge. Schaible and Bandemer[2] suggested that the effects of a diet containing malvaceous products could be explained by an increased permeability of the vitelline membrane surrounding the yolk.

Since the active principle in Malvaceae has not hitherto been identified, chemical studies have been carried out on the oils extracted from the leaves and seeds of *Malva verticillata* and *M. parviflora* and from cotton seed (*Gossypium hirsutum*). As oils of malvaceous plants are known to give a positive reaction to the Halphen test[3], attempts were made to isolate the constituent giving rise to this reaction. The biological activity of several fractions of the oil has also been studied. The results show that the factor in malvaceous oils promoting the development of pink whites is an unsaturated fatty-acid, which may be identical with the acid giving the Halphen test.

In each oil tested, the Halphen test was invariably given by the saponifiable fraction. Low-temperature crystallization of the mixed fatty-acids from acetone solutions yielded fractions giving increasingly intense Halphen tests as the saturated and part of the unsaturated acids were removed. Since the acid giving the Halphen test (referred to here as 'Halphen acid') is heat-labile and readily oxidized, separation by fractional distillation of the methyl esters is not feasible. Reversed-phase partition chromatography[4] has been used for separation. After passing the fractions rich in Halphen acid twice through the partition column, further purification was effected by six to ten crystallizations from cold acetone and petroleum ether. The concentration of the Halphen acid in the mixed fatty-acids of *Malva* spp. probably does not exceed 3 per cent.

While it is doubtful whether pure Halphen acid has yet been isolated, the richest fractions have yielded material with the following characteristics: Halphen colour reaction is just detectable at 10 p.p.m.; gentle heating of the acid, with or without alkali, rapidly abolishes the colour reaction; melting point, 10·3–10·5° C.; analysis, C, 77·4; H, 11·9 and O, 11·0 per cent (oleic acid, C, 76·5; H, 12·1; O, 11·3 per cent); iodine value[5], 110·3; apparent molecular weight 283 (oleic acid 282). The infra-red absorption spectra of the liquid acid showed a prominent band at 1,008 cm.$^{-1}$, which is believed to be characteristic of the *cyclo*propane ring[6]. Dijkstra and Duin[7] found that some oils giving the Halphen reaction also showed strong absorption at 1,009 cm.$^{-1}$.

In order to test whether fractions giving the Halphen test contained the biologically active component, 0·2 ml. of a chromatographic fraction rich in Halphen acid (more than 20 per cent) was fed every day for fifteen days to each of four laying hens. Similar amounts of pure oleic acid were fed daily to four control hens. All eggs from the control (oleic acid) pen were normal, whereas 71 per cent of the eggs from hens fed the Halphen acid showed typical pink-white disorder. Some typical results of chemical analyses are given in Table 1.

Table 1. Chemical Analyses of Control and Affected Eggs

Group of hens	pH		Yolk moisture content (per cent)	Iron (μgm./gm. white)	Non-protein nitrogen (mgm./gm. white)
	White	Yolk			
Before feeding					
1	8·72	6·70	51·5	0·31	0·071
2	8·71	6·66	51·6	0·33	0·076
During feeding					
1 Control eggs	8·57	6·46	51·7	0·22	0·078
2 Pink-white eggs	7·52	7·43	54·3	1·38	0·283

For the affected eggs, the results in Table 1 show increased moisture content of yolks, increased iron and non-protein nitrogen content of whites and convergence of the pH values of the whites and yolks. It was found that much higher concentrations of amino-acids occurred in the whites of affected eggs than in the controls. Halphen tests on yolk fat extracted from eggs with pink white were strongly positive in 1 : 10 dilutions and slightly positive in 1 : 100, whereas the control yolk fats were negative.

The rate of hæmolysis of sheep erythrocytes by the potassium soap of Halphen acid (concentration 100 p.p.m.) is three times faster than that produced by a similar concentration of potassium oleate. The Halphen acid may therefore have strong surface-active properties.

A fuller account of these investigations will be published elsewhere. They form part of the research programme of the Division of Food Preservation, Commonwealth Scientific and Industrial Research Organization.

Chromatographic Detection of Free Amino-acids in Normal and Iron-deficient Plants of *Hibiscus esculentus* L.

It has been reported that in iron-deficient plants there is observed an increase of the soluble forms of nitrogen, with a simultaneous decrease of its protein forms[1-3]. This observation was confirmed in the present work, on *Hibiscus esculentus* L., using the standard methods of chemical analysis. However, we have endeavoured to carry out a qualitative examination of the soluble fraction of nitrogen in normal and iron-deficient plants of this species by the application of paper chromatography.

For that purpose, 3–4 gm. of fresh material taken from 35-day old plants was carefully broken up in 80 per cent ethyl alcohol and the crude extract centrifuged for 15 min. at 4,000 r.p.m. The supernatant liquid was then separated by decantation and concentrated by evaporation until its volume was reduced to 1 c.c. From that concentrated extract 0·005 c.c. was used for each chromatogram. Two-dimensional ascending chromatography on Whatman No. 1 paper, 25 cm. × 25 cm. sheets, was adopted, with phenol as solvent for one direction and *n*-butanol/acetic acid/water (4 : 1 : 5) for the other. The position of amino-acids was located by spraying with ninhydrin reagent (0·1 per cent in acetone). The amino-acids were identified by comparing the spots appearing on the chromatograms with those produced by authentic compounds.

In Fig. 1 are shown two chromatograms : (*A*) from an iron-deficient plant ; (*B*) from a normal plant. With regard to the quantity of amino-acids involved, the greater concentration of these acids is clearly observed in the alcoholic extract of the iron-deficient plants, from the size as well as the intensity of the colour shown by the spots. The higher concentration of asparagine is especially remarkable. From the qualitative point of view, the iron-deficient plants contain phenylalanine, serine and probably glycine. Normal plants do not contain detectable amounts of these amino-acids. From the undetermined spots, two were common on both chromatograms, but were more intense on those prepared from iron-deficient plants. One spot appeared only on the chromatogram from iron-deficient plants, while three appeared on those from normal plants only. The location and colour of one of the last three spots coincide with those produced by cysteinic acid.

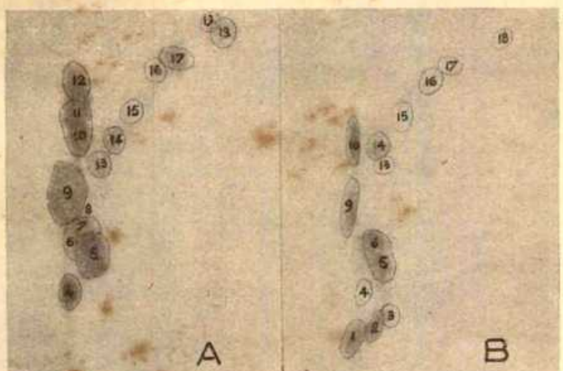

Fig. 1. Two-dimensional ascending paper chromatographs of alcoholic extracts of *Hibiscus esculentus* L. tissue. (*A*) From an iron-deficient plant ; (*B*) from a normal plant.
1, 2, 3, 4, 12, 13, Unidentified spots ; 5, aspartic acid ; 6, glutamic acid ; 7, serine ; 8, glycine (?) ; 9, asparagine ; 10, arginine ; 11, glutamine ; 14, α-alanine ; 15, β-alanine ; 16, tyrosine ; 17, valine ; 18, leucine(s) ; 19, phenylalanine

From these observations, it becomes evident that the difference in the amino-acid content of normal and iron-deficient plants is not only quantitative but also qualitative.

Further details of this work will be published elsewhere.

Chemical Nature of Nucleic Acids in Cyanophyceae

The available information regarding the chemical nature of nucleic acids in Cyanophyceae is very meagre, and deoxyribonucleic acid and ribonucleic acid have not been isolated chemically from this group. As the blue-green cell is peculiar in its nuclear structure, the chemical nature of its nucleic acids may be different in kind or degree from that of other sources. With this in view, the nucleic acids were isolated from *Nostoc muscorum* using the conventional method of Schmidt and Thannhauser as modified by Heinrich *et al.*[1].

The deoxyribonucleic acid separated from *Nostoc muscorum* gives a positive test with the Dische reagent, indicating the presence of deoxypentose-sugar. Chromatographic analysis of the hydrolysate according to the procedure of Wyatt[2] revealed only three spots of bases, corresponding to guanine, adenine and cytosine, but thymine could not be detected. Magee and Burris[3] showed in experiments on nitrogen fixation by *Nostoc muscorum* that incorporation of nitrogen-15 in thymine is much less than that of other nitrogenous compounds. It is possible that the thymine in deoxyribonucleic acid is present in too small an amount to be detected on the chromatogram, and hence application of carbon-14 as a tracer might help its detection. Carbon-14 dioxide was therefore passed through a *Nostoc* suspension in phosphate buffer at *p*H 7 for 6 hr. in presence of light. After the experiment, the suspension was extracted with 80 per cent ethanol, alcohol–ether (3 : 1) and finally with ether only, and deoxyribonucleic acid was precipitated by the procedure referred to above. A radioautograph revealed the spot corresponding to thymine. Added thymine co-chromatographed with the thymine eluted from the radioactive spot. Thus deoxyribonucleic acid in Cyanophyceae is similar in kind to that from other sources, which also support the earlier observations from cyto-chemical work[4] and with the electron-microscope (Singh, R. N., personal communication).

Ribonucleic acid which was precipitated from the deoxyribonucleic acid filtrate by alcohol gave a positive reaction in the orcinol test, indicating the presence of pentose sugar. Chromatographic analysis following the method of Smith and Markham[5] gave four spots corresponding to guanine, adenine, cytidylic acid and uridylic acid. Thus the ribonucleic acid of Cyanophyceae shows no qualitative deviation from the normal type.

Further studies, with carbon-14 and phosphorus-32, on the turnover of nucleic acids in Cyanophyceae are now in progress.

Thanks are due to Dr. D. M. Bose, director of the Bose Institute, for his interest in this work and to Dr. S. K. Roy and Dr. S. P. Sen for suggestions and criticisms.

Culture of Tubal Mouse Ova

TUBAL mouse ova at the eight-cell stage developed consistently to blastulæ, when cultured in the egg white – saline mixture used by Hammond[1] for the actual collection of ova. This fluid was freshly prepared each day and kept in tightly stoppered vessels. Unlike that of Hammond, the *p*H was about 7·0; but this rapidly rose to 7·8 during measurement with a glass electrode or when exposed in shallow vessels, and the change was attributed to loss of carbon dioxide contained in the egg white. Since ova failed to differentiate at a *p*H greater than 7·7, Krebs–Ringer bicarbonate[2] (*p*H 7·4), with 10 γ/ml. penicillin and streptomycin, was adopted as the standard saline medium. With the addition of 1 per cent fresh thin egg white, this proved an excellent culture medium for the ova, but no growth was obtained in the Krebs–Ringer bicarbonate alone.

The essential factor or factors in egg white were shown to be non-dialysable, but an attempt to identify them with one or more of the protein fractions of egg white was unsuccessful. However, normal growth was obtained with Krebs–Ringer bicarbonate plus crystalline bovine albumin (Armour and Armour) in concentrations ranging from 0·03 to 6 per cent, and this preparation was used in all subsequent observations.

Mice were killed on the third day after mating and the ova obtained by inserting a 28-gauge hypodermic needle at the uterine end of the oviducts, and flushing them out into a cavity slide with about 0·5 ml. of the medium. The ova were then collected in about 0·3 µml. of fluid, with as little tubal debris as possible, in a mechanically controlled pipette. They were transferred to a second cavity slide containing 1 ml. of medium, the contents agitated, and the ova again collected with a fresh pipette and transferred to an agglutination tube containing 1 ml. of fluid. This was tightly stoppered and incubated in a water bath at 37° C. After 48 hr. the contents were tipped on to a cavity slide and examined.

Using this technique, only three out of 148 ova failed to develop into blastulæ when cultured in 0·4 per cent bovine albumin in batches of 10–14, and 86 out of 87 developed when the concentration was 0·1 per cent. These blastulæ appeared normal and produced characteristic growth when inserted under the kidney capsule of mice.

It is unlikely that tubal cells or secretions transferred to the culture tubes with the ova played any part in growth, since development continued even if the washing procedure described above was repeated ten times.

The mode of action of the albumin is not clear. It did not appear to function by preventing extraction of any component of the ova, since they failed to grow in Krebs–Ringer bicarbonate containing 200 ova/ml. which had been ruptured by alternate freezing and thawing. However, it did alter the physical properties of the medium and greatly facilitated the manipulation of the ova with a pipette, as those in Krebs–Ringer bicarbonate alone adhered to the glass. So far it has been shown that the omission of calcium, magnesium, potassium or glucose from the Krebs–Ringer bicarbonate prevented growth, and development was delayed without phosphate. Growth occurred only between *p*H 6·9 and 7·7 and continued when the molarity was reduced to 0·09.

I acknowledge the generous help given by members of the Department of Biochemistry of this University.

Microbiology of Silage

ALTHOUGH several investigators have studied the micro-organisms present in silage, the various types of organisms and the number of each found in different qualities of silage are rarely given. Preliminary results of a study of the micro-organisms present in grass silage made in four different ways may therefore be of interest.

The silage was made in glass tubes in a manner similar to that described by Allen *et al.*[1], 40 gm. of the grass mixture—perennial ryegrass and white clover—being mown and after treatment being packed into tubes 6 in. × 1 in., care being taken that all the implements used had been previously sterilized. Each tube was immediately closed with an air-tight stopper, and stored at ordinary laboratory temperature for seven weeks, after which the tubes were opened and their contents examined for colour and smell as well as bacteriologically.

Four contrasting treatments were adopted as follows: (*A*) the grass was packed without chopping and without the addition of any water or preservative; (*B*) the grass was chopped into inch lengths but packed without the addition of any water or preservative; (*C*) the grass was left unchopped but sprinkled with sterile water before packing; (*D*) the grass was left unchopped but was well mixed with 0·2 gm. of sodium metabisulphite in powdered form before being packed into the tube.

The silage from treatment (*A*), though made without the addition of any preservative, was still green and had kept well. A slight aroma of a pleasant nature had developed; otherwise the condition of the grass appeared almost identical with what was originally put in. In fact, it was considered the best-preserved of all the four methods. In treatment (*B*) the silage was fairly similar in appearance to that in treatment (*A*), but it had a slightly objectionable smell. In treatment (*C*), the silage turned slightly brown after a few days and when opened it smelt strongly of butyric acid; it was deemed the poorest of all the four silages. In treatment (*D*) the grass had kept well and had a pleasant aroma, but it had developed an unnatural shade of green—a bright

Table 1. *p*H AND LOGARITHM OF THE NUMBER OF BACTERIA PER TUBE* IN THE GRASS WHEN FRESH AND AFTER SEVEN WEEKS IN EACH OF THE FOUR TREATMENTS

	Treatment of grass	*p*H	Total bacteria	Lacto-bacilli	Coli-forms	Anaerobic spore formers
	Fresh	6·2	8·9	0·5	4	3
A	Packed as mown	4·5	7·9	7·4	0	0
B	Packed after chopping	4·1	9·8	7·7	0	0
C	Packed after being sprinkled with sterile water	5·6	7·2	6·2	7	6
D	Packed after addition of sodium metabisulphite	5·4	4·0	1·7	3	0

* Each tube contained 40 gm. of fresh grass.

green as compared with treatment (*A*), which had retained the normal fresh green.

In the bacteriological examination the contents of each tube were ground up with sterile sand, and, by dilution, counts were made of the following: the total number of bacteria growing at 30° C. on tryptone glucose-yeast extract agar[2]; lactobacilli on Rugosa's medium at 37° C.[3]; anaerobic spore-forming bacteria in Robertson's cooked meat medium at 30° C.; and coliforms in MacConkey's bile salt broth at 30° C.

Table 1 shows that, comparing the four silages with the fresh grass, there has been a distinct change in the pattern of distribution of the bacterial flora, much more so than in the total number of organisms. The total number of bacteria and the number of lactobacilli were considerably lower in the metabisulphite treatment than in any of the other treatments. The number of coliform bacteria, however, had not been reduced to the same extent. Excess of water (treatment *C*) tends to encourage the coliforms and also the anaerobic spore formers—both undesirable developments. On the other hand, treatments (*A*) and (*B*)—packing without surplus water—have reduced both these developments while at the same time they have favoured the development of the lactobacilli.

Two features stand out here in connexion with the lactobacilli. In the first place, the low number of lactobacilli present in the fresh grass; this is typical of all samples of fresh grass encountered in this work. Secondly, it will be seen that the acidity had developed to a further degree where neither water nor sodium metabisulphite had been added. In these two treatments (*A* and *B*) the lactobacillus had not only increased very considerably but also had become the dominant organism.

These and other results on the microbiology of different silages will be reported in a future publication, when it is hoped to relate the figures found in tube silage to those obtained from similarly treated silage made in ordinary silos. This work is being carried out during the tenure of a Sir James Knott Fellowship; I wish to thank Prof. Martin Jones for his interest and advice.

'Solubilized' Chemicals for the Control of Plant Nematodes

Staniland and Stone[1] have described the use of 'solubilized' chemicals as nematicides. Laboratory work has been continued by Miss J. K. Bartlett with the aid of a grant from the Agricultural Research Council, and some other aspects of the problem are being studied by Mr. L. E. W. Stone. I have given particular attention to the control of potato eelworm in glasshouse soils. Control of potato root eelworm of a high order has been obtained by watering infested soil with a large volume of various 'solubilized' chemicals. Volumes to the extent of one gallon per square foot are necessary, and care is required in application in order to avoid 'ponding', with consequent uneven wetting of the soil and contained eelworm cysts. Cysts not killed are mainly to be found at the lower depths where soil and cysts are wetter. 'Solubilized' chemicals work best in the higher and dryer levels of the soil, where fumigants are least effective since the drier and more aerated soil does not permit a sufficient concentration of vapour to be retained.

It occurred to me that an efficient economic control of potato root eelworm under glass could probably be achieved by a combination of both methods. It has been found that an injection with DD (dichloropropylene dichloropropane) at the usual rate of 400 lb. an acre can be followed by application of a sufficient volume of 'solubilized' chemical to wet the top 2–3 in. of soil, the amount of liquid for this purpose being 2 gallons a square yard. This treatment has now been tested under commercial glasshouse conditions and has given excellent results.

Dr. B. G. Peters, then head of the Department of Nematology, Rothamsted Experimental Station, very kindly undertook a laboratory experiment whereby the effects of nematicides could be studied in separate 2-in. layers of soil to a depth of 12 in. In this way it was possible to investigate the effects of the two chemicals separately and together. Dr. Peters has shown that the two treatments behave independently and that in combination they are effective. A paper describing this work has been published[2].

The combined DD injection, followed by the application of a nematicidal 'seal', is simple and quick in practice and compares favourably with steam sterilization in efficiency, time and cost. The chemical which has been found most suitable for solubilization, with due regard to nematicidal efficiency and low cost, is a commercial xylenol fraction. The most suitable detergent for effecting solubilization is a commercial brand of the long-chain alkyl sulphate type. It is clear that there is much scope in the use of a variety of tar-distillates; and the finding of even cheaper materials, particularly if cheaper detergents were forthcoming, might well extend the use of the method to open land, particularly in connexion with some of the more profitable crops.

A full account of this work will be published elsewhere.

Arresting *Paramecium*

VARIOUS devices are employed in an effort to slow down the movements of *Paramecium* for the benefit of first-year students. It seemed worth while to report that the so-called cellulose adhesives are very successful indeed.

The material was prepared from 'Stadex C.A.', a commercial product intended for the use of decorators. Movement was slowed to a convenient rate in a 0·15 per cent solution, and one twice this strength was also useful for demonstrating the twisting and turning movements of which the animal is capable. The animals look perfectly normal in the solutions and their movement is normal though slowed; they are apparently unharmed and have survived for more than two months.

I am given to understand that 'Stadex C.A.' is sodium carboxy methyl cellulose. The results should therefore not have been unexpected, for methyl cellulose has already been used successfully[1]; but as its use does not appear to be widely known, it was thought that the present observations would be of value.

Use of Gold Sols as an Aid to focusing in High-Resolution Electron Microscopy

ALTHOUGH electron microscope contrast may be increased by the use of objective apertures, accurate focusing in thin-section work is still difficult and, in order to obtain an in-focus picture of a particular field, it is very helpful to find a small dense particle, or a hole in the membrane, on which to focus. An obvious solution to this problem is to distribute small dense particles on the specimen.

Birch-Andersen *et al.*[1] have tried using carbon black, but the method is open to two objections: (1) large masses must be deposited on the specimen, and (2) even if only single particles are present, it is necessary to focus slightly off the particle to get an in-focus picture of the section, since the diameter, or edge, of the particle is at a different focal level. This effect is of importance, however, only towards the limit of resolution.

We decided that a gold sol might provide particles of useful size and density. Fortunately, it is easy to make gold sols in a wide range of particle sizes. We have found that particles of 130–150 A. diameter are very useful for focusing at a magnification of 9,000; for higher magnifications, smaller particles would be useful.

Turkevich, Stevenson and Hillier[2] described a method of making gold sols in a range of particle sizes. The method (reduction of acid gold chloride, 95 ml. of which contained 5 mgm. of gold, with 1 per cent sodium citrate at 60–100° C. depending on the particle size required) is easy, and yields sols with a very small scatter of particle diameter—the standard deviation of the distribution is about 10 per cent. We diluted the sol 1 in 10 and put drops on mounted sections, left them for 10 min., and then drained off as much as possible. The particles were rather more evenly spread over the specimen if the sol was put on the 'Formvar' membranes before mounting the sections.

We have found that gold sols, prepared in this way, have several advantages: (1) they are extremely dense and give very good images when in focus; (2) they are so uniform in size and their density is so great that they are unlikely to be confused with any tissue components; (3) the size of the particles and their number on the specimen can be varied to suit any particular purpose.

Quotation of Titles of Papers in Review Articles

As one of the contributors to the "International Review of Cytology", vol. 3, reviewed in *Nature* of October 8 (p. 664) by Dr. D. R. Newth, I should like to direct attention to certain facts. Dr. Newth concludes his review with the words: "The reviewer of Vol. 1 pleaded for titles of papers to be given in the lists of references. If a reminder will strengthen the editors' hands in forcing this reform upon unwilling authors, it is gladly given".

My review was submitted with a bibliography including full titles, and I strenuously urged the publishers to include them. The following is a quotation from a letter from me to the publishers, dated March 29, 1954: "In a letter to Dr. Bourne [one of the editors] last year, I quoted the review of Dr. E. N. Willmer in 'Nature', in which he strongly deplored the omission of titles of papers referred to in the IRC. A very great deal of the value of any review article is lost if the full bibliography is omitted, and I would have wished to place this review elsewhere had I thought that this grave and short-sighted defect was to be repeated in vol. III. I feel most strongly that the main use of most reviews lies in the bibliography; many of the references I quote are of little use to the reader if he cannot refer to their titles easily, and would not have been included had I known that the titles were to be cut out".

The publishers replied on April 7, 1954: "With respect to the omission of titles of papers, we regret that we will be unable to insert them. It is our house style and also the style of this series, and we have found that on the rare occasions when we have made exceptions we have had unfavorable comments from reviewers concerning the inconsistency. We hope that you will not find this unreasonable".

The editors' hands indeed need strengthening; but not against unwilling authors.

FORTHCOMING EVENTS

(*Meetings marked with an asterisk * are open to the public*)

Monday, January 16

Bone and Tooth Society (at the Institute of Orthopædics, 234 Great Portland Street, London, W.1), at 5 p.m.—Scientific Papers.

Institution of Electrical Engineers (joint meeting with the Institution of Civil Engineers and the Institution of Mechanical Engineers, at the Institution of Mechanical Engineers, 1 Birdcage Walk, Westminster, London, S.W.1), at 5 30 p.m.—Meeting on "Advanced Courses for Engineers in Industry".

Manchester Literary and Philosophical Society (in the Lesser Free Trade Hall, Manchester), at 5.45 p.m.—Mr. Max Beloff: "Benjamin Franklin: International Statesman" (Franklin Memorial Lecture).

Institute of Metal Finishing (joint meeting with the Institute of Sewage Purification, at Imperial College, South Kensington, London, S.W.7), at 6.15 p.m.—Mr. A. E. J. Pettet: "The Effects of Metal Finishing Wastes on Sewage Purification".

British Psychological Society (in the Psychology Department, Birkbeck College, Malet Street. London, W.C.1), at 8 p.m.—Mr. N. S. Sutherland: "Visual Discrimination in Octopus".

Tuesday, January 17

University College, London (in the Anatomy Theatre, Gower Street, London, W.C.1), at 1.15 p.m.—Dr. H. Kalmus: "A Biologist's Impressions of Brazil".*

University of London (at King's College, Strand, London, W.C.2), at 5.30 p.m.—Prof. B. Folkow (Gothenburg): "Quantitative Aspects of some Mechanical, Nervous and Humoral Factors Controlling the Cardiovascular System".*

Scientific Film Association (in the Mezzanine Cinema, Shell-Mex House, Strand, London, W.C.2), at 6.30 p.m.—Mr. R. Ollerenshaw: "The Use and Abuse of Film in Medical Illustration".

Royal Aeronautical Society (at 4 Hamilton Place, London, W.1), at 7 p.m.—Dr. W. Deck: "Crack Detection in Aircraft Structures".

Wednesday, January 18

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Prof. E. N. da C. Andrade, F.R.S.: "Benjamin Franklin in London" (Trueman Wood Lecture).

Physical Society, Colour Group (at Imperial College, Prince Consort Road, London, S.W.7), at 3.30 p.m.—Mr. J. M. Adams: "Colour Half-Tone Printing".

British Glaciological Society (joint meeting with the Royal Meteorological Society, at 49 Cromwell Road, London, S.W.7), at 5 p.m.—Meeting on "Snow Accumulation and Ablation".

Royal Statistical Society (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W.C.1), at 5.15 p.m.—Prof. E. S. Pearson, C.B.E.: "Some Aspects of the Geometry of Statistics: The Use of Visual Presentation in Understanding the Theory and Application of Mathematical Statistics" (Presidential Address).

British Nuclear Energy Conference (in the Great Hall of the Institution of Civil Engineers, Great George Street, London, S.W.1), at 5.30 p.m.—Mr. W. B. Hall and Mr. T. I. M. Crofts: "The Use of Sodium and Sodium Potassium Alloy as a Heat-Transfer Medium".

Eugenics Society (at the Royal Society, Burlington House, Piccadilly, London, W.1), at 5.30 p.m.—Symposium on "The Personality Characteristics of Parents of Promising Children". Speakers: Miss Elizabeth Tylden, Miss Mildred Creak and Mr. S. G. Singleton.*

Institute of Fuel (joint meeting with the Coke Oven Managers' Association (Southern Section), at the Waldorf Hotel, Aldwych, London, W.C.2), at 5.30 p.m.—Mr. L. J. Clark: "Steam and Power in the Gas and Coking Industry".*

Royal Institute of Chemistry, London Section (joint meeting with the London Section of the Society of Chemical Industry, at the Institute of Metals, 4 Grosvenor Gardens, London, S.W.1), at 6 30 p.m.—Dr. H. J. Plenderleith: "Science in the Service of Archæology".

Oil and Colour Chemists' Association, London Section (at the Royal Society of Tropical Medicine and Hygiene, Manson House, 26 Portland Place, London, W.1), at 7 p.m.—Mr. M. R. Mills: "The Selective Hydrogenation of Tung Oil".

Thursday, January 19

University College, London (in the Anatomy Theatre, Gower Street, London, W.C.1), at 1.15 p.m.—Dr. D. J. Stenning: "Following the Clouds: Sudanese Nomadism".*

Physical Society, Optical Group (in the Physics Department, Imperial College, Imperial Institute Road, London, S.W.7), at 2.30 p.m.—Scientific Papers.

Institution of Mining and Metallurgy (at the Geological Society of London, Burlington House, Piccadilly, London, W.1), at 5 p.m.—Mr. H. A. Graves: "A Decade of Progress in Canadian Mining (1945–1954)—Part 2".

Linnean Society of London (at Burlington House, Piccadilly, London, W.1), at 5 p.m.—Dr. R. W. Butcher: "Marine Microflagellates—a Long Overlooked Ecological Group"; Miss P. Lamplugh Robinson: "The Mesozoic Fissures of the Bristol Channel Area and Their Vertebrate Faunas".

London Mathematical Society (at the Royal Astronomical Society, Burlington House, Piccadilly, London, W.1), at 5 p.m.—Dr. K. F. Roth: "Rational Approximations to Algebraic Numbers".

Society of Chemical Industry, Road and Building Materials Group (in the Lecture Hall, Junior Institution of Engineers, Pepys House, 14 Rochester Row, London, S.W.1), at 6 p m.—Meeting on "The Use of Pulverised-Fuel Ash". Mr. B. Butterworth: "Brick Making"; Mr. W. Kinniburgh: "Light-Weight Aggregate".

Chemical Society (in the Large Chemistry Lecture Theatre, Imperial College of Science and Technology, South Kensington, London, S.W.7), at 7.30 p.m.—Dr. G. W. Kenner: "Recent Progress in the Chemistry of Peptides" (Tilden Lecture).

Royal Society of Tropical Medicine and Hygiene (at Manson House, 26 Portland Place, London, W.1), at 7.30 p.m.—Symposium on "The Treatment of Human Amoebiasis". Opening Speakers: Prof. A. W. Woodruff and Dr. A. R. D. Adams. Chairman: Prof. R. M. Gordon.

Friday, January 20

British Society of Rheology (at the Institute of Physics, 47 Belgrave Square, London, S.W.1), at 9.45 a.m.—Symposium on "Rheology of Proteins".

British Society for Research on Ageing (in the Littlewood Hall, The General Infirmary, Leeds), at 2.30 p.m.—Meeting on "Connective Tissue and its Changes With Age".

Royal Astronomical Society (at Burlington House, Piccadilly, London, W.1), at 4.15 p.m.—Geophysical Discussion—"Irregular Changes in the Rotation of the Earth". Chairman: Sir Harold Spencer Jones, F.R.S. Speakers: Mr. T. Gold, Dr. W. H. Munk and Prof. S. K. Runcorn.

Institute of Navigation (at the Royal Geographical Society, 1 Kensington Gore, London, S.W.7), at 5 p.m.—"Some Meteorological Aspects of High-Level Navigation". (1) Captain B. C. Frost: "Jet Streams in Flight"; Mr. J. K. Bannon and Mr. T. H. Kirk: "Forecasting Jet Streams".

Institution of Mechanical Engineers (at 1 Birdcage Walk, Westminster, London, S.W.1), at 5.30 p.m.—Mr. A. W. Davis: "Marine Reduction Gearing" (Thomas Lowe Gray Lecture).

Society of Chemical Industry, Fine Chemicals Group (in the Chemistry Lecture Theatre, King's College, Strand, London, W.C.2), at 7 p.m.—Mr. E. Chadwick: "Solvents in the Chemical Industry".

Saturday, January 21

Biochemical Society (at the Postgraduate Medical School of London, Ducane Road, London, W.12), at 2 p.m.—Scientific Papers.

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Assistant Lecturer in Mechanical or Production Engineering, Assistant Lecturer in Mathematics, Demonstrator in Mechanical Engineering, and a Demonstrator in Electrical Engineering—The Principal, Royal Aircraft Establishment Technical College, Farnborough, Hants (January 18).

Scientific Officer (with a first- or second-class honours degree or equivalent in physics or chemical engineering) with the Ministry of Supply at Waltham Abbey, Essex, for research on heat transfer phenomena at high temperatures—The Ministry of Labour and National Service Technical and Scientific Register (K), 26 King Street, London, S W.1, quoting A.458/5A/VD (January 21).

British Coke Research Association Fellow (honours graduate in chemistry, physics or applied science relating to fuel technology) to work on the physical chemistry of carbon under the direction of the Professor of Chemistry—The Registrar, King's College, Newcastle-upon-Tyne (January 31).

Chair of Education—The Registrar, University College, Singleton Park, Swansea (January 31).

George Angus Student (graduate of an approved university or holder of approved qualifications) for research in the Department of either Chemistry, Physics or Mechanical Engineering—The Registrar, King's College, Newcastle-upon-Tyne (January 31).

Lecturer (with qualifications in theoretical physics) in Physics—The Secretary, Queen's University, Belfast (January 31).

Professor of Heat Engines—The Dean, Faculty of Engineering, Cairo University, Giza, Egypt (February 1).

Senior Lecturer in Education at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, February 4).

Assistant Lecturer in Histology in the Department of Physiology and Histology—The Registrar, The University, Liverpool (February 6).

Lecturer in Fuel Technology in the Department of Chemical Engineering—Head of the Chemical Engineering Department, Imperial College, London, S.W.7 (February 6).

Lecturer or Assistant Lecturer (with some experience in any of the branches of electrical engineering) in the Department of Electrical Engineering—The Registrar, The University, Manchester (February 11).

Director of Research—The Secretary, British Scientific Instrument Research Association, Sira, South Hill, Chislehurst, Kent (February 14).

Assistant Lecturer (honours graduate) in Zoology—The Secretary, Bedford College (University of London), Regent's Park, London, N.W.1 (February 15).

Reader in Aeronautics at the Imperial College of Science and Technology—The Academic Registrar, University of London, Senate House, London, W.C.1 (February 16).

Lecturer in the Department of Aeronautical Engineering—The Registrar Queen Mary College (University of London), Mile End Road, London, E.1 (February 21).

Lecturer in Astronomy—The Registrar, The University, Manchester 13 (February 28).

Imperial Chemical Industries Research Fellows in Biochemistry, Chemistry, Engineering, Pharmacology or Physics—Secretary of University Court, The University, Glasgow (February 29).

Lecturer in Anatomy—The Secretary, The University, Aberdeen (March 1).

Assistant Director (with a good science degree and a knowledge of research in nutrition, and preferably proficient in foreign languages, and experience overseas) of the Commonwealth Bureau of Animal Nutrition, Rowett Research Institute, Aberdeenshire—The Secretary, Commonwealth Agricultural Bureaux, Farnham Royal, Bucks (May 31).

Aerodynamicist (with a first- or second-class honours degree in physics, mathematics or engineering) at the Ministry of Supply Headquarters, London, for assessment of civil aircraft projects for commercial operations, including estimation of aircraft performance during take-off, landing and in flight—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting C.952/5/AA.

Assistant (preferably with a biological degree and bibliographical experience, and with some knowledge of German) to prepare a journal comprising an annual record of the contents of entomological publications—Commonwealth Institute of Entomology, 56 Queen's Gate, London, S.W.7.

Associate Professor of Mathematics—Dean W. H. Johns, Faculty of Arts and Science, University of Alberta, Edmonton, Alberta, Canada.

Engineer or Physicist (with a first- or second-class honours degree or equivalent, and keen on practical as well as theoretical work) in the Instrumentation and Photographic Department of the Royal Aircraft Establishment, Farnborough, Hants, for work on development of new and adaptation of existing aircraft automatic pilots—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting D.620/5A/AA.

Head of the Science Department, Grade II—The Registrar, Hatfield Technical College, Roe Green, Hatfield, Herts.

Master to teach Chemistry up to "A" level—The Headmaster, Worksop College, Notts.

Principal Scientific Officer (with a first- or second-class honours degree in physics and considerable experience in electronic techniques), to co-operate with Nuclear Physicists in the design of specialized equipment and circuitry required in nuclear physics experiments with particle accelerators, and to supervise its construction—The Senior Recruitment Officer, Atomic Weapons Research Establishment, Aldermaston, Berks, quoting 857/34.

Scientific Officer (with a first- or second-class honours degree or equivalent in electrical engineering or physics with a bias towards electronics, and preferably with previous experience of airborne radar systems) at a Royal Air Force Establishment in Norfolk, for development and adaptation of radio equipment pulse techniques, including aerials, power supplies and displays—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting D.598/5A/AA.

Senior Technician to take charge of Aerobic Vaccine Production and Media Making—The Head, Bayer Biological Institute, Beechwood House, 44 Church Street, Exning, near Newmarket, Suffolk.

Technician (with experience in clinical biochemistry or in biochemical research) in the Clinical Research Laboratory—The House Governor, Royal Marsden Hospital, Fulham Road, London, S.W.3.

BROADCASTING, TELEVISION AND CURRENT AFFAIRS

THE directive issued by the Postmaster-General on July 27, 1955, to the British Broadcasting Corporation, and also to the Independent Television Authority, restraining either body from arranging to broadcast discussions or *ex parte* statements on issues within a fortnight of their debate in the Houses of Parliament, or while the issue is being debated, has been the subject of repeated questions in Parliament during the past few months. This directive, known as the fourteen-day rule, also vetoes broadcasts by any member of Parliament on any subject of legislation in the period between the introduction of the legislation and the time when it either receives the Royal Assent or is previously withdrawn or dropped. It has also been much discussed in the Press prior to the full debate on broadcasting anticipation of Parliamentary debates which, in deference to growing pressure, the Government arranged on November 30.

It was stated by the Prime Minister on October 25 that the directive imposes no new restrictions upon broadcast discussion, but requires conformity to a practice followed, in its present form, by agreement between the British Broadcasting Corporation and the major political parties since 1948. As explained, however, by the Postmaster-General in opening the debate, by 1953 the Corporation was dissatisfied with the situation and suggested that it alone should assume responsibility for deciding what subjects should be discussed. It did not, as the Corporation's annual report for 1954–55 shows, challenge the principle that broadcasting should not be allowed to encroach on the position of Parliament as the supreme forum for the discussion of public issues. It did, however, insist that if the rule was to be continued, it should be in the form of a directive on the Government's responsibility.

It was clear from the speech of the Postmaster-General that what most concerns the Government is the immense power of broadcasting, including television, over the minds of men. The fear that this power to influence public opinion may undermine or discount that of a political party inclines those in power to overlook the importance of examining the potentialities of such a new medium, of welcoming the opportunities of educating public opinion which it offers and determining the ways in which those opportunities can be most wisely and effectively used to widen the boundaries of public discussion, argument, knowledge and criticism. The Postmaster-General, it is true, admitted that broadcast discussion differs from discussion in Parliament or in public meetings generally. It differs also from discussion in the Press, and these differences in the technique required have more influence than most speakers in the debate were inclined to admit on the selection of broadcasters, whether or not they be members of Parliament. If the full advantages of broadcast discussion are to be realized, the choice of speakers must depend on their broadcasting ability and not primarily on their Parliamentary reputation or their standing with a party caucus.

The most disappointing feature of the debate was, however, the failure of any of the Government spokesmen to show any appreciation of those factors in the situation to which Sir William Haley, for example, directed attention in his Clayton Memorial Lecture in Manchester in March 1954. There was no evidence that broadcasting and television are regarded as in any sense instruments of education (at least by a majority of listeners), or of the urgent need for positive measures to counteract their erosion, for example, of standards of literacy. It is not the slender reporting of Parliamentary debates in the Press or the prior broadcasting discussion of the subjects of debate that undermines the prestige and authority of Parliament; there has always been such public discussion of live issues in the Press and in the streets and clubs and other places where people meet; rather the political party machine has reduced the significance of Parliamentary debate by making its issue a foregone conclusion.

One of the gravest blows struck at the dignity and prestige of Parliament is the disappearance of the independent member, and Sir Robert Boothby rightly reminded the House that it is its own actions rather than those of any other body that can detract from or uphold its dignity. So far from public discussion on parliamentary issues outside the House destroying the reality of Parliamentary debates, members down the centuries have relied on the cut and thrust of such debates to give vitality to their own arguments. It is true that there are occasions when restraint is called for and when broadcast discussion may be inexpedient, just as there are occasions when discussion in the Press is undesirable. If, however, sections of the Press fail to exercise the restraint which decency and the public interest dictate, the remedy lies rather with the public itself than in the imposition of a censorship.

Quoting Lord Beveridge's words, "No argument of merit can justify stifling the discussion of public issues at the moment when discussion is most opportune", Sir Robert Boothby said that Parliament should welcome free discussion as a guide to what people are thinking and how they feel. It is true that there is not quite the same alertness in broadcast debate as in a public meeting, but only the most superficial observer can fail to notice how quickly errors are noticed and how firmly opinions are challenged. There is little doubt that Sir Robert is right in suggesting that 'front bench' politicians over-estimate the power and influence of the medium.

Although the debate ended with the adoption of the Postmaster-General's motion, accepting the principle of some limitation to the anticipation of Parliamentary debates by broadcasting, and welcoming the appointment of a Select Committee to consider whether any changes are desirable in the ways in which effect is given to this principle, it became quite clear that many members of all parties feel strongly that party leaders are attempting to keep far too tight a hand on public discussion out of Parliament. At least it was recognized that fourteen days is much too long a period for any such restraint to be maintained, and from all sides the absurdities into which the present rule might lead were freely emphasized. It was indeed contended by Mr. M. Edelman that the motion was in effect an admission that the rule is unworkable. It is to be hoped that the Select Committee will speedily arrive at some sensible proposals which, while indicating where restraint or reticence is appropriate, will safeguard the vital principle of free public discussion and the right of members of Parliament to speak their minds outside as well as within the House of Commons.

These matters concern all who are interested in seeing that the full potentialities for good of broadcasting and television are utilized, in education, in science, and elsewhere. The debate on November 30 should perhaps dispose of the idea that Parliament is, or ever was, the main forum of public discussion. It also indicated the danger of any attempt to curb controversy by some mathematical adjustment to the composition of the House of Commons, a danger which is brought out vividly in the lively attack on monopoly and the political party caucus which Mr. John Irwin has launched in his witty but provocative little book, "My Time is My Own"*. In an outspoken plea for free speech and for alternative broadcasting programmes, he shows clearly how fatal to entertainment and to public education alike subservience to the susceptibilities of the political party machines can be. If democracy means anything at all, he argues, it means trusting the people to think and decide for themselves; and if television and broadcasting are to be effective and present all major public issues competently, the deciding factor must be the appropriateness and efficiency of the programme and broadcaster for the task to be done.

Mr. Irwin's rather slight little book is worth reading for the evidence it supplies of the importance of securing vitality in broadcasting. It should be obvious that if the full opportunities which open discussion affords of enabling people to understand the real issues involved in matters of public policy are to be used, it can only be while the matter is of live interest and engaging the attention of Parliament. When it has been settled by Parliament, it may no longer hold the attention of the public, and the opportunity of explaining some of the factors that have determined government action may have been missed. This can be particularly important in respect of the technical and scientific factors involved in public policy. Even with the aid of the Parliamentary and Scientific Committee, we cannot assume that the exposition in Parliament is at present, or will be in future, such that members of Parliament fully appreciate the significance of such factors or are able to bring them out in debate.

Under the present fourteen-day rule, however, a valuable means of correcting this weakness and enlightening public opinion is lost. Atmospheric pollution, the development of nuclear energy, the hydrogen bomb and the hazards from test explosions, water supply, the preservation of the countryside, transport—on all these and many other topics expert opinion is more likely to be found outside Parliament than within, and it might be difficult for effective warning of the dangers of some proposed action to be given until too late, for we have to reckon with the possibility of the Press reaching a diminishing audience. Much more use in fact should be made of broadcasting and television as a means of raising the standard of public understanding of scientific and technical matters, and more thought and experiment are required as to the appropriate techniques to be used for this purpose. These will obviously differ according to the type of audience or viewer to be approached. The House of Commons debate showed, indeed, that several members appreciate how the fourteen-day rule could operate to discourage or prevent the education of the public in this way.

On the Government side at least, there was no attempt to distinguish between propaganda and educational broadcasting. Yet even in the political field, the distinction can be drawn; and in fact it must be made if broadcasting is to be used as an educational instrument. What must be recognized, however, is that the choice of broadcasters and the nature of the broadcast should be determined objectively solely in relation to the purpose to be served. Any attempt to subject the content of the broadcast or the choice of broadcaster to the predilection of a particular political party would be fatal.

In one respect the observations on the influence of broadcasting on the modern child, made in the study of the influences affecting the upbringing of young people recently conducted by the Council of King George's Jubilee Trust, are reassuring. Indeed, despite the growth of radio and television, the working party which inquired into the period of full-time attendance at school thought that the printed word remains the most widespread and influential medium affecting the child of school age and was more concerned with the raising of standards in the Press. In view of the inquiry into the influence of television on children and young people generally, now being conducted by the Nuffield Trust, the working party concerned with the influences of leisure time after leaving school did not consider television specifically; nevertheless, the report suggests that, hitherto, radio and television in Great Britain have maintained a good standard. While, however, the influence on juveniles of adult films, newspapers and radio programmes is often exaggerated, there is much evidence that their cumulative effect on standards of taste and values is considerable. It will be remembered that Sir William Haley stressed the dominant influence of British broadcasting on manners, but he was equally concerned as to the effect of television upon the very possibility of educational broadcasting.

The function of broadcasting as an incidental result of the maintenance of high standards, or pursued as a definite objective in the Third Programme or in other ways, was strongly emphasized by the Beveridge Committee. It may be recalled that the majority itself was convinced that the group listening scheme had considerable educational potentialities, and that—through the Third Programme at least—a more determined effort should be made to encourage the participation of the audience and so increase the citizen's understanding of the world around; but a minority held that the B.B.C. had already put up powerful resistance to the attrition of standards in a democracy. In particular, it urged that the B.B.C. is to some extent supplying the unifying force required to make a democracy a real community, and that the pursuit and practice by the B.B.C. of the democratic values of truth and fairness, as well as of quality, are specially important in this respect.

---

* My Time is My Own: An Irishman at the B.B.C. By John Irwin. Pp. 111. (London: Max Parrish and Co., Ltd., 1955.) 8s. 6d. net.

This function is hindered, if not endangered, by the fourteen-day rule. If it is the function of radio and television in a democracy to ventilate views, the B.B.C. cannot continue to accept a restriction which any newspaper editor would reject forthwith. The Beveridge Committee, for example, observed that "if broadcasting can find a serious audience it is an unrivalled means of bringing vital issues to wider understanding". It can only do so if it is allowed to function freely while the issues are alive; but the attitude of the political party leaders hitherto almost suggests that they are not anxious for a wider and fuller understanding. None the less, the security and welfare of the nation depend increasingly on policy being based on the facts of the situation and not on particular political theories or prejudices. Equally they frequently demand action calling for public co-operation in ways that can only be assured if there is full understanding of what is involved. As Mr. M. L. Jacks wrote in his recent book, "Education of Good Men": "The man in the street needs to be set free from the forces which would mechanise his mind . . . and it is for education to set him free".

Broadcasting, as well as television, could and should be one of the forces which promote such education. The Beveridge Committee rejected the idea of an advisory council on adult education; but had such a council been in existence it would have been well placed to point out authoritatively the real dangers which attend the continuance of the fourteen-day rule, and how it can hinder the fostering of the awareness not only of society, but also still more of the relations which membership of a society involves, and in particular of its far-reaching duties and obligations—duties and obligations of which the rule itself is essentially the negation. Still more effective, however, might well be a determined attempt on the part of the Workers' Educational Association and professional bodies to use to the full the opportunities which broadcasting offers for bringing to the public understanding the essential factors in some problem of national importance whether or not it is currently engaging the attention of Parliament.

The limitations of broadcasting were emphasized by Sir William Haley in the Clayton Memorial Lecture already noted, and because of those inherent limitations, broadcasting needs supplementing if its educational possibilities are to be realized. It is to the development of the appropriate techniques, both in respect of adult education generally and in relation to those needs of a technological society to which Mr. M. L. Jacks and the King George's Jubilee Trust direct attention, that the Workers' Educational Association and professional institutions should be giving much thought and experiment. The techniques must be developed which will enable us to seize the opportunities which the unique power of broadcasting to stimulate public interest presents, provided it is allowed to choose its topics when they are alive and to entrust their handling to men and women chosen, not for their political party loyalties, but for their technical competence in broadcasting, their personal integrity and their vision and sense of public responsibility.

GENETIC PROBLEMS OF THE ATOMIC AGE

With an editorial and three articles, by M. Westergaard, H. J. Muller and R. E. Lapp, respectively, the *Bulletin of the Atomic Scientists* (11, No. 9; November 1955) begins a systematic discussion of the genetic aspects of the atomic age. M. Westergaard, professor of genetics in the University of Copenhagen, writes on "Man's Responsibility to his Genetic Heritage"; this article had already appeared in Unesco's review, *Impact* (6, No. 2; June 1955). It is an exceedingly clear exposition of the principles of genetics, of the effects that changes in environment, on one hand, and in mutation-rates, on the other, may have on the genetic constitution of future generations and of the responsibility that we have towards them from these two aspects. It is probably the best general account for the public of what the genetic problems of the atomic age are, and what kinds of ethical and practical issues they raise.

H. J. Muller writes on "How Radiation Changes the Genetic Constitution". This is the paper which Prof. Muller would have delivered at the Geneva Conference on the Peaceful Uses of Atomic Energy had he not been prevented at the last moment by decision of some cautious administrator. The editorial, "Genetics in Geneva", deals extensively with this remarkable episode and its implications.

If it had been read, Muller's article would certainly not have made headlines as some of the less competent pronouncements at that Conference did. It is a profound appraisal of the present knowledge of the genetic effects of ionizing radiations. Its interest is in two directions. First, it gives new estimates for human populations: (*a*) of the increase in the rate of deleterious mutations expected from increased radioactivity; (*b*) of the present 'load', that is, the level of deleterious mutant alleles already present; and (*c*) of the natural mutation-rates. All three estimates are, of course, in part conjectural, and Muller stresses the urgent need for far more research. But they are the best that can be done with what is available.

Secondly, at each step in these calculations Muller expounds very fully every aspect of the argument. The estimates may not go on being acceptable for long, as more reliable data come in; but Muller's arguments and treatment will remain very useful for a long time. Here probably lies the outstanding value of this article.

The three estimates are: (*a*) for the increase in the mutation-rate following irradiation: at least one mutation per germ cell per about 450 r., considering only lethal mutations and those reducing the fitness of the homozygote by not less than 10 per cent; (*b*) for the present 'load' of such mutations: 6·5–8 per individual; and (*c*) for the rate at which such mutations arise 'spontaneously' in man: about 8 per hundred germ cells.

There are a number of interesting consequences which Muller deduces from these estimates. One is that only about 40 r. applied to a population would be sufficient to double its natural mutation-rate: this is a dose which, spread over some fifteen years, some radiologists may already be receiving. Another deduction is that natural radioactivity may account for about one-sixth of the spontaneous mutation-rate in man. A third deduction is that the loss of fitness in the first generation after Hiroshima cannot be perceptible. Over an existing load of 6·5–8 mutations per individual, an extra one due to parents *both* irradiated with as much as 225 r. would not be detectable under the crude conditions of collection of data. Yet the serious genetic damage is there: some of it is being paid for by the first generation, and the bulk will be spread thinly over innumerable future ones. Muller's article sets out very clearly the apparent contradiction between the amounts of serious genetic damage done and the fact that its consequences are not evident: "even though the induced mutations may be many times the number that would arise naturally in only one generation, they are nevertheless few in relation to the accumulated natural 'load'. Hence they can raise by only a rather small percentage the number of genetic shortcomings already present in the population". It would, of course, be impossible for a population to "tolerate generation after generation an exposure which, given to only one generation, would cause no perceptible deterioration". It is precisely this condition that we have to appraise when considering the genetic consequences of the industrial use of atomic energy, as distinct from those of the military use.

The article by Lapp—"Global Fall-out"—makes very interesting reading for the non-physicist. It deals, however, with fall-out after super-bomb tests, and international agreements to stop these tests should not be far away. As to fall-out in war, the immediate consequences would be final enough for the whole of mankind: it does not seem to be worth while thinking about the genetic consequences.

The editorial, "Genetics at Geneva", deals with the facts and the implications of the 'muzzling' of Prof. H. J. Muller at the Geneva Conference. Prof. Muller is unquestionably the foremost authority in the world on radiation genetics. The rather pitiful series of episodes—already reported in the daily Press, and given again in detail in this editorial—has had, of course, a very beneficial effect: many more will carefully read Muller's paper. It is, however, another example of the threat to the integrity of science recently analysed by Piel (see *Nature*, 176, 1134; 1955). It also shows how dangerous it is to have research on the long-term effects of radiations—a matter of supreme concern for the industrial uses of atomic energy—carried out in the same laboratories and under the same administration as research with an essentially military outlook.

CHALLENGE OF AUTOMATION

The Practice of Management

By Peter F. Drucker. Pp. viii+355. (London: William Heinemann, Ltd., 1955.) 25*s*. net.

Any review of the British edition of this book must begin by echoing many of the praises that have been sung in the intervening few months since the American original first appeared. The praises are deserved—in the sense that the book is dynamic, stimulating and challenging. The echo is right, too, in the invitation to every manager and official in British industry to read the book. But, at least in the mind of the present reviewer, there is a limit to which the fervent adulation should go.

To appreciate the tone and tenor of these tumultuous three hundred and fifty pages, it needs to be recalled that the author, Mr. Peter F. Drucker, is a sociologist by interest, and an industrial investigator by adoption. He has looked at American industry from the top down and has had the fortune—good or bad, according to one's point of view—to look from the top of very big heights. One of his best-sellers was called "Big Business", and the aura of bigness rather than greatness surrounds his latest accomplishment.

Lest this cool comment be taken unfairly as criticism, let it be said that Drucker starts off his volume by disclaiming any intention of writing on the techniques of management; but he did set out to produce a practical book. The reader, as the product turns out, gets a great deal of guidance and help on how not to do things in management, but it is by implication that he is expected to learn what to do and how. The informed reader will come away with a vivid impression of having seen all this before, perhaps not with so invigorating a degree of excitement and incitement. The newcomer to the subject will hug the book to his breast as an indispensable vade-mecum in the toilsome journey through the tasks of executive management.

"The obstacles to the 'automation revolution' are great—above all, the lack of men properly trained in the new concepts and skills." This sentence is perhaps the bedrock of the study: but the skills concerned are not thoroughly technical and intricate, in the vein of electronic brains, elaborate computations and complex mechanisms. They are, instead, the age-old simple skills of motivation and the promotion of morale—not just a re-hash of old personnel management and human relations but the deeper and more vital process of making management a leading force of all efficient operating. "Managing managers is the central concern of every manager" is a recurrent theme throughout Drucker's thought, and it is in this regard that the responsible reader feels most keenly the lack of practical approach: a whole Part of the book is devoted to the theme, but one comes away from it with little more than the inspiration contained in the theme itself.

The fifty pages devoted in Part 3 to "The Structure of Management" are among the most valuable of all. Again, the knowledge is nowhere new; but sound teaching is realistically conveyed, and the notion of 'federal decentralization' is a helpful concept in these days of large and complex organizations. Clearer understanding of Drucker's thesis in this direction would be of immense practical value to the managers and officers of many a British undertaking, including those in the nationalized industries.

Here and there occur items which leave the serious reader much puzzled as to why they are given the degree of emphasis in treatment—unless these are the instances where the author's own lack of practical insight have led him astray. For example, a whole chapter in Part 1 is devoted to considering the objectives of the business, and in the event it says little more than the paragraph of half a century ago wherein F. W. Taylor pleaded that all management decisions should be based on facts and the due analysis of what such facts reveal. Or again, much later in the book the position of the supervisor is surveyed, and recommendations are made about enlarging his responsibilities and the scope of tasks entrusted to him. One is left wondering what sort of a role the representative supervisor has in American industry if the enlargement here called for is so revolutionary: "If the supervisor has a genuine manager's job, if he is adequately supported by his own staff, if he has real authority, and if his unit is big enough—then his job will have become manageable again".

The chapters inquiring "Is Personnel Management Bankrupt ?" will also excite considerable interest among British readers, especially those whose own recognition of the need for specialist personnel assistance has been grudging, if existent at all. But they will be disappointed, for Drucker's answer is in the negative, and his two chapters (22 and 23) on how it can best make its mark are indeed valuable.

It would be a pity to let criticisms of detail hinder the widespread acceptance of an important work, and the foregoing comments have been made in the interests of maintaining a correct perspective. The book is long—in fact, too long for the type of contents that it offers. Yet it is easily readable and has a facile style that makes for ready absorption. Its title, however, can be misleading, and, at a time when reliable information about management action is being avidly sought in Britain, it seems dangerous to let a possibly disappointing source pass by unmarked—disappointing, of course, only in the sense in which the author himself avers that his book does not intend to teach the techniques. To some readers it may, perchance, be disappointing in other directions: for example, the emphatic restriction of 'management' to the business world (that is, the making and marketing of products), whereas in Britain we accept management as equally pertinent in service spheres, in government and in a multitude of non-commercial activities; and did not Mooney and Reiley a quarter of a century ago in the United States claim that the major factor about management was its universality ?

To me the main disappointment lies in the basic acceptance of the superficially popular cliché that "managers are born, not made". Leadership is, indeed, as Drucker says, "important and has no substitute". But to go further, as he does (". . . cannot be created or promoted . . . taught or learned . . ."), is to fly in the face of experience and to run counter to the mature thought of several highly respected thinkers going as far back as Mary Follett in the early 1920's, or Henri Fayol at the turn of the century.

E. F. L. BRECH

HUMAN FACTORS IN UNDERSEA WARFARE

A Survey Report on Human Factors in Undersea Warfare

Prepared by the Panel on Psychology and Physiology. Pp. x+541. Supplement. Pp. ii+92. (Washington, D.C.: National Academy of Sciences—National Research Council, 1949 and 1954.) n.p.

IN 1946 the United States National Research Council appointed a Committee on Undersea Warfare at the request of the Office of Naval Research. This Committee set up a Panel on Psychology and Physiology, and asked the Panel to "draw up an outline for a survey of basic and applied research on problems related to the human factor in undersea warfare". This the Panel did, and then selected a number of authors who were known for their scientific work in the various fields to be covered, and asked them to produce written reports on topics indicated. Few, if any, of these experts had had direct experience of submarine problems, but it was thought that this would be an advantage rather than a handicap since "a fresh and somewhat detached point of view might prove valuable in pointing up new problems".

Most of the reports were prepared during 1947–48, and the volume now under review was first published in 1949. At that time four of the papers—the night lookout; the design and use of optical instruments; visual display of complex information; and arrangement of equipment—were considered to contain material which should be treated as secret. These studies have now been declassified and are issued for public circulation as a supplement to the main volume.

The topics dealt with are: general visual problems; design and arrangement of operating equipment; auditory problems; communication; habitability, physiological and psychological; emotional stability and adjustment; selection and training; and personnel resources. Practically everybody who is actively concerned with human aspects of submarine and related operations should already be familiar with nearly everything that is reported and discussed in this book. Moreover, an immense amount more of experimental work has been carried out during the past six or seven years on all the matters raised and on many others. In numerous ways also, the nature and probable tactics of undersea warfare have changed somewhat radically, with the result that new problems have developed and some of the old ones have changed direction and practical importance.

Nevertheless, this remains an outstandingly valuable source and reference book for the submarine expert, and for many other types of reader it may well come as a revelation of what well-planned physiological and psychological research can accomplish. A great many of the problems considered are of enormous importance in current industrial organization: for example, how to arrange maps and charts and measuring devices on all kinds of optical and other instruments; how to design machine controls and to arrange instrument panels and equipment generally; how to study intelligibility and range of communication, visual and auditory; and how to find out the effects of extremes of temperature, humidity, noise and other forms of stress.

The fact that the whole book has been seriously written by scientists whose principal interests are in fundamental research means that, although the reports now need much supplementing in detail, the data that are reported are almost all thoroughly well accredited, and the methods and procedures described are of wide and permanent interest.

Considering the range of topics covered, and that thirty-four authors have contributed papers, the consistently high level maintained is remarkable. If, however, I had—rather unfairly—to choose one discussion as being of outstanding interest at the present time, I think I should select Dr. J. W. Gebhard's article on visual display of complex information (Supplement, pp. 39–66). His particular concern is with "the problems of an information centre which must handle and interpret diverse ever-changing data collected from many sources". There is no better brief account anywhere of what was known about such problems up to the beginning of 1949, and many of the critical problems which were then pressing have become still more urgent since. All the displays dealt with necessarily present the information to be communicated in coded form. Obviously the human sense organs and brain must also, in their own ways, code observed information for storage and recall. It is of great general interest, therefore, that some of the codings used in radar, sonar and other systems of display should be more fully and immediately accessible to the normal operator than others. Further, the question, which in this article is critically considered and very clearly illustrated, of how many dimensions of change can be simultaneously dealt with in the coded visual display remains still one of great practical importance and fundamental significance.

F. C. BARTLETT

AUTOMATIC FEEDBACK CONTROL

Automatic Feedback Control System Synthesis

By Prof. John G. Truxal. (McGraw-Hill Electrical and Electronic Series.) Pp. xiii+675. (London: McGraw-Hill Publishing Co., Ltd., 1955.) 89*s*. 6*d*.

YOUNG American professors of electrical engineering, especially those who have studied at the Massachusetts Institute of Technology, often write books about automatic control, and the number of re-hashes of 'Brown and Campbell' is now considerable. It is a pleasure to find that Prof. J. G. Truxal's book, although it does not stray far beyond what is recognizable as 'M.I.T. thinking', is an advance on existing books. It presumes acquaintance with one or other of the introductory text-books, and gives an account of the many developments of the theory of feedback systems that have been made in recent years. Accounts are given, for example, of the 'root locus' method of Evans, of the 'pole-zero configuration' approach, associated with Guillemin, the statistical approach that was initiated by N. Weiner, and the 'describing function' and 'phase-plane' techniques for dealing with non-linear systems. There is also a chapter on sampled-data systems.

These and other facets of the subject are clearly presented and intelligently discussed, and although the book is largely a presentation of mathematical procedures that have been described elsewhere, there are many sections in which significant new contributions can be found. A book that brings the knowledge of its readers up to date in this way will be of great value.

The approach is mathematical and based throughout on the use of the Laplace transformation. The book is not intended for beginners, but as a supplement to introductory text-books on feedback systems and on the functions of a complex variable. Regarded as a presentation of the mathematical procedures now available, it is excellent, and will be valuable to advanced students and to designers. References to the literature could with advantage have been more complete. They are given, rather thinly, as footnotes, and confined mainly to American sources.

The value and high quality of this book being granted, it may nevertheless be questioned whether Prof. Truxal has quite justified the use in his title of the word 'synthesis'. It is true that analysis and synthesis are not separable, and that in contriving a control system to meet a specification it may be useful to consider such things as the patterns of poles and zeros of a linear transfer function. But true synthesis would imply a definite numerical procedure, without trial and error, starting from quantities given in the specification and ending with quantities defining the physical construction. It is probably impossible for progress in methods of synthesis to be made, as long as the discussion insists on the excessive generality of being applicable to feedback systems in general. It is possible to go much further if such systems are first classified. For well-defined classes of feedback system—say, for example, large positioning servo systems or automatically controlled distillation columns—one may make progress with the problem of synthesis or 'design for controllability', the parameters of the apparatus controlled being regarded as variables, as well as those of the controller.

The tacit assumption that some 'system to be controlled' is given, and that the only problem is the synthesis of separate control elements to be added thereto, has always been a shortcoming of the Massachusetts contribution in this field, and Prof. Truxal, in so admirably consolidating and even advancing this contribution, has tended to retain the restriction. Perhaps he would consider what the implications would have been if his title had been "The Synthesis of Controlled Systems" instead of "Control System Synthesis". But to suggest that an author might have written a different book is one of the vices of reviewers, and we may be grateful for this comprehensive, clear and well-produced book that will contribute to the further advancement of the development of automatic controls.

A. TUSTIN

Rapport Europées Congrès Toegepaste Electronenmicroscopie, Gent, 7–10 April, 1954

Edited by G. Vandermeersscho. Pp. 359. (Gent: Rijksuniversiteit, 1954.) 500 Belg. francs.

THE Centre for Electron Microscopy of the University of Ghent organized in April 1954 the first congress devoted solely to the applications, as opposed to the fundamentals, of the subject. Previous meetings of an international nature had covered all aspects, but the rapid advance in the uses of the electron microscope justified a conference with a somewhat narrower scope. The proceedings of the congress, published with commendable speed within six months of its termination, shows that the range of topic was still very wide, while the list of authors substantiates the title "European".

Eleven papers are concerned with the electron microscope itself and special methods of operation, such as the reflexion and emission techniques and electron diffraction. Another eleven papers cover medical and biological applications: ultra-microtomy, bacteria, viruses and fibrillar structures. Only five contributions deal with metallurgical problems, confirming the general observation that this field has been the slowest to find uses for a higher resolution than the optical microscope provides. On the other hand, a new trend of the past few years is strengthened by the amount of attention paid to chemical and industrial applications. Ten papers in this group cover a wide range of materials: ceramics, greases, textile fibres, metal oxides, clays and fluorescent powders.

The volume thus presents a useful picture of the present state of applied electron microscopy. It remains only to say that speed of publication has not led to any sacrifice in quality of production; the printing, binding, and reproduction of micrographs are alike excellent. The editor, who was also in charge of the organization of the congress, must be congratulated on the fruits of his efforts.

V. E. COSSLETT

An Illustrated History of Science

By Dr. F. Sherwood Taylor. Pp. xii+178. (London: William Heinemann, Ltd., 1955.) 25*s*. net.

AS a history of science this book increases our indebtedness to the late Dr. F. Sherwood Taylor, who did so much to present the results of intensive research in language that the ordinary reader can appreciate.

As an illustrated history of science it is unique. Based upon the 1953 Christmas Lectures at the Royal Institution, London, in which the author dealt with some of the historic experiments in natural science, it has, among others, illustrations relating to the apparatus and conduct of the experiments. These, from sketches drawn by A. R. Thompson, are built up around what could be discovered about the way of life in the times when the experiments were first made, and are not merely substitutes for photographs which might have been taken had photography been possible. They have a liveliness that makes the reader feel that he is an eye-witness of what was going on, when, for example, the Abbé Nollet felt the shock from a Leyden jar, or Sir Humphry Davy demonstrated the electric arc in 1808.

Beginning with the observations of the Egyptian priest-astronomers and the Greeks who studied science for its interest rather than its use, the author surveys the early days of experimental science and its remarkable progress during the eighteenth century, the work of men like Faraday, Kelvin, Edison and Crookes in the nineteenth, and the past fifty years during which "so much knowledge and power have come into men's heads and hands that they cease to think of science as some specialised occupation, but are coming to regard it as a way of understanding and organising any job of work".

F. J. NORTH

General Microbiology

By Prof. William G. Walter and Prof. Richard H. McBee. (Based on the original text by Prof. D. B. Swingle.) Pp. ix+345. (New York: D. Van Nostrand Company, Inc.; London: Macmillan and Co., Ltd., 1955.) 35*s*. net.

IN 1940 a book was published by the late Prof. D. B. Swingle, of Montana State College. It was entitled "General Bacteriology" and, as an introduction to the lower forms of life, was so well received that it was revised and issued in a second edition in 1947. Two of Swingle's successors at Montana, Profs. W. G. Walter and Prof. H. McBee, have now made a thorough revision of the earlier work and, as the title implies, have adopted a broader approach.

Some of the more recent aspects of bacterial cytology, genetics and nutrition are described to illustrate the growing importance of the study of bacteria as a means of illuminating some of the newer disciplines. A new section describes the mutual relations of micro-organisms, while chapters on pathogenic bacteria and viruses have been expanded. The book is extremely well illustrated and would form an admirable introduction to the study of microbiology for professional and lay readers. Its weakness is in the chapters dealing with applied bacteriology. The few pages on industrial microbiology, for example, are so scanty that they could profitably have been omitted to allow a wider treatment of a topic like the microbiology of milk products.

T. H. HAWKINS

Hydro-Electricity and Nature Protection

Stating the Case. Prepared by the Rt. Hon. Lord Hurcomb. (Pro Natura, Vol. 2.) Pp. 224. (Bruxelles: Union Internationale pour la Protection de la Nature, 1955.) n.p.

IN the summer of 1952 the International Union for the Protection of Nature held its third General Statutory Assembly at Caracas. A technical meeting was held at the same time which brought together two hundred experts representing thirty-two countries and five continents. One of the items discussed was "Hydro-electricity and the Protection of Nature". A volume of 550 pages containing the proceedings and the papers of the Caracas meeting appeared in 1954; but it comprised several subjects and it had also to be reproduced in three languages and principally in Spanish. As a result, the remarkable documentation on hydro-electricity that had been gathered from sixty preliminary reports, submitted to the Caracas Conference by specialists from all over the world, could not be used to the full extent of its worth.

A volume has now been prepared by the Right Hon. Lord Hurcomb, vice-president of the Union, with the aim of placing within the reach of the public as much as possible of the more important points of this documentation in an abbreviated form. Some of the papers are in French and some in English; a French summary is given of the papers published in English, and vice versa.

NEW UNDERWATER HYDRODYNAMIC RESEARCH LABORATORIES

By F. S. BURT
Admiralty Research Laboratory

THE Admiralty recently released information on the new Underwater Hydrodynamic Research Laboratories completed just over a year ago. These new facilities, which form part of the Admiralty Research Laboratory, Teddington, are to carry out fundamental research into the behaviour and characteristics of underwater bodies with the view of investigating the possibilities of making major advances in this comparatively unexplored field of hydrodynamics. The total cost of these facilities was just over one million pounds. The present article is published by permission of the Admiralty.

The most spectacular item of the equipment is the 60-ton rotating beam and annular channel which have been designed to investigate the behaviour of bodies moving at high speed under water. In addition, there are two water tunnels which are analogous to the wind tunnels used in aeronautical research. There is also a glass-sided water entry tank for investigating, on a model scale, the problem of the entry of missiles from the air into the water.

Rotating Beam Channel

The rotating beam channel, which is housed under a 160-ft. diameter dome, is used for the measurement of stability and control characteristics and also for the investigation of bodies of various forms moving at high speeds under water. The 122-ft. span rotating beam spins over the annular channel of rectangular section, 34 ft. wide and 15 ft. deep. The radius of the inner wall of the channel is 34 ft. and that of the outer wall 68 ft. The models, which may be up to 20 ft. in length, are normally run at a depth of 5 ft. and may be attached to the beam at alternative radii. The maximum speed of the beam is approximately 30 revolutions per minute, giving a speed of 150 ft./sec. at the 50-ft. radius or nearly 100 knots at the 55-ft. radius. The beam is driven by a 1,510-h.p. 600-V. D.C. motor controlled by a Ward Leonard set, and its speed can be controlled either manually or automatically to any speed to within 0·1 per cent of the top speed. For some of the tests it is necessary to obtain speed very rapidly and this is achieved by

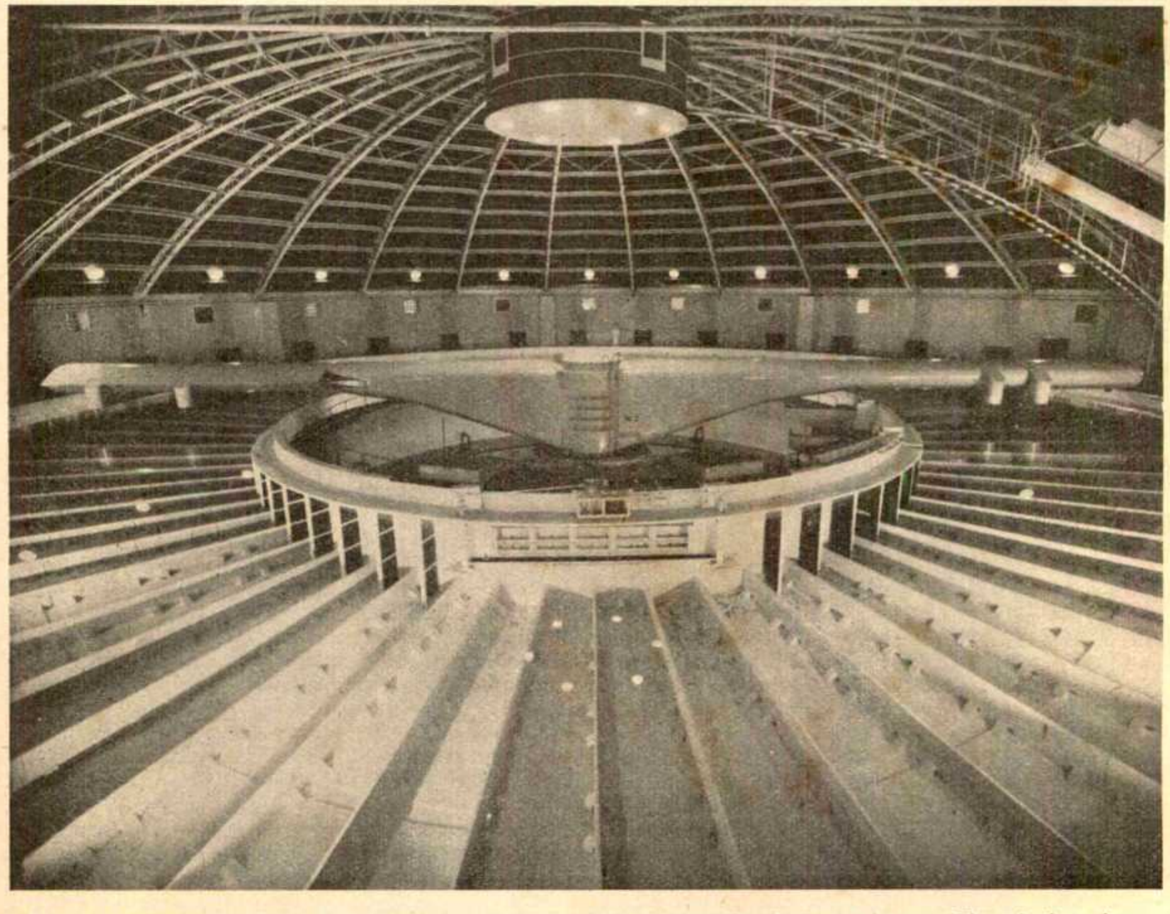

Fig. 1. The annular channel and rotating beam. The windows of the inner observation chamber can be seen. The water is so clear that it is difficult to see it even in the original photograph

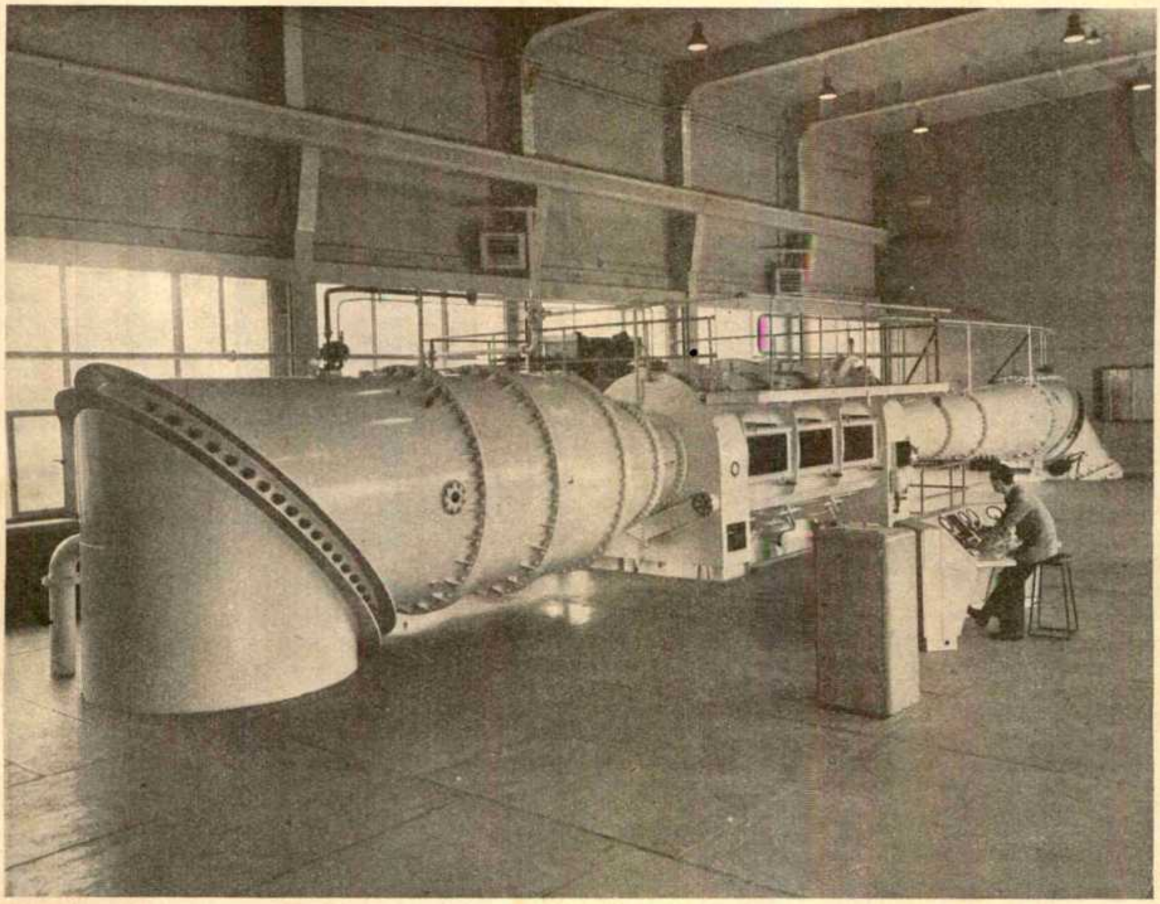

Fig. 2. The 30-in. water tunnel, showing the working section and the control console

over-running the electrical plant for short periods, enabling the beam to be got up to maximum speed in only fifteen revolutions.

At one section of the channel large windows are provided in both the inner and outer walls. The windows are made up of large 1¼-in. thick 'Triplex' panels through which the models can be observed. To enable high-speed photographs of the experiments to be taken, the million gallons of water in the channel is specially treated and filtered. By careful control the optical transmission of light in the channel is as high as 90 per cent per metre compared with air.

The models which are run in the channel and also those used in the larger water tunnel may be powered, and always contain within themselves the necessary instrumentation to measure any forces, moments or pressures that may be required. The resistance strain gauge, used in an A.C. bridge, is the standard transducer for all measurements.

The Water Tunnels

The first of the new major pieces of hydrodynamic equipment to be built was the water tunnel having a working section diameter of 12 in. This tunnel was designed to be as versatile as possible and has a variety of alternative working sections. The water speed can be continuously varied up to some 82 ft./sec. in the closed jet and up to about 62 ft./sec. in the slotted-wall working section.

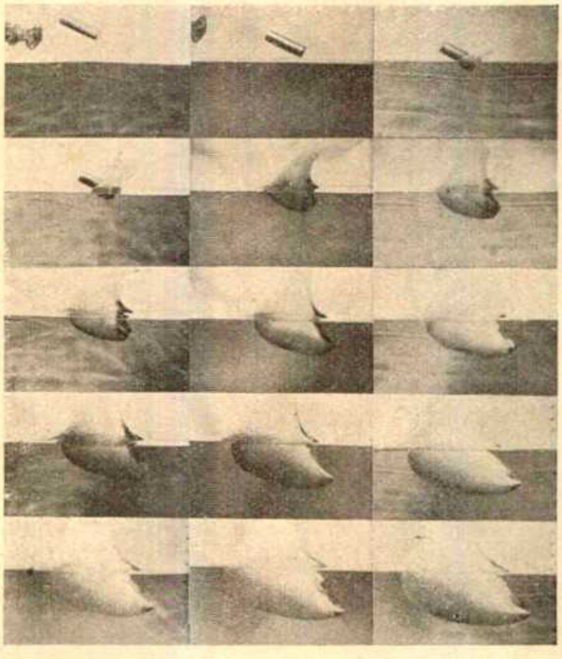

Fig. 3. Multiflash photographs (2 μsec., 110 joules) of a typical water-entry trajectory

The larger of the two water tunnels has a jet diameter of 30 in. and the speed is continuously variable up to 60 ft./sec. (35 knots). In both tunnels the pressure at the model can be varied between 2 lb. per sq. in. and 45 lb. per sq. in. absolute. Powered models cannot be made much less than about 8 in. in diameter, and much thought was therefore given to the design of a suitable working section. This resulted in the concept of a slotted-wall working section partially open and partially closed. The philosophy behind this idea is that the wall corrections of an open jet are very much less and of opposite sign to those of a closed jet, and by enclosing the open jet by a cage of bars one can in fact get the virtues of an open jet tunnel and a very much longer working section.

A considerable amount of development was done on the optimum layout of such a working section, and as a result of this it has been found possible to double the effective size of the working section, at any rate so far as tests on bodies of revolution are concerned. Hence powered models some 10 in. in diameter and up to 12 ft. long containing 100 h.p. can be tested in the 30-in. tunnel. These models are fitted internally with a five-component balance and also means of measuring the torque and thrust.

In addition to the novel working section, this tunnel is also fitted with a 'resorber'. This takes the form of four 11-ft. diameter passes up and down a 60-ft. deep pit, and by the combination of pressure and time re-absorbs any cavitation or gas bubbles that may have been formed in the working section during the course of the experiments.

Model Water Entry Tank

To assist in the study of the air-to-water entry behaviour of weapons, a new glass-sided tank 29 ft. long, 9 ft. deep and 5 ft. wide has recently been erected. This tank has been designed to examine the behaviour on entering water of 2-in. diameter models which are fired from a slotted cylinder catapult with entry speeds of up to 300 ft./sec., which on Froude scaling corresponds to about 1,000 ft./sec. full scale.

The virtue of this type of catapult is that it enables the models to enter into the tank with varying amount of pitch and yaw, which are vital parameters in these investigations. The models can be fired into the tank at any angle between horizontal and vertical, and high-speed photography is used to examine their behaviour.

USE OF SOLAR ENERGY

THE World Symposium on Applied Solar Energy and the Conference on Solar Energy, which were held recently in Arizona, have received considerable publicity. These conferences were sponsored by the Association for Applied Solar Energy, the Stanford Research Institute and the University of Arizona, with Mr. Lewis W. Douglas as the general chairman. That more than a thousand scientific workers, representing many nations, travelled to Arizona to discuss problems concerned in the application of solar energy, indicates the interest in a subject that was first exploited forty to seventy years ago and which has been intensively studied during the past ten years. Press reports from the conferences on the future of solar energy have varied from unqualified optimism to salutary pessimism. At the concluding session, the vice-chairman, Mr. Merritt L. Kastens, who was responsible for the organization on behalf of the Stanford Research Institute, said that he had been asked: "Were the conferences successful?" He said that he would be able to answer this question in ten years time; this was the only reply that could be given, for it is difficult at the moment to see in correct perspective the precise applications of solar energy that are economic, and the path of future developments.

Whatever may be the outcome of the conferences, there can be no question that never before have all the existing facts concerning the present position of research in the various applications of solar energy been presented simultaneously and freely discussed by scientists, engineers and industrialists, and the conferences mark a turning-point in progress. It was indeed this consensus of opinions from workers in many fields that gave unique importance to the meetings, for the problem of utilizing solar energy must be considered on a global scale and cannot be limited to the specific requirements of any one country.

The two meetings, held consecutively, were independent but complementary. The conference, which was held first in the University of Arizona, was for the purpose of discussing among scientific workers the basic problems that must be solved before solar energy can be successfully applied, with a detailed description of researches at present in progress for this purpose. The symposium, held in Phoenix, was intended to summarize the general position of solar-energy utilization and especially to acquaint industrialists with the problems involved, since successful development depends ultimately upon co-operation between science and industry.

Conference on Solar Energy

A total of nearly a hundred papers was presented at the Conference on Solar Energy, and this necessarily involved sub-division into a number of separate sessions. The opening session, of a general nature, dealt with the characteristics of solar radiation as emitted from the surface of the Sun and as received at the surface of the Earth, these studies being an essential preliminary to the study of utilization. Prof. Farrington Daniels also gave a general paper outlining the methods of utilization.

The remaining sessions, held concurrently, were as follows. Section *A*: Thermal processes comprising flat-plate collector design and the principles of selective radiation; solar furnaces for the production of high temperatures; solar energy for house and water heating, for cooking and water distillation; solar power machines. Section *B*: Photochemical processes comprising large-scale algal culture; algal physiology; photochemistry in higher plants and in non-biological systems. Section *C*: Electrical processes for the direct conversion of radiation to electricity, including thermoelectric generators, photovoltaic cells and $p-n$ junctions and photogalvanic cells. There was also a session devoted to a discussion of the measurement of solar radiation. The technical implications of these papers are discussed later.

World Symposium on Applied Solar Energy

The general scope of the technical papers at the World Symposium was similar to that of the papers presented at the preceding conference, but they were intended for an audience possessing a wider range of interests. Each author was a recognized authority on his subject, and presented this in the form of a comprehensive survey.

The opening remarks were given by Mr. Lewis W. Douglas, and were followed by an invocation delivered by the Right Rev. Arthur B. Kinsolving, Bishop of Arizona. Prof. Farrington Daniels, of the University of Wisconsin, who is doing so much to promote research on solar energy, and Dr. J. E. Hobson, director of the Stanford Research Institute, presented papers covering in a comprehensive manner the utilization and economics of the applications of solar energy. The principal speaker at the welcoming luncheon was Sir Edward Bullard, director of the National Physical Laboratory, who outlined the benefits that could accrue from solar energy, but also emphasized the difficulties involved in such developments. It was generally considered that his realistic speech counteracted the excessive optimism of those who were unaware of the true magnitude of the problem. At the banquet, Mr. John Jay Hopkins, chairman and president of General Dynamics Corporation, gave an inspiring address on the possibility of creating a World Energy Community by united governments to organize correlation of all energy resources. He emphasized the need to adapt our thinking to changing times and conditions in considering the relationship between the forces of atomic fission, fusion and applied solar energy.

An exhibition of solar appliances was arranged at Phoenix in conjunction with the symposium. Comparison was facilitated of the various schemes for house and water heating, for water distillation and for solar cookers. In this latter connexion efforts are being made by the research group at the University of Wisconsin to reduce costs by constructing the reflectors from aluminium-coated plastic instead of sheet aluminium. The largest single exhibit was an engine of Italian design, operated by sulphur dioxide vapour and used to drive a water pump. The National Physical Laboratory of India showed a small-scale model to illustrate its system of movable panels of mirrors which can be used to provide concentrated radiation for steam generation or other heating processes. Examples of solar furnaces were demonstrated and also some ingenious pumping devices operated directly by the action of vapour and liquid.

The particular value of the exhibition was that it enabled industrialists to see the present state of progress, and to compare directly designs from different countries. Though extremely instructive, many of the inventions shown clearly require much more development before becoming anything like economic possibilities.

Summary of the Technical Papers

It is impossible to describe in full detail the contents of such a large number of papers, but a brief indication is given below of the scope and present state of development in those fields where solar energy could be applied.

House heating. Much can be done by the suitable design of houses to reduce the artificial heat load required, by double-glazed windows and effective heat installation. Additional heat can be provided by collectors of the flat-plate type fixed on the roof with a sufficient hot-water storage to last over two or three days. Several solar-heated houses have been operated in the United States for a number of years, and a newly designed house will shortly be constructed at the Massachusetts Institute of Technology, which should be capable of supplying 80 per cent of the heating requirements throughout the year at Cambridge, Massachusetts.

Water heating. The heating of domestic hot water by solar radiation is a relatively simple process in suitable locations; the problem is to reduce the cost by mass production. Many designs of heater were described, and a large number of simple appliances are in operation in Japan, which has an acute fuel shortage, though the solar radiation conditions are far from ideal. The cheap supply of natural gas in the United States seems to have curtailed the development of solar heaters, even in areas having high solar radiation.

The efficiency of the flat-plate type of collector may be improved by coating the absorbing surface with a thin metallic oxide film which is a good absorber of visible radiation, but a poor emitter of the longer heat waves re-radiated from the collector surface. The researches in this field, described by Dr. H. Tabor, director of the National Physical Laboratory of Israel, created considerable interest at the conference and may have far-reaching consequences by raising the operating temperature of the flat-plate heat collector and extending its use to steam generation.

Water distillation. A simple design of water still for the conversion of brackish to potable water would be a great benefit to isolated farms in arid areas. Considerable development has taken place in the design of such stills in Algiers, Morocco, Australia and California. Here again the essential problem is to produce a design which will be cheap and yet robust. Experiments are being made with the substitution of plastic for glass condensing surfaces. The average rate of distillation is about 0·8 lb. of water per day per square foot of surface area.

Mechanical power. Small power units for irrigation pumping could replace the very inefficient devices, using human or animal power, which are still employed in some parts of the world. Present developments include the Italian design of engine using sulphur dioxide vapour as a working fluid which costs about a thousand dollars per horse-power output. Other possibilities are steam or hot-air cycles, and development of these is proceeding in India, the U.S.S.R. and Israel. Several ingenious designs were described in which the direct action of volatile fluid is used to operate water pumps, but the efficiency of all such devices is necessarily low because of the small temperature difference utilized.

Electrical power. Solar radiation may be converted to electricity by thermo-couples in which heat is an intermediate form of energy and which, therefore, are subject to the toll of the Carnot efficiency. Higher efficiencies are attained by photoelectric devices, and the Bell silicon cell which is now in commercial production attains a conversion efficiency of 11 per cent. The high cost of the cell (25 dollars a square inch) means, however, that at present such applications are very limited; but a battery of such cells is being used to charge accumulators on telephone systems, and to operate portable radio transmitters and receivers.

Photogalvanic effects. Certain chemical processes are affected by the action of light with a change in the equilibrium. This change may be used to create an electric potential which may be discharged when the products revert to their original state. At the moment such processes are inefficient, but there is the possibility of remarkable developments which may extend the scope of the applications of solar energy. It is possible in a similar manner to produce hydrogen which could be stored and used at any convenient time as a fuel.

Solar furnaces. A number of solar furnaces for the production of very high temperatures have been constructed; the largest at present in use is the well-known 40-ft. diameter mirror at Mt. Louis in the Pyrennees. This was designed by M. Felix Trombe, who announced that construction has now been commenced of a new furnace which will have a capacity of 1,000 kW. There are also large solar furnaces in operation in Algiers, the U.S.S.R. and the United States. At the moment these furnaces are used for research on the properties of materials up to temperatures of 3,000° C.; but they could also be developed for production purposes in suitable localities.

Algae cultivation. Intensive production of algae can be stimulated by the application of solar energy, though the general opinion was expressed that this would only be economically feasible for food production. A suspension of the algae in water, with the addition of nutrients and enrichment of carbon dioxide, is circulated in a suitably designed pond or tank. Although the efficiency of conversion based on the light quanta absorbed for the liberation of one oxygen molecule may approach 30 per cent, the overall efficiency does not exceed 5 per cent in these special cultivation tanks, compared with a figure of well below 1 per cent for the normal growth of crops on land. *Chlorella* is normally used, and there are many biological problems, such as the development of strains which will grow rapidly at temperatures up to 40° C. and will resist diseases or contamination. Considerable development work is in progress in the United States, Japan, the Netherlands and Germany.

Air conditioning, refrigeration and heat pumps. This is a field which is particularly apt for the utilization of solar energy and yet is one where little research work has been described. The problem is to adapt present well-known cycles, such as the absorption process, to operate at the low temperatures attainable by flat-plate collectors. Concentration by mirrors would enable existing cycles to be utilized, but it is generally considered that the expense of such systems would not enable them to compete with fuels as an energy source. Solar heat collectors could be used in temperate climates to improve the performance of heat pumps, if a suitable means of storing the low-temperature heat were available.

Conclusions

Solar radiation is almost the only source of energy that remains unexploited. The total amount of energy available is ample for the world's requirements, and the difficulty lies principally in its relatively low intensity and variability due to the changing position of the Sun and atmospheric effects. The normal energy sources, apart from nuclear energy, are naturally concentrated forms of solar energy—either as fuels which are a concentration in time, or water power which is a concentration in space. So long as these are available, there is little scope for the application of solar energy, mainly because of the high initial cost and the difficulties of energy storage. But there are many places where fuels are expensive or in some cases non-existent, and in such areas there are potential fields of application for solar energy. For example, electrical power could probably be developed from solar energy at a cost of about a shilling a kWh., which would be unacceptable for large communities but would be welcomed if no other source were available.

Artificial collectors of solar energy, namely, all processes except the natural photosynthesis by living plants, comprise essentially the flat-plate type of collector, or concentrating systems with mirrors, or devices which collect photon energy directly. The first method degrades the radiant energy to heat at a low temperature-level; the second system operates at a high temperature-level which can attain half the temperature of the Sun's surface, but is necessarily more complex and needs a guiding system. These systems are satisfactory if the energy is to be used in the form of heat, but in the production of power the inevitable toll of the Carnot cycle results in a low efficiency of operation. If the objective is electrical power, then devices that convert the photons directly into electricity by photovoltaic methods have higher efficiencies and are therefore more promising if the present cost can be reduced by a factor of ten or a hundred. It is along such lines that major developments in the future must inevitably proceed, though, in the meantime, the conventional heat-cycles of low efficiency may bridge the gap.

Applications of solar energy should not be considered as substitutes for existing energy sources but rather as complementary, and the various energy sources should be combined according to the requirements and the resources of the location. Solar energy cannot replace many of the existing uses of concentrated energy, either thermal or nuclear, but can supplement these, especially for the production of heat at relatively low temperature-levels, that is, below the normal boiling point of water. At the moment, solar energy is essentially for nations that 'have not' rather than for those that 'have'; it may enable many of the benefits of industrial civilizations to be attained by those living in isolated and undeveloped areas, by increasing the comfort of life and improving the amenities. In time to come, as fuel reserves are depleted, applications will be extended, and in the future solar energy may contribute greatly to the supply of energy. Considered from these aspects—that is, as an immediate policy for undeveloped areas and as a future policy for other areas—the continuation of research on the utilization of solar energy fulfils an important function in global development.

The Arizona conferences cannot do other than stimulate all these developments; but in addition two definite proposals have emerged from them. The first is the creation of a journal for the publication of solar energy research, and the second is the formation of an applied solar energy research laboratory, possibly in Arizona. Finally, the delegates from outside the United States, numbering more than a hundred, who attended through the generosity of American foundations, will have returned to their own countries with inspiration renewed from these memorable conferences. HAROLD HEYWOOD

LARGE-SCALE WEATHER PROCESSES

A SHORT course of three afternoon lectures on "Large-Scale Weather Processes" was given on November 3, 10 and 17 at the Royal Institution, London, by Dr. R. C. Sutcliffe, deputy director (research) of the Meteorological Office. The broad thesis, concerning those parts of the atmosphere, the troposphere and lower stratosphere, which are of primary interest in weather and climate, was first to consider the mean world distributions of temperature and wind as revealed by direct observations, mainly by the methods of radiosonde and radar wind, during very recent years; then to discuss the large-scale day-to-day variations upon this mean state; and finally to review the problem of the general circulation of the atmosphere in the light of these results.

Many serious gaps still remain in the world network of upper-air stations. For climatological purposes the northern hemisphere is tolerably well covered, special credit being due to the combined Canadian–United States efforts in the far Canadian North and to the international Ocean Weather Ship scheme of the Atlantic. The wide stretch of the Pacific is relatively poorly charted, but the tropical land areas have many valuable stations, India being notably progressive, as would be expected from its long tradition in meteorological work. The chains in the southern hemisphere, mainly the efforts of South Africa, Australia and New Zealand, still leave large uncharted areas, and the Antarctic is little known. Much hope is placed upon the coming International Geophysical Year to provide answers to outstanding questions on three-dimensional world climate.

The early ideas on the broad troposphere–stratosphere structure have stood up well to recent observations. The mean level of the tropopause near the equator is at about 100 mb. pressure, about 16 km. high, where the temperature averages about −80° C. with an inversion above continuing to the ozonosphere. In middle latitudes the values are about 250 mb., 10 km. and − 60° C., and approach 280 mb., 9 km. and −50° C. towards the northern pole during summer. During winter the north polar tropopause is often ill defined, and temperatures at these levels fall to lower values. The earlier model, with a continuous sloping tropopause, has, however, been generally abandoned during recent years, the data pointing to a rather sudden break and lowering from 100 to 200 mb. near lat. 30°. There is also frequently, although not everywhere and invariably, another discontinuous descent with increasing latitude in the neighbourhood of the polar front, although this is a region of large day-to-day variations, and in the northern winter the polar front discontinuity in the tropopause tends often to merge with that at low latitudes. The picture for the southern hemisphere is similar so far as data go, but the mean state in high latitudes is largely conjectural; temperatures at equal heights are certainly lower and may average − 60° C. in summer and − 70° C. in winter at the polar tropopause.

The upper-air pressure field can be derived from the surface pressure and the hydrostatic equation, while the equation for the geostrophic wind suffices to give the general pattern of winds except quite near the equator. The limited amount of upper wind data fits well enough into the geostrophic pattern. The most striking features are the jet streams—the more-or-less strong wind maxima reached below the tropopause—and it is now believed that there are two distinct westerly jet streams in each hemisphere associated with the two zones of rapid change or discontinuity in tropopause height. Again, the absence of adequate data makes the picture uncertain, and it is necessary, especially in middle latitudes, to draw the distinction between the climatological mean and the daily synoptic patterns. In the mean the two maxima seem to merge in some longitudes and seasons, whereas the separation can usually be traced on daily charts. The climatological mean maximum wind strength attains a value of 150 knots in certain longitudes in winter, and there seems no doubt that the jet stream structures can, with varying intensity, be traced through all longitudes.

In the study of variability Dr. Sutcliffe confined his attention to middle latitudes. The salient place in theory taken by horizontal wind divergence (in the normal hydrodynamical sense) was stressed by showing its relation with pressure change through the hydrostatic equation; with vertical motion and adiabatic changes through the equation of continuity; and with the development of circulations, cyclonic and anticyclonic, through the vorticity equation applied to quasi-horizontal motions on a rotating Earth. This key part played by divergence would indicate an approach to theory through its direct study; but it is one of the peculiarities of dynamical meteorology that this most interesting quantity is not determinable either from measured winds or geostrophic estimates. A significant divergence for hydrostatic pressure change is less than 1 per cent per day and for vertical motions less than 10 per cent per day. Since winds can be measured, even granted the network, with an accuracy little better than within 10 knots, the divergence over areas of dimensions 100 miles may be directly estimated only within some 10 per cent per hour. The use of the geostrophic wind has long been known to be useless in this respect, as the divergence of momentum vanishes identically, apart from a term due to variation of latitude which is a minor term in dynamical development.

The direct approach through divergence has therefore to be abandoned, at least in extra-tropical latitudes, but the problem has yielded much to an attack resting on the vorticity equation. Vorticity and its changes can be estimated approximately from the geostrophic equation (more recent work aims at using a less-restricted stream function), and the dynamics can be built up from this approach. The simplest, yet still fruitful, attack has come by studying the dynamics of a barotropic atmosphere, virtually non-divergent flow. The justification for meteorological application rests on the smallness of the vertical integral of divergence compared with rates of change of vorticity by advection. In a broad sense the whole troposphere may thus be regarded as moving with a mean field of motion which is almost non-divergent. From this first approximation Rossby derived his now classical barotropic wave equation for idealized zonal flow, which is almost certainly related with the observed long waves of continental dimensions in the circumpolar westerlies.

The two-dimensional solution of the barotropic equation carried out numerically with electronic computing aids and starting with the known initial conditions provides a forecast of the mean flow for twenty-four hours ahead which stands comparison with both the facts and the best efforts of trained forecasters using established methods. Dr. Sutcliffe went on to describe more elaborate dynamical models which take account of divergence and vertical motion and which can therefore handle not only the mean motion but also vertical variations with cyclones and anticyclones. It may now be said that a deductive theory of the behaviour of large-scale systems in extra-tropical latitudes can be presented as a straightforward, if still only approximate, development from the hydrodynamical equations. This branch of meteorology has therefore, within the past decade, rather suddenly become almost a matter for formal text-book treatment in the tradition of applied mathematics, and the application of the theory is at present going rapidly ahead towards a new system of forecasting using electronic aids, with the research division of the Meteorological Office at Dunstable making a major contribution. Results so far are definitely encouraging, although in the nature of the physical problem no revolutionary increase in forecasting accuracy can confidently be predicted.

The theory applied to the complex large-amplitude oscillations in the wind flow, coupled with other studies based on perturbation theory, lead to the conception of large-scale instabilities and exponential growth-rates of disturbances as the normal state of the atmosphere, and numerous slides shown by Dr. Sutcliffe, illustrating the surface and upper-air weather-maps, made this interpretation seem eminently realistic. The atmosphere is essentially in turbulent motion on the scale of many hundreds of miles, and the evolution of individual turbulent elements is likely to present tremendous, perhaps insuperable, difficulties when the prediction period is extended beyond the time-scale of growth or decay, of the order of one day.

In the final lecture the problem of the general circulation was formulated as that of deriving the mean state and motion of the atmosphere from the basic assumptions of an atmosphere of known composition on the rotating Earth, with land and sea surfaces, subject to solar radiation. At the present time there is no fundamental deductive theory available. Attention was directed to the summer and winter averages of mean-sea-level pressure and the radical differences between them, especially in the northern hemisphere, differences evidently linked with the land and sea distribution and broadly monsoonal in character. This complication is something superposed on a symmetrical planetary circulation, and the first step in a basic theory is naturally to derive the circulation as it would appear on a symmetrical ocean-covered Earth. Evidence, especially from the southern hemisphere, indicates fairly conclusively that the solution must provide for a mean low-pressure belt around the equator, subtropical high-pressure belts bounding the easterly trade winds of lower latitudes, broad belts of prevailing unsettled westerlies bounded at high middle latitudes by low mean pressure with relatively high pressure again at the poles, presumably also much disturbed by synoptic systems. Some sort of zonal mean organization is inevitable on a symmetrical Earth, but Dr. Sutcliffe was not prepared to prove that either a smaller or larger number of zones is fundamentally impossible. One must bear in mind that in certain tropical oceans intense cyclones are rather common in low latitudes, and that under rather different conditions the Earth might well have these features regularly, giving two belts of low mean pressure with prevailing westerlies and relatively high pressure at the equator. There is also a frequent, but passing, tendency for a double cyclonic zonal structure to appear in middle and high latitudes. A basic theory should show that the assumed zonal organization is necessary, but perhaps also that an essentially different organization would be found if the values of the fundamental quantities, in particular radiation, were different perhaps only by a little from their present values. Facile qualitative arguments which purport to explain the general circulation are of little value; quantitative treatment is essential.

Pending the development of such basic theory, meteorologists are devoting their attention to the mechanism of the circulation as it is observed and attempting, with some success, to show by what processes the long-term average state is maintained as a balance between losses and gains. Brief attention was given by Dr. Sutcliffe to the water, energy and zonal momentum accounts. Evaporation and precipitation must balance over a relatively short period of time, for the mean world value is about 90 cm. a year, whereas the air contains no more than the equivalent of about 2·5 cm. of water. The patterns are, however, very dissimilar, with precipitation maxima in low and middle latitudes separated by a precipitation minimum which, over the oceans, is an evaporation maximum. The evidence is that the relatively steady trade winds are the vehicle carrying moisture to the equatorial rains, but that the transport to the middle latitude rain areas comes mainly in bursts of moist tropical air (the warm sectors of depressions), separated by bursts of cold dry air moving towards the equator; the transport is then a turbulence phenomenon and not a steady flow in a mean meridional current.

Time prevented a detailed consideration of energy balance during the lecture, but attention was directed to the large amount of energy transported as latent heat and to the less well-known contribution from gravitational potential energy. An inflow of air at high levels coupled with an outflow at low levels could have a major effect in increasing the total energy over an area; the high values of thermal or internal energy over warm anticyclones are really derived from such overturning. The evidence is that a large part of the poleward flux of energy in tropical latitudes which redresses the lack of balance in radiation is carried as gravitational potential energy.

Considerations of zonal angular momentum have received much attention. The long-period balance requires a zero total couple around the polar axis as the result of friction between ground and atmosphere, and this requires a degree of balance between westerly and easterly winds. But taking zones separately, the trade-wind belt with a westward frictional couple exerted on the atmosphere must export westward angular momentum to be returned to the Earth through the friction of the prevailing westerlies. The different zones are thus very closely linked, and one wonders how far forecasting in middle latitudes, which at present takes no explicit account of the trade-wind belt, can be expected to go.

At the present time it is believed that a steady overturning in low latitudes—a meridional convective circulation with ascent near the equator and subsidence towards and in the sub-tropical anticyclones—is an essential link, but that farther northwards the momentum transport (as the moisture transport) is mainly the effect of the unsteady motions, with mean meridional motions playing a minor and perhaps negligible part.

The study of mechanisms, and especially of the relative importance of steady mean circulations and irregular motions, is important if the basic problem is to be formulated in a manner suitable for mathematical attack. It is now thoroughly established that the mean state of the atmosphere cannot be maintained by the mean motions and that the two together do not provide the solution to any real problem. Thus the nature of the turbulence, which is physically different in different zones, must be introduced into the theory at a very early stage: it is not a mere embroidery on a general circulation existing in its own right. It seems probable that the wave-length or scale of unstable synoptic systems which theory shows must develop in the baroclinic atmosphere sets a scale to the zonal mean organization.

The time now seems to be ripe for an attack on the basic problem, and experience with electronic computing for dynamical forecasting in middle latitudes has given to the mere complications of calculating a less formidable appearance. Much progress is almost certain to come during the next decade, and it is urgently required. When one compares the two summers of 1954 and 1955, as experienced in Europe, one is forcibly struck with the fact that the general circulation averaged over a matter of months may run quite differently from one year to the next and so far with no explanation whatever. It seems unlikely that such differences will be understood unless we have a basic theory of the planetary circulation on which to build, and the physical nature of the problem of seasonal weather prediction must for the present remain a mystery.

POPULATION OF BRITISH UNIVERSITIES IN THE 1960's

THE AGE-GROUP BULGE

AT the final session, on the afternoon of December 17, of the 1955 Conference of the Universities of Great Britain and Northern Ireland, the problem of "The Age-group Bulge and its Possible Effect on University Policy" was discussed, with Dr. D. W. Logan (principal, University of London) in the chair. In the opening address, Dr. G. E. F. Chilver (Queen's College, Oxford) defined the problem: at the peak of the bulge (1964–67) there will be at least 7,500 more applicants for university places each year; afterwards there will be a plateau, when the number of applicants will be at least 2,500 more than at present. This is calculated simply on the basis of the extra births in the years from 1944. In addition, there has been a trend towards more pupils aged seventeen years and more remaining at school, the increase since 1951 being 30 per cent in England and Wales and 15 per cent in Scotland. If this trend continues, then the numbers of applicants will be larger than the figures given. However, there are good reasons for believing that the trend is unlikely to operate during the peak of the bulge, though it may well be resumed in the later years.

The more important and tractable problem is that of the plateau. The universities should plan for an expansion of the order of 10–15 per cent in the 1960's, concentrated largely in science and technology. The Ministry of Education has provided places in secondary grammar schools to accommodate the extra children during the bulge, and there are signs that enough specialist teachers are coming forward for sixth-form work. The provision of additional university teachers is not so easily envisaged, since they must be found before the extra graduates are forthcoming; this is particularly so in science faculties, where the teachers will need to be withdrawn from other jobs. Capital development, to be in time to make the expansion possible, must take place earlier; it must be provided in the next quinquennium (1957–62). As regards the peak of the bulge, it may be unprofitable to speculate now, provided that planning proceeds for dealing adequately with the level of the plateau.

Exceptional difficulties are to be expected at Oxford and Cambridge, where it is unlikely that the expansion can be large, whatever may be desirable. This is a matter of fact, based on current views in the older universities, and is not a personal opinion. A major factor here is the existing system of college (as opposed to university) finance, the colleges not being directly in receipt of grants from the University Grants Committee. In any event, expansion in a city like Oxford is difficult, population growth being limited and college sites being too small for much further building. It is generally felt that, in view of their structure, colleges are reaching their maximum size. At the peak of the bulge, it is unlikely that Oxford and Cambridge will dilute their tutorial system to the extent tolerated after the Second World War; they are almost bound to raise their entrance standards.

In the second address, Prof. R. G. D. Allen (London School of Economics and Political Science) supported the contention that the problems of the plateau are more important than those of the peak of the bulge. He thought that 2,500 is a low estimate of the extra numbers the universities must soon absorb each year. Certainly a smaller figure would only arise if universities were to impose higher entrance standards or the economic climate in Great Britain deteriorate. The appropriate employment of 2,500 or so extra graduates a year raises special problems, but there can be no doubts about a ready market for scientists and technologists; for arts graduates also, even those with pass or general degrees, there are clear signs that there is an expanding market for their services, for example, in the Civil Service and local government, in banks and insurance offices. The likely recurrent cost of the expansion is not great—£3 million added to grants by the University Grants Committee and £2 million to maintenance awards—but the cost in capital grants is likely to be high and needs to be incurred early, particularly since much of the expansion must be in science and technology.

As regards the peak of the bulge (1964–67), the university population may well rise to more than

105,000, as compared with 50,000 before the Second World War and 80,000 now. The universities cannot easily absorb the peak numbers if they are concentrated heavily in science and technology, nor place them in employment unless they are so concentrated. But elaborate plans are not needed to meet the brief and passing phase of the peak. What is essential is that careful but generous plans should be laid during 1957–62 to provide for a university population at least 10–15 per cent higher than now, rising slowly and steadily during the late 1960's and 1970's as the trend towards more seventeen-year-olds at school operates. Prof. Allen also stressed the importance of maintaining the proportion of women (now about one-quarter) in the university population, and in this he was supported by Dr. C. M. Rigby (University College, London). The risk is that any strain in the universities, and the inevitable concentration on science and technology, will result in smaller numbers of women students.

Lord Simon of Wythenshawe, Prof. J. F. Allen (St. Andrews) and others stressed the extreme urgency of problems created by shortages of scientists and technologists in industry. Large numbers are reported as being trained in the U.S.S.R., and there is a growing scarcity in the United States, where British technologists are already being used. It is essential that in Britain we should not fall behind in the provision of technologists. Lord Simon noted that the universities have been able to achieve a large expansion since the Second World War, and he said that another increase, particularly of university-trained technologists, is now required.

Prof. A. V. Judges (King's College, London) asked the conference not to overlook the human side of the problem. The extra children of the post-war generation have already had a raw deal, through shortages of facilities, equipment and teachers, and they must not be barred from university education. They constitute an asset the country can ill afford to waste. Dr. G. B. Jeffery (director, Institute of Education, University of London) asked whether we are not failing to make best use of our population of university students. Jobs in industry are increasingly requiring a higher level of ability, and we are not turning out enough scientists and technologists even for teaching.

Two vice-chancellors, Sir James Mountford (Liverpool) and Sir Philip Morris (Bristol), expressed very strongly the view that the estimate of an expansion of 10–15 per cent is far too low. They would compound the effect of the higher birth-rate after 1944 with that of the recent trend towards larger sixth-forms in schools, the argument of the opening speakers providing the line from which to deviate—in an upward direction. Unless the estimate is raised, the plans of the universities will be too small, and too slow, to meet the real situation. The urgent need is for a large and immediate increase in capital grants to universities, and in this the Governments of the past decade have failed to provide what had been necessary, and indeed promised, for the expansion since the Second World War. Not only must the deficiency be made up, but there must also be full provision in capital grants for the expansion to come.

R. G. D. Allen

NEWS and VIEWS

Sir Edward B. Poulton, F.R.S. (1856–1943)

The son of an architect, Edward Bagnall Poulton was born at Reading a century ago on January 27, 1856. After taking first-class honours in natural science at Oxford in 1876, he became demonstrator of zoology under George Rolleston. Rolleston's successor, H. N. Moseley, supplied him with material from the *Challenger* Expedition, and in 1883 Poulton published three papers on the tongues of Australian mammals; five years later he discovered that Ornithorhynchus possesses true teeth which cut through the gums, but are replaced by horny plates. His real scientific interest lay in living insects, and he showed "a lifelong delight" in the coloration of animals and in mimicry. During 1884–88 he wrote several papers on the colours of larvæ and pupæ and on the factors influencing their survival value, and these studies led to his election to the Royal Society in 1889; in 1890 he published his classic book, "The Colours of Animals", which placed him in the front rank of protagonists of natural selection. Poulton's early interest in heredity is shown by an article in *Nature* (29, 20; 1883) on the inheritance of abnormal toes in cats. In 1893 he succeeded the first Hope professor of zoology, J. O. Westwood, and he occupied this Oxford chair of entomology for forty years. Recipient of many honours, he was vice-president of the Royal Society (1909–10) and Darwin Medallist (1914), president of the Linnean Society (1912–16) and Linnean Medallist (1922), and president of the second International Entomological Congress (1912). He was knighted in 1935. Poulton was a big man with penetrating blue eyes and a vigorous, friendly personality, and his fondness for making the title of a communication summarize all the contents sorely tried the patience of bibliographers. He died on November 20, 1943, at the age of eighty-seven.

Vice-chancellorship of Hull: Prof. Brynmor Jones

Prof. Brynmor Jones has been elected to be vice-chancellor of the University of Hull as from October next, in succession to Dr. J. H. Nicholson who is retiring. Prof. Brynmor Jones has held the G. F. Grant chair of chemistry in the University College (now University) of Hull since 1947. He has also acted as pro-vice-chancellor of the University since 1954 and prior to that was vice-principal of the College. Prof. Brynmor Jones was at the University College of North Wales prior to proceeding to St. John's College, Cambridge, in 1929. He was thereafter on the staff of the Chemistry Department of the University of Sheffield during 1931–46.

Theoretical Physics in the Australian National University: Prof. K. J. LeCouteur

The development of research in physics in Australia has been greatly strengthened by the appointment of Dr. K. J. LeCouteur to the chair of theoretical physics at the Australian National University, Canberra. Dr. LeCouteur, who at present holds a readership in theoretical physics in the University of Liverpool, has made important contributions to a variety of subjects. In recent years he has developed the theory of the emission of particles from excited nuclei to such an extent that it has become possible to use the relevant experiments for a quantitative determination of the density of energy-levels of nuclei. While occupied with this work, he has found time to develop quantitatively a method for the extraction of the beam from a cyclotron. This method has led to spectacular success on the Liverpool machine. Earlier in his career, he made interesting contributions to abstract field theory. Dr. LeCouteur's flexibility should be of great value in his new post and should help to start a new school of theoretical physics in Canberra.

Benjamin Franklin's Purse

In connexion with the 250th anniversary of the birth of Benjamin Franklin (1706–90), the Department of Mineralogy of the British Museum (Natural History) is exhibiting the asbestos purse sold by Franklin to Sir Hans Sloane in 1725. The purse came into the collections of the British Museum at the time of its foundation in 1753, on the death of Sir Hans Sloane. It had lain unrecognized for many years and was identified in 1938. On his arrival in Britain, Franklin worked for some time as a compositor and sought to augment his income by the sale of some 'curiosities' which he had brought with him from America. One of these, the asbestos purse, is referred to by Franklin in his autobiography, and also in a letter to Sir Hans Sloane, now preserved in the British Museum. The purse represents perhaps the earliest specimen of asbestos from North America to reach Great Britain.

European Organization for Nuclear Research

At a recent meeting in Geneva of the Council of the European Organization for Nuclear Research, a number of measures were approved. Two of these refer to a scheme of guest professorships whereby prominent workers are invited to spend a year in Geneva helping the research teams there: Prof. G. C. Wick, an Italian physicist at present at the Carnegie Institute of Technology, Pittsburgh, has been nominated for the guest professorship in theoretical physics and will act as leader of the Theoretical Group in Geneva; and Prof. W. K. H. Panofsky, director of the High-Energy Physics Laboratory of Stanford University, California, for the guest professorship in experimental physics. The estimates for the financial year 1956 and the capital investment programme for the period 1952–60 were approved by the Council. The budgetary contributions for 1956 have been fixed at about 34 million Swiss francs as compared with a figure of 25 millions for 1955. This year will be a period of great activity, and will involve a general move to the site at Meyrin, the installation of the laboratories and workshops, and the development of the scientific programme in relation to experiments with the machines. The staff will increase by about 40 per cent. By the end of 1960 the Organization will probably have spent about 197 million Swiss francs. Previous estimates were lower, but unforeseen problems were met in connexion with the stability of the foundations for the proton synchrotron; staff needs have also increased, and by 1960 about five hundred will be required. At the meeting of the Council the following officers were elected: *President*, Sir Ben Lockspeiser (United Kingdom); *Vice-Presidents*, M. Jacques de Bourbon-Busset (France) and Prof. Ivar Waller (Sweden); *Chairman of the Finance Committee*, M. Jean Willems (Belgium); *Additional Members of the Committee of Council*, Dr. Antonio Pennetta (Italy) and Prof. Paul Scherrer (Switzerland).

The Organization is planning to hold a symposium on high-energy physics in Geneva during June 11–23. The first week will be devoted to novel features in the design and techniques of high-energy accelerators, and this will be followed by papers and discussions on special experimental techniques (for example, bubble chambers) and new contributions to π-meson physics. Further information can be obtained from the Organization at Case postale 25, Geneva, 15-Aéroport.

Radiation Monitoring Service in Britain

The National Physical Laboratory radiation monitoring service, started for hospital staffs in 1942 at the request of the Ministry of Health, and extended in the following year to cover industrial workers, has grown steadily to the point where some 50,000 films are issued annually. In 1953 a new organization, the Radiological Protection Service, was set up under the joint auspices of the Ministry of Health and of the Medical Research Council to deal with general aspects of protection against ionizing radiations. This organization has now taken over the N.P.L. service. Initially the service will be operated by the Radiological Protection Service in a similar manner to that adopted by the National Physical Laboratory. The fee will be the same and also the procedure for supplying films and issuing reports. Inquiries should be addressed to the Director of the Service, Mr. W. Binks, at Downs Nursery Hospital, Cotswold Road, Sutton, Surrey (Telephone No. VIGilant 1329). The Service is also prepared to give advice on radiological hazards in general, and on the necessary protection measures for new installations involving such hazards. Future plans include the development of techniques for measuring accumulated radioactivity in the bodies of radiological workers.

U.S. Agricultural Research Institute

At the fourth annual meeting, held during October 17–18 in Washington, D.C., of the Agricultural Research Institute of the United States National Academy of Sciences and the National Research Council, the following officers were installed: *President*, Walter C. Dutton (Dow Chemical Co.); *Vice-President*, Max T. Goebel (E. I. DuPont de Nemours and Co., Inc.); and *Secretary*, Norman F. Kennedy (Corn Industries Research Foundation). The meeting included a paper on the strategy of research, by A. G. Norman, an address on the farmer and the future, by Ervin L. Peterson (U.S. Department of Agriculture), and a symposium on corn in the American economy; the proceedings will be issued shortly. The Agricultural Research Institute is composed of two types of members, those that pay subscription and those that do not, the former being industrial organizations and the latter scientific societies, agricultural experimental stations and Federal agencies. It is designed to foster the promotion of co-operative research that will ensure the best long-term uses of agricultural resources for the national welfare, and for this purpose it is affiliated with the Agricultural Board of the National Academy of Sciences and the National Research Council.

New Zealand Forestry Research

Some reorganization has taken place in forestry research in New Zealand, and the publication of *Forest Research Notes* and of *Forest Products Research*

Notes has now ceased. Their place is being taken by a new series, *New Zealand Forestry Research Notes*, published by the Government Printer, Wellington, which will report research carried out in New Zealand in any field of forestry by all types of worker—public, private, university, etc. The annual report of the Forest Research Institute, Whakarewarewa, will now be issued independently of any research series.

Pinus radiata forms a considerable proportion of the coniferous species constituting the new New Zealand forests and has been the subject of a great deal of research work. No. 1 of *New Zealand Forestry Research Notes* (pp. 72; 1955) treats of combined taper and volume tables for *P. radiata* for 1952 in unthinned stands in the Conservancies of Auckland, Nelson and Canterbury and in thinned stands in the fourth Conservancy of Southland. Technical Paper No. 4 of the Forest Research Institute (pp. 48) deals with some comparative tests with wood preservatives and covers work still incomplete for *P. radiata* that has been carried out in all four Conservancies.

Soil, Vegetation and Land-use Surveys in the Gold Coast

THE first of a series of memoirs to be published by the Gold Coast Department of Soil and Land-Use Survey, Kumasi, is a report, with detailed recommendations, on a "Detailed Soil Survey of the Kpong Pilot Irrigation Area" by H. Brammer (pp. 102+9 maps. Accra: Govt. Printer; London: Crown Agents; 1955; 10*s*.). It gives a survey of the irrigation research station on the Accra plains, where experiments are now being carried out to establish, among other things, the most suitable means for irrigating approximately three hundred square miles of tropical black clays. Besides reports on detailed surveys of development areas, this series is to include comprehensive reports and monographs on particular aspects of the systematic soil, vegetation and land-use survey of the country as a whole.

Chemistry Institute at Bogor, Indonesia

UNDER the Colombo Plan, Mr. H. J. Wood, chemist in charge of the food and drugs section of the Dominion Laboratory, Department of Scientific and Industrial Research, New Zealand, has been loaned for twelve months to the Government of Indonesia and will teach new methods of chemical analysis to the staff of the Chemistry Institute at Bogor. The Institute, which is in the grounds of the well-known botanical gardens at Bogor, covers a wide field of investigation; but its chief interests are the developing of the natural food resources of Indonesia and methods of control for quality—both processing and analytical control. There is a staff of two hundred; but only three of them are qualified chemists. Bogor contains a small European population, and besides the Chemistry Institute there are an agricultural institute and an American plant for the rubber industry.

Measurement of Rate of Dewfall

A PAPER by Dr. G. Hoffmann, published in *Berichte des Deutschen Wetterdienstes* (3, No. 18; 1955), discusses the thermodynamics of and meteorological conditions for dew formation, and then goes on to describe a novel instrument, invented by Dr. Hoffmann, for measuring directly the rate of dewfall based upon the release of latent heat to the body upon which the dew forms. The rate, of the order of 0·02 mm./hr., needs a very sensitive apparatus for its measurement. The apparatus consists of a series of separate radial sectors, the temperature differences between which can be measured thermoelectrically. One sector is unheated so that dew forms upon it, an adjacent one is heated at a certain rate H and a third sector on the far side of the second from the first at a rate $2H$. The temperature difference between adjacent segments is, in the steady state, proportional to the difference in the rates at which they are being heated, the constant of proportionality depending on wind and temperature. The arrangement gives the rate of dewfall as directly proportional to the ratio of two of the temperature differences. By using a fourth sector of different type of surface, the radiation balance can be measured and the heat conducted from the interior of the apparatus measured from temperature differences to obtain all the terms in the energy balance. A number of curves of rate of dewfall given by the instrument are reproduced, showing rates of dew formation and in some cases subsequent evaporation, amount of dew deduced from the sum of the rates, the radiation balance and the meteorological conditions. The correspondence between the records of dew formation and evaporation and radiation balance is good, but the computed dewfall showed sometimes marked differences from the total dewfall measured by a nearby Leick dew-plate which gives an amount from the volume of dew on the plate, the thermoelectric apparatus apparently giving totals about half those given by the dew-plate. Further improvements of the apparatus to provide an accurate picture of the nocturnal heat balance of the ground surface are envisaged.

International Association for the Exchange of Students for Technical Experience

THE continuing success of the scheme launched by the International Association for the Exchange of Students for Technical Experience in 1948 indicates that industry in many countries now appreciates the facilities offered for the general broadening of the outlook of the students taking part in the scheme by means of travel abroad, living and working with the people of other nations and, at the same time, obtaining some useful experience in the industry of another country. In 1955 the number of students taking part in the scheme was 5,153—an increase of 886 over 1954. More interesting is that, while, in 1948, 413 industries were participating in the scheme, in 1955 the number had risen to 2,314. Difficulties about establishing a central committee for the Association in the United States have now been overcome and in September 1955 the American Society of Engineering Education gave an official mandate to the Institute of Education for its sponsorship of the Association in the United States. India and Turkey joined the Association as associate members in January 1955, and it is anticipated that South Africa will join shortly.

Institute of Personnel Management

AN examination scheme for new entrants has been launched by the Institute of Personnel Management. The aim of the scheme is to widen the field of recruitment while ensuring that those recruited are suitably qualified for membership. The Institute will not organize any course of study; but students will be free to prepare for the examination by attending evening classes or by private reading. The choice of subjects is wide, so that people with different experience and knowledge may qualify. It will be difficult, however, for anyone who has not had practical experience in industry or commerce to reach the standard required in the two papers on personnel management and in the oral examination which, with an essay, form the compulsory part of the examination. Various qualified exemptions are allowed. The first examination was held in September 1955 and others will take place at half-yearly intervals.

Bernice P. Bishop Museum, Honolulu : Report for 1954

THE annual report for 1954 of the Bernice P. Bishop Museum, Honolulu, Hawaii (pp. 55 ; 1955), is issued under the attractive title of "Museum at Work". It is an impressive record of activities accomplished under rather isolated conditions and with the usual accompaniment of small staff and limited finance. It naturally concentrates on the presentation of a knowledge of the Pacific area to the public and research for the furtherance of the same policy, and to these ends it has recently installed an exhibit entitled "Insects Close-up", which deals mainly with the control of pests ; another display deals with the Hawaiian house and shows early ways of living. An innovation was Aloka week in the Museum, when a facet of Hawaiian history was presented in an authentic form. Several other special exhibits are described and illustrated. It is an impressive fact that 151 men and women volunteers gave 12,501 hours of their time to work in and for the Museum.

International Mixed Commission on the Ionosphere

THE proceedings of the fourth meeting of the Mixed Commission on the Ionosphere, held in Brussels in August 1954, have recently been published by the International Scientific Radio Union and are obtainable from the General Secretary of the Union at 42 Rue des Minimes, Brussels (pp. 238 ; 300 Belg. fr., £2 3*s*., or 60 dollars). This Commission comprises delegates from the International Scientific Radio Union, the International Union of Geodesy and Geophysics, the International Astronomical Union and the International Union of Pure and Applied Physics. The chairman of the Commission is Sir Edward Appleton, and Dr. W. J. G. Beynon, of University College, Swansea, is the secretary. At the Brussels meeting, which was attended by thirty-one individual delegates, the Commission discussed the ionospheric programme being prepared for the International Geophysical Year ; and also a wide range of papers describing research on the ionosphere and related subjects. Most of the scientific papers presented to the Commission are published in full in the *Proceedings*, together with summaries of the discussions at the individual meetings.

Announcements

PROF. T. G. COWLING, professor of applied mathematics in the University of Leeds, has been awarded the Gold Medal of the Royal Astronomical Society for his distinguished contributions to theoretical astrophysics and particularly for his work on the stability of stars.

PROF. LÉON BINET, professor of physiology in the University of Paris, has been elected vice-president for 1956 of the Paris Academy of Sciences.

MR. I. C. MCDOWALL, chief executive officer of the New Zealand Pottery and Ceramics Research Association (Inc.), has been appointed director of the Association. Mr. McDowall, who graduated from Victoria University College, Wellington, in 1944, has been on the staff of the Association since its formation in 1946.

DR. W. D'A. MAYCOCK, a member of the scientific staff of the Lister Institute of Preventive Medicine, has been given the 1955 award of £50 of the Oliver Memorial Fund for his contributions to the development of blood transfusion. Dr. Maycock is adviser in blood transfusion to the Ministry of Health and honorary consultant in blood transfusion to the War Office.

As in previous years, the British Association will rent tables during 1956 at the Marine Biological Station, Plymouth ; the Freshwater Biological Station, Windermere ; and the Zoological Station, Naples. Research workers wishing to use these facilities should write to the Secretary, British Association, Burlington House, London, W.1, giving their qualifications, the work intended and the dates required. Applicants should normally be members of the Association.

THE Food Group and the Oils and Fats Group of the Society of Chemical Industry are holding a conference on "Recent Advances in the Knowledge and Uses of Phospholipids in Foods", which will take place at the Wellcome Research Institute, 183 Euston Road, London, N.W.1, during February 9–10. The registration fee for the conference is 5*s*. for members of the Society and £1 for non-members. Registration forms, to be completed by February 6, and further information, can be obtained from the Assistant Secretary, Society of Chemical Industry, 56 Victoria Street, London, S.W.1.

THE Textile Group of Aslib, in co-operation with the Textile Institute, is organizing a conference on "Textile Information—Uses and Needs", which will be held at the Textile Institute, Manchester, on March 9. The objects will be to direct attention to the need for establishing and maintaining channels for the flow of technical and economic information to units and individuals in the industry best able to make use of it ; to indicate methods by which the communication of ideas and information might be most effectively achieved ; and to renew existing sources of textile information. Further information can be obtained from the Textile Institute, 10 Blackfriars Street, Manchester 3.

THE Cortina-Ulisse European Prize of one million lire (about £570), which is awarded by the magazine *Ulisse*, is being offered this year for a work on the history of labour organizations during the past century up to the First World War from scientific points of view. Only original works printed for the first time in Europe during the past five years will be eligible, and five copies should be sent in, before February 28, either by the author or by the publisher, to the Editor of *Ulisse*, Sezione Premio Europeo Cortina Ulisse, Corso d'Italia 43, Rome.

A MEMORIAL service for the late Sir Richard Redmayne will be held at 12.30 p.m. on January 26 at St. Margaret, Westminster. The service, which will be conducted by Dr. E. G. Jay, chaplain to the Archbishop of Canterbury, has been arranged jointly by the Institutions of Civil Engineers, of Mining and Metallurgy, and of Professional Civil Servants.

EUROPEAN ASSOCIATION OF EXPLORATION GEOPHYSICISTS

MEETING IN LONDON

THE European Association of Exploration Geophysicists has grown rapidly since its foundation in 1951 and now has a membership of more than a thousand, which is still increasing by about two hundred a year. For its ninth meeting the Association met in London at Church House, Westminster, during December 7–9, the distribution by countries of those attending the meeting being as follows: Great Britain, 123; France, 37; Germany, 22; United States, 13; Netherlands, 8; Italy and Yugoslavia, 4 each; Denmark, 3; Belgium, South Africa and Sweden, 2 each; Algeria, Austria, Canada, Eire, Japan, Norway, Spain and Switzerland, 1 each; total, 228. As these figures indicate, the Association takes a very elastic view of its territorial limitations, but the various members are united in their interest in applying the discoveries of physics to the exploration of the Earth's crust and its mineral resources.

The technical meeting was opened by Sir Edward Bullard, then director of the National Physical Laboratory, Teddington, who reviewed recent progress from the point of view of a geophysicist who has just renewed his interest in geophysics after several years in the field of 'un-prefixed' physics. He confessed to having been rather disappointed at the lack of any spectacular progress in geophysical methods during these years. At the same time, he directed attention to the many directions in which progress has been made, and where important developments may be imminent. This theme was taken up again later with more detailed treatment by Dr. R. G. Van Nostrand, who read a paper prepared in collaboration with Milton B. Dobrin on "Current U.S. Developments in Exploration Geophysics". Dr. Van Nostrand disagreed with Sir Edward, and expressed the view that important advances have already been made and are being vigorously applied in the field. He selected as most noteworthy the techniques of magnetic recording and velocity logging, both of which are rapidly entering everyday use in oil prospecting in the United States.

As pointed out by Sir Edward Bullard, the application of magnetic recording techniques to seismic exploration work has been facilitated by the developments demanded by guided-weapon research. The latter is now benefiting in turn by a wider market for high-quality recording apparatus. The advantages of making seismic records magnetically rather than photographically derive from the flexibility introduced by being able to reproduce the information again as electrical impulses. Then varying filters may be applied, or more novel methods under development, to improve the signal-to-noise ratio; time delays may be introduced by automatic correction techniques in order to facilitate interpretation; and lastly, and perhaps most important, the information can be conveniently stored against the day when better interpretation methods allow one to make the fullest use of the recordings, without having to re-shoot in areas which are often exceedingly difficult of access.

The continuous velocity logging of boreholes, continued Dr. Van Nostrand, offers not only greater convenience and speed than the conventional well-shooting, but also, by measuring the seismic velocity through much thinner layers, it gives the variations in velocity in much finer detail. The study of these continuous velocity logs in conjunction with seismic reflexion records shot from the surface is leading to a better understanding of the origin of reflexions. This in turn can lead to better resolution in complex geological situations, and may even afford a solution in some cases for the most challenging problem of present-day oil-finding, namely, the detection of stratigraphic trap reservoirs.

Although recent research in petroleum geophysics has been mainly concentrated on seismic techniques, Dr. Van Nostrand dealt also with several important developments in the application of other geophysical methods to mining exploration and to civil engineering problems. New borehole logging techniques have been applied to the search for uranium, an induced electrical polarization method has been successful in finding ground water, airborne electromagnetic methods have been widely used in the search for base metals in Canada, and a new airborne magnetometer has appeared, which is especially adaptable for use in light aircraft. Also, high-frequency seismic reflexion equipment has now been developed which offers hope for the successful application of reflexion seismology to mining geophysics and other problems involving structure at shallow depths.

The principles of the new airborne magnetometer were dealt with at greater length by G. Phillips and G. S. Waters, of the Signals Research and Development Establishment, Ministry of Supply. They have independently developed an apparatus, similar to that now in use in the United States, for measuring the magnitude of the total geomagnetic field from the frequency of precession of the protons in water around the field. (For a brief account of this work, see *Nature*, October 8, p. 691.) The advantages of this equipment for airborne magnetometer-surveying derive from light weight and simplicity, occasioned mainly by the fact that, unlike the flux-gate type of magnetometer, precise orientation in relation to the direction of the total field is not essential, so that sensitive servo-systems for this purpose are not required. Another advantage lies in freedom from instrumental drift.

The high-frequency seismic reflexion system was also given more detailed treatment at the meeting, its application and future possibilities being the subject of a paper by Curtis H. Johnson. Whereas reflexion equipment in common use at present employs frequencies in the range 30–60 c./s., the new equipment makes use of frequencies of the order 70–200 c./s. By this means the power of resolution is increased, at the expense, of course, of some increase in attenuation within the Earth. By using a faster recording speed and rapid automatic gain control, reflexion as early as 0·025 sec. after the shot can be satisfactorily timed, so that reflecting horizons as shallow as 100 ft. can be mapped. Besides its usefulness for the shallower problems of geophysics outside the petroleum industry, there are circumstances where high-resolution equipment can help the petroleum geophysicist. In areas where deep weathering or drift presents difficult low-velocity-layer correction problems, the reflexion times down to a known shallow marker-bed will give the necessary corrections for the deeper horizons. Other areas seem to be particularly favourable for high-frequency reflexions, so that more reflexions, and greater resolution between adjacent reflexions, can be obtained even at depths down to 5,000–6,000 ft.

A paper on instrumental distortion and the seismic record, by N. A. Anstey, attracted considerable interest. Taking a standard seismic input pulse—the Ricker velocity wavelet—Anstey has determined the various distortions of this pulse which arise due to filtering, automatic gain control, and high-amplitude effects in reflexion amplifiers. These distortions may affect the relative amplitudes, the shapes of the pulses, and the arrival times. Clearly, in the attempts which are now being made to use the reflexion method to the utmost limits of its resolving power, these instrumental effects must be fully understood, and in this respect Anstey's work is a most valuable contribution.

Out of the remaining twenty-three papers presented at the meeting, almost half dealt with the detailed mathematical and geometrical problems involved in the interpretation of geophysical results. Of these, the papers by F. Veyretout, M. Rimbaut, and by J. Schoeffler and L. N. Nardon were concerned with seismic reflexion problems; those by L. H. Tarrant and by S. Wyrobek dealt with refraction interpretation; those by A. H. Kleijn and by K. Helbig investigated the effects of seismic ânisotropy; while A. Lundbak, C. Monnet, A. Hahn and T. Knight gave papers on gravity and/or magnetic interpretation.

Considerable interest was attracted by three papers presenting the results of gravity determinations: the first, by F. A. Vening Meinesz and A. P. Collette, reported a regional gravity survey of the North Sea carried out by means of an underwater gravity-meter, with the co-operation of the Royal Netherlands Navy; another, by G. P. Woollard, W. E. Bonini and J. C. Rose, gave the latest results in their programme for the establishment of a world-wide network of gravity bases; and the third, by Rose and Woollard, described the measurements carried out from end to end of the North American continent with quartz gravity pendulums, with the object of establishing a gravity calibration baseline. Three papers dealt with seismic field-research: two of these, by T. Gaskell and by M. Pieuchet and H. Richard, were concerned with the efficiency of the customary source, that is, explosives either in a shot-hole or on the surface; and in the other, R. G. Mason described investigations of surface waves near the less commonly used alternative source, namely, a dropped weight. Actual field-surveys for mineral resources were the subject of two papers, one by M. Guerrier and A. Rogier on the Lorraine coal-basin, and one by R. Cassinis on exploration for sulphur limestone in Sicily.

The remaining four papers serve to illustrate the diversity of topics at the meeting. W. Domzalski dealt with problems of very shallow refraction work for civil and mining engineering purposes. F. Sumi treated some of the refinements of the electrical earth-resistivity method. Some novel ideas on the possible turning to advantage of seismic noise in prospecting were expounded by M. Matschinski. Lastly, very precise hydrostatic levelling for foundation problems was described by O. Meisser.

The meeting ended with a showing of the British Petroleum Company's film, "The New Explorers". Despite the many counter-attractions of London, attendance at the technical meetings was consistently high, showing that the meeting was most successful in furthering the interchange of geophysical knowledge and ideas. L. H. TARRANT

STRUCTURE OF SEMI- AND NON-CRYSTALLINE MATERIALS

THE autumn conference of the X-ray Analysis Group of the Institute of Physics was held in London at the Institution of Civil Engineers during November 18–19, the topic for discussion being "Semi- and Non-Crystalline Materials". In her opening paper, on the mechanism of crystallite growth in carbons, Dr. R. E. Franklin reviewed her work on the structure of graphitic and non-graphitic carbons. The latter can be further classified into graphitizing and non-graphitizing carbons according to whether crystallite growth can be induced by heat-treatment or not. From this fact, and from the nature of order produced during growth, certain conclusions about the mechanism of crystallite growth can be drawn, in particular when the graphitic sheets grow by the addition of edge groups and when growth is normal to the plane of the sheets. In discussing this paper, Dr. G. E. Bacon described his own work on radiation damage in crystalline graphite, where the order destroyed by irradiation can be completely restored by heat-treatment.

Dr. R. Diamond gave an account of a new theoretical method which he has developed for the interpretation of amorphous scattering curves, and which he has applied to the composition of various coals. Exact theoretical curves for the X-ray scattering from perfect condensed aromatic ring systems of various sizes were first calculated on the EDSAC digital computer. A linear combination of such curves was then fitted to each of the observed experimental intensity curves by the method of least squares, and from the coefficients in the combination histograms were obtained showing the proportions of the various ring systems present. This matrix method is to some extent analogous to the process of Fourier inversion; in cases such as this one, where all the possibly existing components are known, it avoids the difficulties due to cut-off and to the inaccuracies in the experimental curves at high values of $(\sin\theta)/\lambda$. The method has been applied by Dr. Diamond to a study of vacuum carbonization of coal, where the effects of polymerization and evaporation have been clearly shown. Dr. L. Cartz has used the same method on the vitrain series of coals and on ethylene diamine extracts of coals, and has derived histograms of molecular sizes, matching being carried out in the region of the (11) band. Discrepancies occurring between theoretical and experimental curves in the region of the (10) band can be explained as due to the (00*l*), that is, to intermolecular effects. Replying to questions by Dr. Stadler, Drs. Diamond and Cartz stated that they have also examined quinone extracts in which experimental and calculated curves do not agree; a chemical change during extraction is thought to have taken place.

Prof. R. W. Douglas reviewed some of the experimental work on the structure and physical properties of glass. The principal X-ray work in the subject, that of Warren and his associates on silica, and on soda-silica and boric oxide glasses has led to a concept of network-forming atoms and network-modifying atoms. The rather anomalous physical properties of boric oxide and sodium borate glasses have to some extent been explained by recent infra-red absorption measurements on these materials which have given important information on the bonds present. The

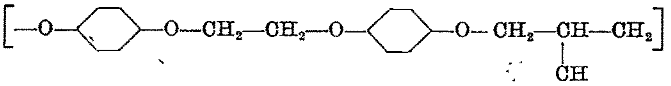
X-ray results have indicated the liquid-like structure of glasses, and, on the whole, their behaviour fits well into this pattern; much research, however, is still needed into the long-range order of glasses.

Dr. R. L. Gordon described X-ray measurements made by himself and his colleagues which indicate the presence of a disturbed layer, effectively about 1000 A. thick, existing at the surface of finely ground quartz particles which could be partly removed by etching, particles of diameter less than about 0·5μ apparently not containing any perfectly crystalline material. This conclusion was not universally accepted in the subsequent discussion, which, however, failed to produce an alternative explanation of Dr. Gordon's X-ray results; these were supported by other measurements such as differential thermal analyses. In discussing the papers on glasses and on quartz, Dr. A. E. J. Vickers described the difficulty of producing commercially truly isotropic fused silica.

Dr. W. May next gave an account of special X-ray diffraction techniques developed for obtaining patterns of liquid systems. His apparatus consists of a cylindrical powder-camera on the axis of which a free jet of liquid serves as specimen. The camera is kept filled with helium so that the pattern is practically free of unwanted scattering. The liquid is circulated by a pumping unit of the 'closed' type needing little attention, and interlocking safety devices between the X-ray unit and the pumping unit safeguard the operation of both. Provision has been made for working temperatures between 0° C. and 80° C.

Mme. J. Longuet-Escard described the work which she has carried out with J. Mering on colloidal nickel hydroxide. In settling from a fresh suspension, very small crystals of nickel hydroxide tend to stick together by their (001) faces. In this coagulation the ionic double layer of the surface is imprisoned, and non-rational (00*l*) reflexions are produced. The abnormal spacing (that is, the thickness of the imprisoned ionic layer) cannot be calculated from Hendricks's and Teller's formula, since its distribution in the stacking process does not follow a law of constant probability. The spacing can be determined directly by a Fourier transformation of the (00*l*) intensity distribution. The thicknesses thus measured were found to depend upon the nature of the anion and the state of hydration of the double layer. In the case of a chloride ion, spacings more than three times the normal spacing of nickel hydroxide (4·60 A.) have been found.

The final session of the conference was devoted to a discussion of non-biological fibres. Dr. L. Brown described preliminary crystallographic investigations on a polymer of repeating unit:



which may be prepared from 4,4'-dihydroxydiphenoxyethane and epichlorhydrin in the presence of sodium hydroxide. In the crystal the molecule is found to be twisted, probably S-shaped with the planes of the benzene rings at an angle to the chain axis. The crystallographic repeat is probably two molecular units, arranged around a two-fold screw axis. The symmetry is monoclinic with two chains (that is, four residues) in the unit cell. The interesting point about this structure is that the *b* (chain) axis extends reversibly from 27·6 A. to 29 A. on stretching, with only slight changes occurring in the diffraction pattern. Under suitable conditions the molecules may be drawn out to a straight form with a repeat of 16 or 32 A., but they do not appear capable of crystallizing in this form.

Dr. E. R. Howells next presented the results of X-ray examinations carried out by Mr. C. W. Bunn and himself on straight-chain fluorocarbons, particularly on 'Fluon', polytetrafluoroethylene. The fluorocarbon chains, both in 'Fluon' and in perfluorocetane, $C_{16}F_{34}$, were found to have a helical configuration with six turns in the repeat unit of thirteen (CF_2) groups. On account of the relatively large van der Waals radius of 2·7 A. of fluorine, the cross-section of the fluorocarbon chain is very nearly circular, and it should therefore be easy for chain segments to rotate about their own axes. This rotation probably accounts for the remarkable room-temperature transition which occurs in 'Fluon' some 300 deg. below the melting point; as Mr. Bunn pointed out in a reply to a question, the rotation may also be the explanation of the remarkably low coefficient of friction of the polymer: the cylindrical molecules may be acting as roller bearings.

Dr. A. Keller has been studying orientation phenomena in synthetic crystalline polymers, where the crystallites do not appear in a haphazard way, but form sub-microscopic fibrous aggregates. These fibrils themselves can build up larger structures, the spherulites, within which they are essentially radially disposed. Thus a polymer which is macroscopically unoriented is in fact composed of minute oriented regions which arise spontaneously from melt or solution. Dr. Keller has studied the orientation of the unit cell within these regions by means of a micro X-ray technique and found it to be such as to result in a predominantly perpendicular disposition of the chains with respect to the radii of the spherulites. In certain special cases the X-ray results have been correlated with birefringence measurements. The existence of these spontaneously oriented regions can manifest itself when a crystalline or crystallizing polymer is artificially oriented. A number of uniaxial orientations were observed which are unusual since the molecular chains are oriented preferentially in directions other than that of the external orienting influence. While this is unexpected from simple molecular considerations, Dr. Keller showed that the anomaly is only apparent and that the actual orientations fit in well with his picture. Prof. J. D. Bernal pointed to a possible similarity between Dr. Keller's spherulites and those observed, although of a much larger size, by Dr. Conmar Robinson in solutions of synthetic poly-γ-benzyl-L-glutamate.

In a short contribution, Dr. K. Dornberger-Schiff gave examples of the type of misalignment and 'mistakes' occurring in semi-crystalline material in which only a two-dimensional periodicity is retained. Such structures are best treated by considering the planar symmetry of the two-dimensionally ordered regions rather than by space-group theory. Important examples of the type of treatment suggested by her are afforded by certain fibrous minerals, notably chrysolite, halloysite and garnierite, which Dr. E. J. W. Whittaker has been examining. He has found that, while these minerals do not possess crystal lattices of the ordinary kind, their structures can be described in terms of cylindrical lattices. He defined a cylindrical lattice as a set of congruent two-dimensional lattices inscribed on a set of cylindrically curved surfaces and mutually ordered with respect to the cylinder axis, there being equal and uniform normal spacings between each successive pair of such surfaces; he then developed a classification of such lattices which is a cylindrical analogue of ordinary space-group theory.

Dr. D. E. Corbridge reported on his structure analysis of the fibrous 'Kurrol' salts, which are long-chain metaphosphates; they are insoluble and exhibit colloidal behaviour. In the case of rubidium metaphosphate, the unit cell is monoclinic and contains continuous chains of composition $(PO_3)_n^{n(-)}$ spiralling around the screw axes with a repeat pattern every two PO_3 units; similar structures have been found for the potassium and cæsium salts. Dr. Corbridge pointed out some interesting structural resemblances between the metaphosphate chain and long-chain anions found in certain silicate minerals which also form helical structures.

An interesting and stimulating evening discourse was delivered during the conference by Prof. A. R. Ubbelohde, whose subject was "Crystallography and the Phase Rule". The next conference of the Group will be held jointly with the Low Temperature Group of the Physical Society; it will take place in Oxford during April 11–13 and will be devoted to low-temperature crystallography. U. W. Arndt

DENSITY OF THE LUNAR ATMOSPHERE

SOME of the values of the density of the Moon's atmosphere obtained by observers in the U.S.S.R. are discussed by E. J. Öpik, of the Observatory, Armagh, in a paper in the *Irish Astronomical Journal* (3; March 1955). The Russian workers determined the relative polarization of the diffuse light of the sky near the horns of the lunar crescent and they arrived at a value approximately $0{\cdot}5 \times 10^{-4}$ of the terrestrial atmosphere, but A. Dollfus in 1952 found a value 10^{-9} for the upper limit (*C.R. Acad. Sci., Paris*, 234, 2046; 1952). J. N. Lipskij carried out a detailed investigation and arrived at a value of the order 10^{-4} (*Pub. Sternberg Astro. Inst., Moscow*, 22, 66; 1953), but Öpik's examination of the matter shows that the values obtained by the Russian observers must be far too big.

In his investigations, Öpik completely ignores any possible absorption by the hypothetical lunar atmosphere, which is too thin to cause absorption effects, and hence the surface brightness in a given direction will be proportional to the intensity of illumination and to the illuminated air mass per unit cross-section along the line of sight. On this assumption, he shows that the surface brightness of the earth-shine at quarter phase is at least thirteen times as great as that of a vertical column of the lunar atmosphere illuminated by the Sun, and this result is used to determine the upper limit to the mass of the lunar atmosphere. It seems highly probable that any lunar atmosphere (if such exists) will be practically free of dust, and Raleigh scattering of light by the gas molecules prevails. It is assumed that the scattering power of the lunar atmosphere is about the same as that over high mountain tops, such as Mount Whitney (4,420 m. above sea-level), and C. G. Abbot's observations on Mount Whitney (*Ann. Astrophys. Smithsonian Inst.*, 3, 145; 1913) showed that the surface brightness of a sunlit atmosphere at sea-level, but of a degree of purity equal to that on Mount Whitney, is $3{\cdot}02 \times 10^{-7}$. The surface brightness of the earth-shine, measured by Öpik in 1924 and by Danjon in 1936, is about 25·84 mag., from which it is easily found that the surface brightness of earth-shine is $4{\cdot}61 \times 10^{-11}$. The ratio of the lunar to the terrestrial atmospheric masses in vertical columns of unit cross-section is therefore less than $4{\cdot}61 \times 10^{-11}/13 \times 8{\cdot}02 \times 10^{-7}$—that is, less than $4{\cdot}42 \times 10^{-6}$—making use of Öpik's figure thirteen, as already explained earlier.

It appears from this investigation that the mass of the lunar atmosphere is less than 1/226,000 of the terrestrial, and with the smaller gravity on the Moon, the pressure and density of the lunar atmosphere cannot be more than one part in 1·3 millions of those of the terrestrial atmosphere.

INSECTICIDES AND THE BALANCE OF ANIMAL POPULATIONS

DR. H. E. HINTON, of the Zoology Department, University of Bristol, has recently directed attention to the dangers involved in the indiscriminate use of insecticides (*Sci. Prog.*, 43, No. 192; October 1955).

Much has been written on the kinds of direct injury that can be done to crops and other useful plants by insecticides, while individuals using poisons are materially concerned with any damage they may do to farm animals, crops and ornamental plants. They are not always as interested in the damage they may do to wild animals and birds, and they occasionally tend to dismiss injuries to their operatives as unavoidable occupational hazards. For example, in Argentina the incidence of dermatitis in workers exposed to BHC was once as high as 25 per cent. Fish are said to be as sensitive to DDT as insects; but the possibility of producing damaging concentrations in water as the result of normal control operations is slight.

In 1952 many instances of death or serious injury following the use of DDT, BHC and other chlorinated hydrocarbons had been reported. The chlorinated compounds which are fat-soluble and chemically stable tend to accumulate in the fatty tissue; this explains why animals with a large amount of fat tend to be less susceptible to acute poisoning than under-nourished ones. It has been shown that, in mammals, accumulation occurs at all ordinary levels of intake, and rats may accumulate DDT in the fat body until there may be as much as thirty times the level of intake. More DDT may accumulate in the fat body than is required for a lethal intravenous dose without the mammal showing any obvious signs of poisoning. Elimination occurs slowly; but sudden starvation may release enough DDT to affect the animal seriously. It is also known that there are great seasonal differences in the susceptibility of insects to chlorinated compounds, and there is good evidence that these seasonal differences are related to the amount of depot fat present. Many investigators believe DDT should not be used on dairy cattle and animals that are to be eaten because it accumulates in the milk and fatty tissues.

THE SECOND ENTOMOLOGICAL EXPEDITION TO THE HIMALAYAS

By PROF. M. S. MANI

School of Entomology, St. John's College, Agra

DURING May–June 1955 I led the Second Entomology Expedition to Lahoul-Spiti in the North-West (Punjab) Himalayas. There were a team of seven members and more than a ton of equipment and supplies of food. The University of Agra made a small grant towards a part of the expenses of the Expedition. Leaving Agra on May 18, we reached Manali at the end of the Beas Valley. Owing to unexpected and unusually late snow-fall, we were greatly delayed and held up for several days at about 9,000 ft. Our original plan of establishing a supply base at about 15,000 ft. on Kanzam La in the Spiti border had to be abandoned. The base camp was established a little below 13,000 ft. in a meadow opposite the Kulti Nal glaciers. After overcoming numerous difficulties and considerable delays, some essential supplies were pushed to an advance base camp below the Great Ice Fall Mountains of the Purana Khoksar Nal. Although not specially organized for spectacular peak-climbing, the Expedition climbed several unnamed and unclimbed peaks in search of high-altitude insect life.

Although the climbing programme had to be greatly curtailed owing to continued bad weather, more than five thousand specimens were brought back, some of them being taken at altitudes never before reached by an entomologist in this part of the Himalayas. We also studied the various conditions under which the high-altitude insect life flourishes and made observations on the habits and peculiarities of life-cycles. Several hundred close-ups in 'Kodachrome' and black-and-white were also made of the high-altitude flowers and insects in their natural surroundings with the help of a 'Leica' camera and its accessories.

The collections, which will ultimately be deposited with the Zoological Survey of India, are now being sorted out and card-indexed. Nearly every specimen has been microfilmed. The identification of the material, descriptions of the new forms and detailed reports of the Expedition's findings will not be ready for some time. I may, however, direct attention to certain interesting features of the high-altitude insect life of the Himalayas.

Although the variety and abundance of insect life as a whole rapidly fall off beyond the limits of tree-growth, the zone of permanent snows immediately above these limits is by no means barren. On the permanent snow at altitudes rarely ever reached by ordinary human beings, there habitually live a remarkable variety of insects. They thrive well under conditions of glare (great radiation especially in the ultra-violet part), intense cosmic-ray activity, reduced pressure, great oxygen deficiency, constant fierce cold-dry winds, frequent avalanches and snowstorms, absence of plant life, relative scarcity and lack of variety of food and restriction of the feeding period to the very brief summer, etc. Dry barren rock that often gets heated to an uncomfortable degree in the summer sun even at great elevations, damp moss-covered stones, snow-fields, glaciers, glacial torrents, cracks and crevices in rock, caves and other spots have each their characteristic insect inhabitants.

While nearly every order of insects with which we are familiar in the plains also occurs at high altitudes, the species are different in almost all cases. The high-altitude insects of the Himalayas superficially resemble the alpine type; but actually they show closer affinities to the Tibetan and Central Asian faunal elements rather than to European. There are also sufficient indications to believe that the insects of this region represent, at least partly, a geographical relict of the Pleistocene life of Central Asia. Deep infiltrations of the subtropical and often also of the tropical faunal elements may be detected as high as 10,000 ft. above the mean sea-level.

Among the high-altitude insects of the Himalayas, Collembola, Diptera, Coleoptera, Dermaptera, Plecoptera and Ephemerida (given in order of abundance) stand foremost. Between 8,000 and 14,000 ft., Plecoptera, Ephemerida and Trichoptera are dominant types, especially in the glacial torrents. Some of these ascend right up to the edge of the permanent snow. Remarkably enough, the insect population of all kinds is far more dense in the glacial torrents than in stagnant waters. This concentration in the torrents is perhaps due to the more uniform though lower temperatures of the torrents than in the still waters. From 12,000 ft. upwards we come across Dermaptera–Coleoptera associations, and beyond 15,000 ft. above sea-level Collembola, Coleoptera and Diptera replace the Dermaptera–Coleoptera complex. The last-mentioned three orders seem to have successfully taken up permanent abode at much higher altitudes than any other insect and also occur at greater elevations than 15,000 ft. Collembola are perhaps the only forms which may be found as high as 18,000 ft.

In addition to the species that occur habitually at great altitudes, the Expedition came across great swarms of migrating Lepidoptera. *Colias ladakensis* and *Argynnis claudi* were taken at about 17,000 ft. on snow-fields. Upper-air currents and the afternoon winds blow up millions of minute insects like aphids, fruitflies and even larger forms like noctuid moths from the plains of India on to snow-fields and glaciers between 14,000 and 17,000 ft., especially on the southern aspect.

A most remarkable variety of adaptations can be correlated to the peculiar conditions of life. Widely unrelated groups occurring on exposed boulders, in glacial torrents and on wind-blown snow-fields and glaciers exhibit considerable adaptive convergence in the development of devices for securing firm anchorage. The great majority of the truly high-altitude insects show extremely low tolerance of even slight increase in temperature, due undoubtedly to long acclimatization to the generally sub-zero temperatures. Some of them are capable of surviving under 30 ft. of snow for several months without apparent harm.

A striking feature of the high-altitude insects of the Himalayas is the greatly prolonged larval life, with hibernation and diapause often extending to one or even two years. The adult is extremely short-lived. We came across a great number of forms still hibernating towards the end of June under stones covered by several feet of snow. *Calosoma madeirae kashmirense* is, for example, a common carabid beetle that was hibernating in this way at about 13,000 ft. On an enormous glacier at about 14,000 ft. on the Dhauladhar I found on a previous occasion a mass assemblage of hibernating adults of Coccinellidæ. At relatively lower altitudes just beneath the permanent snow line, with the advance of summer and the gradual melting of the snow, the scene becomes one of a mad race of different species against time. The noon-day sky with the air 4° below zero becomes filled with gigantic swarms of may-flies, stone-flies, caddis-flies, butterflies, gnats and various other insects which mate, lay eggs and perish before the same evening. The few that survive may be destroyed in a blizzard the next afternoon. Unlike polar forms, most of the high-altitude insects here are heavily pigmented as a protection against the glare and ultra-violet radiation. This may also be the result of crowding during development in sheltered spots. While only a small fraction of them thrive on lichen, moss or algal slimes, the great majority of the species are either scavengers or carrion feeders or devour each other. As one goes higher and higher the increasing proportion of the carnivorous species can be recognized, until at altitudes above 15,000 ft. they are the only types that occur permanently. The wind-borne organic matter already referred to also contributes to the food resources of the high-altitude insect life.

A MODIFIED METHOD OF TWO-DIMENSIONAL ZONE ELECTROPHORESIS APPLIED TO MUCOPROTEINS IN SERUM AND URINE

By R. L. MARKHAM

Department of Rheumatology, Royal Free Hospital, London

DURRUM[1] has described a technique of two-dimensional zone electrophoresis on paper in which the analysis in the first buffer is transferred on a strip of paper to the surface of a sheet of paper soaked in the second buffer. The strip is placed in such a position that the substances on it migrate in a direction at right angles to that in the first buffer. We wished to use two-dimensional electrophoresis to obtain direct confirmation of the positions of serum mucoprotein fractions in the serum protein pattern obtained by electrophoresis at pH 8·6. Two serum mucoprotein fractions may be isolated from all other serum proteins by electrophoresis at pH's between 4·4 and 4·6[2] (Fig. 1). Since in the latter technique filter paper is sandwiched between glass plates, the following modification of Durrum's method was developed.

Instead of placing the strip on the surface of the paper, a slot to receive it of corresponding width and slightly greater length was cut in the centre of the second sheet at right angles to the direction of the second separation. The strip was partially dried at room temperature before being placed in position. The edges of the two pieces of paper were then carefully teased together, except at either end of the strip where a gap was left. The sheet of paper had been soaked in buffer, blotted, and placed on the lower glass plate before receiving the strip, and the flow of the new buffer into the strip concentrated the material in it as a narrow band along its centre. The absence of buffer flow inwards at either end of the strip prevented disturbance of spatial distribution along it. The upper sheet of glass was then placed over the paper, the second electrophoresis carried out after a short period of equilibration, and the paper—minus the strip—was then stained. The results obtained are shown in Fig. 2 (A). The occurrence of M-1 and M-2 in the α_1- and α_2-globulin positions respectively is clearly indicated. The pH of the second buffer is chosen to ensure that the fractions to be studied are carried clear of the transferred strip. With other combinations of buffer systems the buffer on the strip may alter the pH on the remainder of the paper; but this can generally be avoided by adjustment of the buffer concentrations or by transferring a narrower strip.

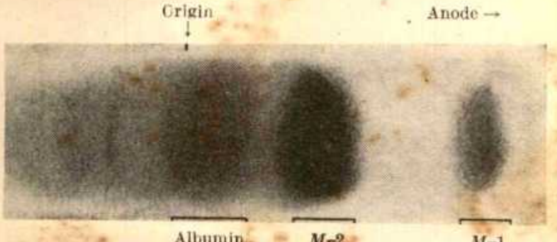


Fig. 1. Serum mucoprotein fractions M-1 and M-2 isolated by electrophoresis at pH 4·6 in a citric acid – sodium phosphate buffer. Paper stained by periodic acid – Schiff technique

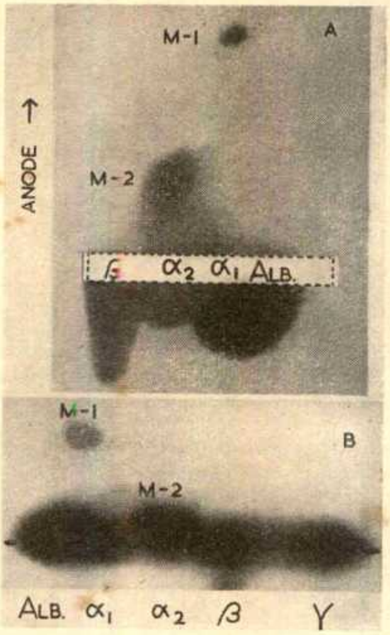

Fig. 2. Two-dimensional electrophoresis showing position of mucoprotein fractions in serum protein pattern obtained with veronal buffer, pH 8·6

(A) First separation transferred on paper strip, position of strip indicated by dotted line. Second buffer citric acid – sodium phosphate, pH 4·4

(B) Veronal buffer removed by 66 per cent acetone, second buffer citric acid – sodium phosphate, pH 4·6

Stained with naphthalene black. M-1 spots intensified for reproduction

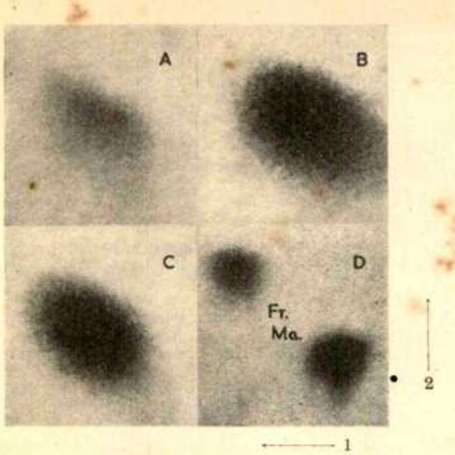

Fig. 3. Details of shapes of spots obtained by two-dimensional electrophoresis. Arrows indicate direction of migration in first and second analyses

	Substance	Buffer *p*H 1	Buffer *p*H 2	
A	Serum, *M*-2	8·6	4·6	Stained with naphthalene black
B	Urine, *M*-1	8·6	4·4	,, ,, ,, ,,
C	Serum albumin	8·6	8·6	,, ,, ,, ,,
D Fr.	Fructose	8·6	8·6	Detected with *m*-phenylenediamine. Borate buffer
D Ma.	Mannose	8·6	8·6	,, ,, ,, ,,

Both electrophoretic analyses can be carried out on the same sheet of paper when serum mucoproteins are being studied, since veronal buffer may be removed by washing the paper in ice-cold 66 per cent acetone. The mucoproteins are not denatured by acetone, and the low temperature and rapid removal under vacuum avoid excessive denaturation of the other proteins present, which, if rendered insoluble, might retain some of the mucoprotein. The results of such an analysis are shown in Fig. 2 (*B*).

In the course of these experiments it was noticed that fractions appearing to be homogeneous after one electrophoretic analysis gave, after a two-dimensional analysis, elliptical spots with their long axes at an angle to both directions of migration (Fig. 3). This was observed with both mucoprotein fractions, run either at two different *p*H's or twice at the same *p*H, and with serum albumin run twice at *p*H 8·6. In a two-dimensional analysis using borate buffer at *p*H 8·6 [3], fructose and mannose showed no tendency to form spots of this nature (Fig. 3). The transferred strip technique was used in all these two-dimensional analyses, and both serum and urine were obtained from patients suffering from acute rheumatoid arthritis. The shapes of spots were not influenced by position on the paper, or by the order in which the buffers were employed. Kunkel and Tiselius[4] suggested that these diagonally disposed elliptical spots are the result of the presence of components with different mobilities within what appears to be a homogeneous fraction when subjected to a single electrophoretic analysis, and that the presence of such a spot-shape is a sensitive test for heterogeneity. No heterogeneity of these two mucoprotein fractions or of serum albumin was detected when patterns obtained by a single electrophoretic analysis were scanned, the curves obtained showing no sign of containing more than one component.

In the method reported here, where the same buffer has been used for each analysis, the fact that the axis of the elliptical spot is not at 45° to each direction of migration is due to the concentration of the spot on the base line before the second analysis. This reduces in one direction only the effect of diffusion on the shape of the spot. Kunkel and Tiselius were not able to demonstrate the heterogeneity of serum albumin by their method, and the ability of the method here described to do this may also be due to this reduction of diffusion by reconcentration, resulting in a more sharply defined spot.

Serum albumin[5] and mucoprotein *M*-2 [6] are each known to contain several components, but only one component is known to occur in mucoprotein *M*-1 of normal serum[7], and in normal serum a round spot is obtained on two-dimensional electrophoresis of the latter fraction. The intensity of this spot was too low for photographic reproduction. *M*-1 in serum of patients suffering from active rheumatoid arthritis, however, gives a diagonal ellipse and has been reported as containing two components, detected by boundary electrophoresis[8].

I thank Dr. Ernest Fletcher and the Board of Governors of the Royal Free Hospital for permission to publish this communication, and the Endowment Fund Sub-Committee for providing facilities. [Sept. 22

CYCLIC POLYAMIDES FROM NYLON 6 and 6.6 POLYMERS

Constitution of the Cyclic Polyamides isolated from Nylon 6 Polymers

In a previous paper we reported the isolation from technical ε-caprolactam polymerizates of three individual crystalline substances (designated here as *A*, *B* and *C*) having identical elementary composition ($C_6H_{11}ON$) and containing no free NH_2 or COOH groups[1]. They obviously represent cyclic oligomers of ε-caprolactam.

Cryoscopic molecular-weight determinations in phenol at a concentration of about 5 per cent (by weight) led us to conclude that *A* and *B* are stereoisomeric cyclic dimers and *C* a cyclic trimer (molecular weight found for *A* and *B* 212 and 250; for *B* 342; calc., 226 for dimer and 339 for trimer).

A private communication received from Dr. L. Valentine in Leeds expressed doubt as to the reliability of the cryoscopic molecular-weight determinations (owing to the fact that no extrapolation to zero concentration was included). This led us to seek an independent method of determining the constitution of these compounds. Stepwise hydrolysis in aqueous (25 per cent by weight) hydrochloric acid at 110° (at a concentration of 0·5 repeating units, "Grundmole", per litre) was chosen. This procedure was recently also suggested by Zahn *et al.*[2]; but no definite results were communicated.

Upon hydrolysis, a cyclic *n*-mer should produce the linear *n*-mer as the first product, which then is transformed into the linear (*n*–1)mer and so on, until complete conversion into ε-aminocaproic acid is reached.

A paper chromatographic technique[3] allowed us to separate, identify and estimate approximately quantitatively mixtures of the lower linear oligomers up to the tetramer.

Applying this technique, which will be published elsewhere in more detail, it was found that the intermediate product first appearing in the hydrolysis of the cyclic oligomers *A*, *B* and *C* were the linear dimer, trimer and tetramer respectively, providing conclusive evidence that *A*, *B* and *C* are indeed the cyclic dimer, trimer and tetramer.

The results of our hydrolysis experiments are in conformity with the extensive cryoscopic molecular-weight determinations of the same substances in solvents other than phenol (lactam of hexahydro-*p*-aminobenzoic acid and acetanilide) recently published by Rothe and Rothe[4]. These authors also confirmed anomalous results obtained in phenol as a solvent. It remains to be explained why the melting-point depressions of these substances in phenol are abnormally high.

The properties of these cyclic oligomers can now be summarized thus :

Substance	*A*	*B*	*C*
Melting point (corrected)	347–348°	247–248°	241–242°
Solubility in water, parts per 100 (17°)	0·1	0·93	0·04
Former designation (ref. 1)	α-dimer	β-dimer	trimer
Correct designation	dimer	trimer	tetramer
Molecular weight, cryoscopic method (ref. 4)	225	336	439
Molecular weight, calculated	226	339	452

The paper chromatographic identification of the linear oligomers was facilitated by samples of the synthetically prepared compounds obtained by courtesy of Dr. Van der Want, Central Laboratory TNO, Delft[5].

Intramolecular Hydrogen Bonds in certain Cyclic Polyamides

The intermediate products formed in the hydrolysis of the cyclic oligomers of ε-caprolactam and some linear oligomers of ε-aminocaproic acid (in a large excess of 25 weight per cent hydrochloric acid at 110°) have been identified and semi-quantitatively determined.

A paper chromatographic technique[1] has been used for this purpose. The results allowed determination of the approximate values of the pseudo first-order hydrolytic rate-constants of the amide groups in these substances. (The theoretical and experimental details of this work will be published elsewhere.)

The kinetic analysis of the hydrolysis of the linear oligomers was simplified by the assumption that the rate-constants of the amide groups in these linear polyamides are independent of chain-length and location in the chain, which seemed justified by a previous investigation[1].

Included in this investigation was also a cyclic diamide isolated from nylon 6.6 polymerizates obtained by courtesy of Dr. R. J. W. Reynolds (Manchester). This substance, which on hydrolysis yields the linear monoamide $NH_2(CH_2)_6NHCO(CH_2)_4COOH$ as an intermediate and hexamethylene diamine plus adipic acid as the final products, is isomeric with the cyclic dimer of caprolactam.

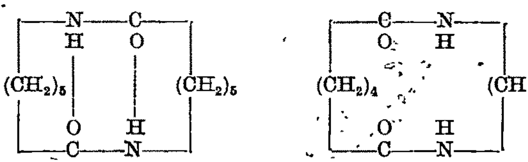
The approximate hydrolytic rate-constants in h^{-1} (for one amide group) of the substances investigated are given in Table 1 along with their solubilities in water at room temperature.

Table 1

	Rate-constant (h^{-1})	Solubility (parts/100)
Caprolactam cyclic dimer	0·025	0·1
,, ,, trimer	0·21	0·93
,, ,, tetramer	0·15	0·04
Nylon 6.6 cyclic monomer	0·34	2·35
Linear ε-aminocaproic acid oligomers	0·34	—
ε-Caprolactam	> 2	320

These results disclose some interesting features. It is seen that the amide groups in caprolactam cyclic dimer are very resistant to hydrolysis as compared to those in the other cyclic lactam oligomers, and, in particular, as compared to the amide groups in the isomeric nylon 6.6 cyclic monomer, which react with practically the same rate as the amide groups in linear chains. Also the solubility in water of the nylon 6.6 derivative is more than twenty times larger than that of the lactam dimer. This peculiar difference requires explanation.

It would seem that the low reactivity of the cyclic dimer can be understood from the fact that in this compound the two CONH groups can readily assume a position opposite to each other, which is particularly favourable for the formation of two intramolecular hydrogen bonds, whereas in the nylon 6.6 derivative the different sequence of CO and NH groups does not permit a configuration equally favourable for the formation of internal hydrogen bonds. This can be represented diagrammatically thus :



Cyclic dimer Nylon 6.6 monomer

Examination of Stuart models corroborates this view.

In the cyclic trimer, only two out of the three CONH groups could possibly form intramolecular hydrogen bonds with each other, and it seems to be not merely accidental that this oligomer is the one having by far the largest solubility in water. It also hydrolyses much easier than the dimer.

In the tetramer, pairwise engagement of all the CONH groups is again geometrically possible. Stuart models show that this is even possible in two different ways (Fig. 1).

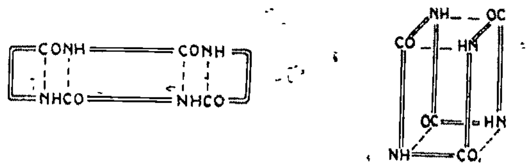


Fig. 1

The fact that its rate-constant is nevertheless much larger than that of the dimer and but slightly smaller than that of the trimer is presumably related to the very much larger internal mobility of this 28-membered ring-system, which is also clearly demonstrated by the Stuart model. This mobility may favour the existence of a great many conformations in which the amide groups lie too far apart to allow intramolecular hydrogen-bond formation. The number of such conformations is undoubtedly much larger than in the dimer.

This paper and the preceding form part of a programme of fundamental research sponsored by AKU (Arnhem) and Netherland States Mines (Geleen).

Constitution of the Cyclic Polyamides isolated from Nylon 66 Polymer

WHEN nylon 66 polymer (polyhexamethylene adipamide) is heated in a glass vessel under an inert atmosphere above its melting point, a white crystalline sublimate condenses on the cooler parts of the vessel. A similar phenomenon occurs in the melt-spinning of nylon, when a sublimate condenses on the cooler parts of the spinning equipment just below the spinneret. It was obviously of interest to know whether this material was a by-product of the polymerization process or of thermal decomposition of the polymer.

A sample of the crystalline material sublimed out of nylon 66 polymer by heating it under vacuum at 295–300° C. was found to have a melting point of 249–251° C. (uncorr.): its analysis showed 63·6 per cent C, 9·8 per cent H and 12·4 per cent N (calc. for $C_{12}H_{22}N_2O_2$, 63·8 per cent C, 9·75 per cent H and 12·4 per cent N). This material had refractive index of 1·554 and density of 1·166 gm./c.c.

In some later work, nylon 66 polymer was extracted by boiling with water for a long period and the aqueous extract evaporated to dryness. The residue was found to comprise two materials—one soluble in ethyl acetate, from which it crystallized, and the other insoluble; the insoluble portion was purified by recrystallization from methyl 'Cellosolve'.

The material soluble in ethyl acetate was found to be identical with the material which had been sublimed from 66 nylon polymer. Its melting point was 248° C. and by analysis was found 63·3 per cent C, 9·6 per cent H and 12·2 per cent N. Molecular weight determination gave 210 (by cryoscopic method in phenol), 218 (by ebullioscopic method in methanol) and 225·2 by X-ray diffraction assuming two molecules per unit cell. The dimensions of the triclinic unit cell were $a = 9·58$ A.; $b = 8·71$ A. and $c = 8·47$ A., with angles $\alpha = 110° 58'$; $\beta = 104° 35'$ and $\gamma = 86° 17'$. The specific gravity of the crystals, measured by flotation, was 1·171. The calculated molecular weight for $C_{12}H_{22}O_2N_2$ is 226.

The material insoluble in ethyl acetate crystallized from methyl 'Cellosolve' in fragile white crystals with melting point 237° C. On analysis its composition was found to be 63·2 per cent C, 9·6 per cent H and 12·2 per cent N. Molecular weight determination (by ebullioscopic method in methanol) gave 445.

The crystals were not good enough for unit cell measurements to be made, but the powder diffraction pattern was different from that of the soluble fraction in ethyl acetate.

It seemed probable that these two compounds were cyclic hexamethylene adipamide monomer and dimer respectively.

It is possible to obtain a mixture of low-molecular weight materials comprising mainly these two compounds by dissolving 66 polymer in formic acid and adding the solution slowly to a large volume of methanol, so that the polymer is precipitated in a granular and easily filterable form. The 'methanol-soluble' material can be recovered by filtering off the polymer and evaporating the filtrate to dryness. Using this procedure as a method of analysis, it has been shown that the low-molecular weight compounds are formed from the linear polymer, and that the amount formed is dependent upon the temperature to which the polymer is heated. A single experiment indicated that the reaction is reversible. The amount of 'methanol-soluble' material found varied from 1·9 per cent after heating at 275° C. to 4·3 per cent at 295–300° C. and 5·9 per cent at 310° C.

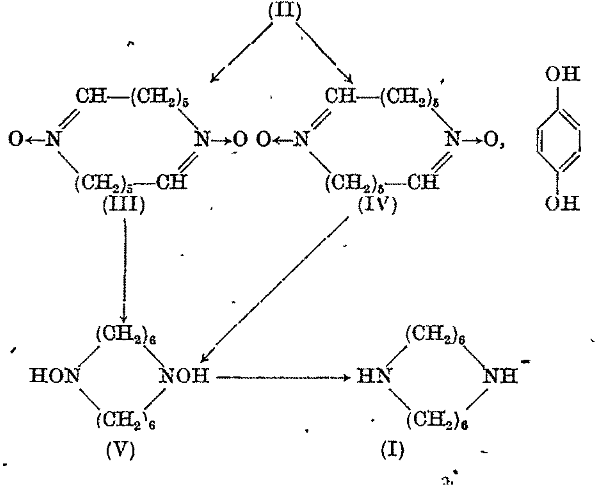
Synthesis of 1 : 8-Diazacyclo-tetradecane

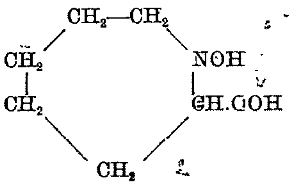
THE 14-membered-cyclic diamine (I) has been synthesized in these laboratories by three entirely independent routes. In two of these the large-ring diamides discussed in Dr. P. H. Hermans' communications were the starting materials. Both the nylon 6 : 6-cyclic monomer, kindly supplied by Dr. R. J. W. Reynolds, and the cyclic dimer from caprolactam, kindly supplied by Dr. Hermans, were reduced by lithium aluminium hydride in boiling tetrahydrofuran without difficulty. The identity of the reduction product from these two sources thus provides chemical proof of the cyclic systems, no other structures leading to a common product. The diamine is strongly basic, melting point 72°, boiling point 145°/12 mm., dipicrate melting point 248° C., dihydrochloride melting point 315–9° C.

The third route is less to be expected, and uses as starting material N-hydroxyhexamethyleneimine (II), boiling point 94–5°/13 mm., melting point 7° C., which has been prepared by two methods[1], and the structure assigned to it has been confirmed by analysis of the base, its hydrochloride, acid oxalate and picrate, and by its reduction to hexamethyleneimine. It behaves normally as a hydroxylamine in every respect save only the remarkable sensitivity of the free base to atmospheric oxygen. It is characteristic of N-dialkylhydroxylamines to autoxidize very rapidly in aqueous alkali[3], and very slow oxidation often takes place on keeping the free base in air. N-Hydroxyhexamethyleneimine is so sensitive to oxygen that all operations must be carried out in an atmosphere of nitrogen. Exposure to oxygen for a few minutes leads to cloudiness and for longer periods to the precipitation of a flocculent, amorphous, and no doubt polymeric, solid, which is insoluble in practically all solvents. Eventually (after some weeks) a film of the hydroxylamine exposed to air will set to a brittle solid.

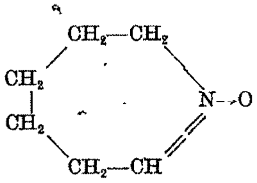
The phenomenon shows particularly clearly in ether solution, which soon becomes opaque and strongly peroxidic to starch iodide paper; and after a few hours, especially when oxygen is passed through the solution, deposits a film on the walls. It was observed that the deposit, though largely amorphous, contained traces of crystalline material, and this has been isolated in very low yield and found to be very labile, losing its solubility in organic solvents when heated to temperatures approaching 100° C. It was then found that much more crystalline material was formed when quinol in roughly half-molecular amounts was present during the oxidation, and that the product was much less heat-labile, though becoming insoluble in organic solvents at temperatures above 100° C. Analysis of this latter compound suggested an empirical formula $C_{18}H_{28}N_2O_2$, that is, a combination of quinol and a dimerized oxidation product of N-hydroxyhexamethyleneimine. To the two crystalline products have been assigned structures (III) and (IV). On hydrogenation of (IV) by Adams catalyst in methanol, four atoms of hydrogen are absorbed, and the products are free quinol and a new compound (V) with the properties of a hydroxylamine. Compound (III) can be reduced in the same way, and the X-ray powder patterns and infra-red absorption curves of the products are identical. Dr. C. J. Brown of these laboratories has examined crystals of (V) by X-ray diffraction and has deduced that a large ring (12-, 14- or 16-membered) is consistent with all the intensity results; but as yet the final electron-density map showing the position of the atoms has not been obtained.

Compound (V) has now been hydrogenated further with Raney nickel in glacial acetic acid to the cyclic diamine (I), this constituting the third synthesis.





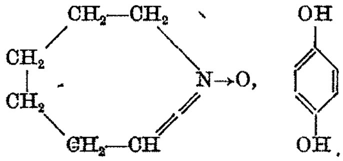
(VI)



(VII)

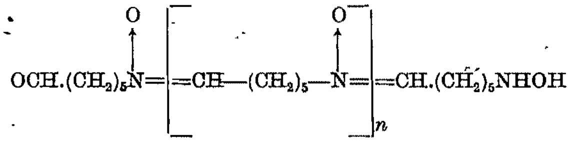
The structure assigned to (IV) leaves open the question of whether the quinol is bound to the nitrone by covalent or ionic bonds or as a molecular complex or clathrate system.

It is now possible to see how N-hydroxyhexamethyleneimine polymerizes during autoxidation, though no really convincing explanation of why it does so has yet been suggested. The first product is probably the hydroperoxide (VI), and indeed very labile, strongly peroxidic, solids have been detected, but isolation has not been possible. Hydrogen peroxide is eliminated from (VI), leaving the cyclic nitrone (VII), which can be shown to be unstable and to polymerize, for it can be made by a different route: N-hydroxyhexamethyleneimine reacts rapidly with quinone in ether with hydrogen transfer and formation of the complex (VIII), a crystalline solid, which, after a few hours, changes to a resinous polymeric material, insoluble in solvents, and quinol.



(VIII)

Again the question of the precise structure of the complex is reserved for further discussion. The polymer formed by autoxidation is thought to be of rather low molecular weight, and is represented:



$$\mathrm{OCH.(CH_2)_5\overset{O}{\overset{\uparrow}{N}}{=}}\left[\mathrm{{=}CH{-}(CH_2)_5{-}\overset{O}{\overset{\uparrow}{N}}{=}}\right]_n\mathrm{{=}CH.(CH_2)_5NHOH}$$

(IX)

In agreement with this, reduction by Raney nickel in glacial acetic acid gives polyamines, showing positive spot tests for both primary and secondary amines. The water formed during the oxidation, via hydrogen peroxide, is probably an effective chain stopper. The strong reducing properties, to triphenyltetrazolium chloride[1], suggest a high proportion of hydroxylamine groups.

Full details of this work will be submitted to the *Journal of the Chemical Society* for publication.

I acknowledge gratefully the help of Drs. E. J. Alford and J. A. Hall, and the crystallographic examination by Dr. C. J. Brown.

LETTERS TO THE EDITORS

The Editors do not hold themselves responsible for opinions expressed by their correspondents. No notice is taken of anonymous communications.

Filamentous Forms of Influenza Virus

There is good evidence that the filamentous forms characteristic of many recently isolated strains of influenza A are infective units[1]; but their significance in relation to the process of influenza virus replication is by no means clear. It has been suggested that filaments represent the initial form in which the infective phase of the virus is produced, spheres being formed secondarily[2]. Others have suggested that the filament is a by-product, as it were, of the process by which new infective particles are produced at the free surface of the allantoic cell[3].

Although it has been known since 1949[4] that the filaments are clearly visible by dark-ground illumination at a magnification of 500 or even less, very little use has been made of this method of observation. It has, however, a number of advantages over the conventional use of the electron microscope for such work. A simple, and for most purposes sufficiently accurate, method of comparing concentrations of filaments is as follows. A standard volume, 20 c.mm., is placed on a clean slide and covered carefully with a coverglass of standard size (⅞-in. circle). The preparation is put into a moist chamber for 15 min. or longer to allow the great majority of the filaments to attach themselves to one or other glass surface. Using a standard area of field with an 'Ehrlich' eyepiece and a 47 × objective, the number of filaments on the two glass surfaces plus the few seen in moving from one focal level to the other can be readily counted. To a reasonable approximation the number of filaments per field area X is equivalent to $X \times 10^7$ filaments per c.c., and with the highly filamentous strains Oc. Is., *PERS* and *RYAN*, X is of the same order as the hæmagglutinin titre. For convenient counting it is necessary to dilute the average infected fluid 1 : 10 or 1 : 20.

This method has been used in an exploratory series of investigations for finding agents capable of destroying the filaments as estimated by the reduction in the numbers of visible forms. The interesting result has emerged that most agents capable of hæmolysing red cells will destroy virus filaments and show a threshold at about the same level of concentration. Hypotonic salt solutions are destructive at concentrations of 0·3 per cent sodium chloride or lower. At or near threshold concentrations, distorted forms with angulation and a beaded appearance may be seen; at lower concentrations forms recognizable as filaments become extremely rare. Disintegration is more rapid and complete at *p*H 6 than at *p*H 8.

As representative hæmolytic agents saponin, cetyltrimethylammonium bromide and sodium lauryl sulphate were used. They were completely destructive at concentrations of 0·01 per cent, but had virtually no effect at a concentration of 0·001 per cent. The end point of hæmolysis of 1 per cent fowl cells also lay between these concentrations. Saponin was less active in the sense that few filaments were completely destroyed. Obvious evidence of damage was produced to a concentration of 0·003 per cent in the form of distortion, beading and, particularly around 0·01 per cent, very firm adsorption to glass surfaces. The damage was confirmed in electronmicrographs made for me by Dr. Heather Donald.

Shaking with ether or chloroform destroys the filaments. Using the normal procedure of shaking infective fluid with 20 per cent of freshly redistilled ether and leaving overnight in the refrigerator, virtually all filaments were destroyed. The hæmagglutinin titre showed a moderate fall when tested with fowl cells; but a rise with human or guinea pig cells. Untreated, the strain Oc. Is. gave fowl-to-human hæmagglutinin titres of 600/700, after treatment with ether 300/3,200. Of non-filamentous strains similarly treated, only *PR*8 showed a change of this type from 500/700 to 130/600. Infectivity titrations showed no reduction beyond 0·5 $\log_{10}$ when treatment was with redistilled ether on allantoic fluid buffered with phosphate at *p*H 7·0. The same lack of effect on infectivity was seen when filaments were broken down with water lightly buffered at *p*H 7·0 or 8·0.

The results suggest that the filaments have qualities resembling those of the host cell surface, and that their formation is a result of an interaction of virus components with the surface of the cell in which virus has multiplied. Failure to influence infectivity by filament destruction may mean that their infectivity is limited to the spherical units that often appear to be incorporated in the filaments.

Reactivation of Partially Degraded Tobacco Mosaic Virus

Recent infectivity studies with partially degraded tobacco mosaic virus have led to the inference that the virus particles can remain active after some of the protein has been experimentally removed so as to expose portions of the ribonucleic acid core[1,2]. In one of these studies[2] it was found that, upon heating the virus briefly with a detergent, the infectivity was reduced from that in the original sample by a factor of 4–10; most of the activity then remaining was found to reside in partially degraded virus particles, as judged by the fact that their infectivity could be greatly reduced by digestion with crystalline pancreatic ribonuclease.

While there is as yet no clear understanding of the separate roles of virus protein and ribonucleic acid in the process of infection, it appears that the structural integrity of the ribonucleic acid is essential for activity[2], whereas the protein coat need not be intact. It may then be asked whether the mere removal of part of the protein has any direct effect on infectivity. Such an effect is not necessarily indicated by the partial inactivation occurring in the heat-detergent treatment, since the treatment may disrupt the ribonucleic acid as well as the protein in some of the particles. In order to determine whether part of the heat-detergent inactivation might be directly due to the removal of protein, an attempt has been made to reverse this inactivation by replacing the protein removed in the treatment. That a replacement of protein might be possible was suggested by the work of Fraenkel-Conrat and Williams[3], who showed that the purified protein and

Table 1. EFFECT OF TREATMENT UPON INFECTIVITY OF TOBACCO MOSAIC VIRUS
(Ratio of infectivity of treated to untreated material)

Treatment	Exp. 1	Exp 2	Exp. 3
Heat-detergent treatment	0·06	0·04	0·044 ± 0·004
Heat-detergent treatment followed by reactivation treatment	0·3	0·5	0·29 ± 0·05

ribonucleic acid components of tobacco mosaic virus can be combined *in vitro* to form active virus particles.

The heat-detergent treatment was like that described previously[2], except that the heating period was changed from 6 sec. to 10 sec. In material treated for the longer period, it was found that about 15 per cent of the total ribonucleic acid was so exposed as to be digestible with ribonuclease (in contrast with a possible exposure of less than 5 per cent following the shorter treatment). About 5 per cent of the original infectivity remained, and most of this could be destroyed by ribonuclease digestion.

In the reactivation treatment, a solution containing about 0·01 mgm./ml. heat-detergent treated tobacco mosaic virus and 1 mgm./ml. purified protein of tobacco mosaic virus (prepared by Dr. H. Fraenkel-Conrat[3]) was made 0·01 *M* in acetate by the addition of 3 *M* acetate at *p*H 6. The mixture was then allowed to stand at room temperature for a period of 4–24 hr. before final dilution and assay[2].

Table 1 lists the results of three separate reactivation experiments performed with the same initial preparations of the purified virus and virus protein. The uncertainties of measurement (corresponding roughly to 95 per cent confidence limits) are indicated only for the third experiment, which differed from the others in that the dilutions of the inocula compared had been so adjusted that they produced approximately the same numbers of local lesions on the test plants. In the assays where lesion numbers were not well matched, it was necessary to assume proportionality between lesion number and infectivity over wide ranges in order to estimate the infectivity ratios. Since the accuracy of this assumption is questionable, it would be misleading to give estimates of uncertainty based only on the variations in the results of those assays. A number of additional reactivation experiments were done with different starting preparations of the virus and virus protein While the results were not always in close quantitative agreement with those given here, all were qualitatively consistent in indicating a rise in the infectivity of heat-detergent treated tobacco mosaic virus upon standing in the presence of the purified protein.

The explanation offered for the above results is that the reactivation treatment does replace some or all of the protein removed from the particles in the heat-detergent treatment. A direct demonstration of this reaction by chemical methods was considered impractical because of the relatively small amount of protein which would be involved; however, a number of biological tests have been made in order to check the hypothesis. These tests are described below.

(1) The purified protein alone was found to be non-infectious. and it could not be 'reactivated' by treatment with acetate alone. (Similar results have been previously reported[3].)

(2) The heat-detergent treated virus did not increase in infectivity upon standing in water or in acetate solution alone.

(3) When the heat-detergent treated virus, protein and acetate were mixed at the time of final dilution (that is, immediately before assay) little or no reactivation took place.

(4) The reactivation treatment had little or no effect on the infectivity of intact tobacco mosaic virus.

(5) The heat-detergent treated tobacco mosaic virus could not be reactivated after exposure to ribonuclease. Also, when ribonuclease, protein of tobacco mosaic virus, and acetate were added simultaneously to heat-detergent treated virus, and the mixture allowed to stand, the infectivity was then reduced from that in the initial heat-detergent treated sample. When the addition of the ribonuclease for such a mixture was postponed until 24 hr. after the addition of the protein and acetate, the reactivated sample then showed little or no reduction of infectivity upon standing with the enzyme.

The last result indicates that after the reactivation treatment the ribonucleic acid is no longer exposed to ribonuclease digestion; thus it appears that protein has indeed been added to the particles. However, even though the ribonucleic acid is apparently 'covered', less than half the original infectivity is restored. The experimental results described here do not indicate whether the final deficit from the starting infectivity is due to chemical changes in the ribonucleic acid or to defects in the protein coat (other than 'gaps' large enough to permit attack by ribonuclease). The results do indicate that about one-fourth (and perhaps more) of the inactivation of tobacco mosaic virus in the heat-detergent treatment may be accounted for by the removal of part of its protein.

I am grateful for the advice and assistance of Drs. Robley C. Williams, Heinz Fraenkel-Conrat and C. Arthur Knight.

Multiplicity Reactivation of Bacteriophage

Luria and Dulbecco[1] formulated the most simple theory that could account for multiplicity reactivation. They supposed that each bacteriophage particle contains a certain fixed number of genetic units; if one or more of these units is damaged by irradiation, the particle will not multiply unless it shares a bacterium with other particles which can supply undamaged versions of the units needed to make a complete set. Therefore the probability that a multiple-infected bacterium (multicomplex) contains a complete set of undamaged units should be simply a function of the number of units in a particle, the proportion of units which have been damaged by irradiation, the number of particles per bacterium (multiplicity), and the distribution of particles among bacteria. Early experiments showed that, within certain limits, this probability (termed 'the survival of multicomplexes') behaved in the expected way when multiplicity and degree of irradiation were varied.

Later, Dulbecco[2] subjected the theory to a stricter test in the range where prolonged irradiation of the particles makes subsequent multiplicity reactivation a very rare event. According to the proposed theory, as the time of irradiation is increased the slope of the curve of survival of multicomplexes against time of irradiation should approach the slope of the curve of survival of single particles. In fact, the decline in survival of multicomplexes was shown to occur much less rapidly. Since no simple process of unit substitution could be more efficient than the proposed one, the recombination theory of multiplicity reactivation was therefore regarded as disproved.

Variation in bacterial size would produce exactly this effect. In an extreme case, the decline in survival of multicomplexes with increasing irradiation would merely represent decline in the number of cells large enough to have collected enough particles to ensure the presence of one complete set of undamaged units. We have therefore recalculated expectations for Dulbecco's experiments, incorporating the frequency distribution of cell-sizes given by Dulbecco in an appendix to the earlier paper. We have assumed that there is a Poisson distribution of bacteriophage particles over the bacterial surfaces, that the bacterial lengths given by Dulbecco can be equated with surface areas, and that there is no loss through lysis-from-without. We have also had to assume that a frequency distribution of cell-sizes, based upon measurement of 764 cells, is adequate for predicting events which have a frequency of 10^{-4} to 10^{-7}.

As shown in Fig. 1, the agreement between observation and recalculated expectation is surprisingly good, considering the uncertainties of the calculation. The observed survival of multicomplexes is now seen to be close to, or rather lower than, expected. Therefore, it seems no longer necessary to seek an alternative to the recombination theory of multiplicity reactivation.

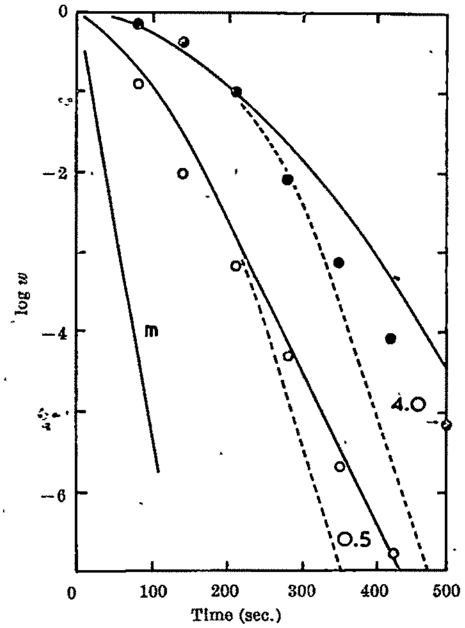

Fig. 1 Effect of increasing irradiation on the survival of multicomplexes. The proportion of surviving multicomplexes (*w*) is plotted against the time of irradiation for the two multiplicities, 0·5 and 4·0 bacteriophage particles per bacterium. Broken lines represent the expected survival as calculated by Dulbecco, assuming a Poisson distribution of particles among bacteria; solid lines are for the recalculated distribution, assuming a Poisson distribution of particles over the bacterial surfaces. Each particle was taken to contain 25 units. The points and the curve for survival of single particles (*m*) are from Dulbecco's paper

Composition of a Hypertensin Peptide

The isolation of a homogeneous pressor peptide (hypertensin or angiotonin) made by the action of rabbit renin on ox serum was previously reported by me[1]. Further quantitative study on the composition of this pressor peptide has shown the empirical structure to be:

One residue: leucine, phenyl alanine, tyrosine, proline, aspartic acid and arginine.

Two residues: valine and histidine.

This gives a minimum molecular weight of 1,445. The distinction between aspartic acid and asparagine has not yet been made.

Only one N-terminal amino-acid, aspartic, was found, using the dinitrofluorobenzene technique[2], and this was supporting evidence of homogeneity.

The hypertensin peptide recently described by Skeggs, Marsh, Kahn and Shumway[3] differed only by the presence of *iso*leucine in place of one of the two valine residues. This would presumably represent a species difference, since these workers used pig renin and horse serum substrate. The N-terminal amino-acid was not stated, and no further comparison is possible.

Effect of Antibody on the Respiratory Rate of *Trypanosoma vivax*

The West African N'Dama breed of cattle shows a remarkable tolerance to trypanosomiasis, as was demonstrated by Chandler[1]. In order to investigate the nature of this tolerance, it was necessary to develop a technique which would give a quantitative estimation of antibody titre. Methods employed in the study of bacteriological immunity are not generally applicable to the study of the immune response as it occurs in African trypanosomiases. Tests such as the mouse protection test employed by Fiennes[2] in studying *T. congolense* infections do not readily give a quantitative estimate of antibody titre and are operative only when the trypanosomes survive in the host as a patent or latent infection.

It was noted that the oxygen consumption of two strains of *T. vivax*, one cyclically transmitted and maintained in sheep and the other adapted to rats and passaged by syringe, showed a marked decrease

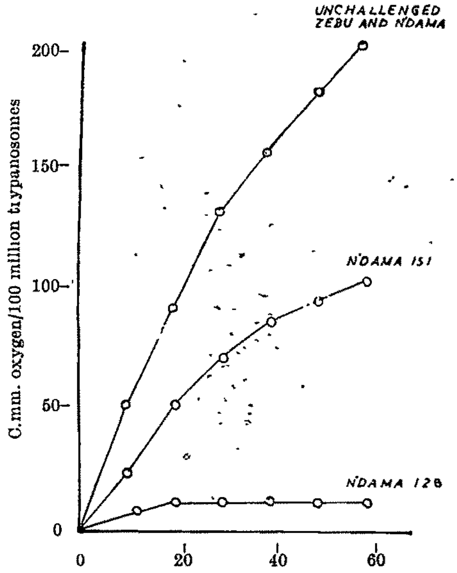

Fig. 1. Effect of N'Dama 128 serum one week after challenge, and N'Dama 151 serum 42 months after challenge, on the oxygen consumption of the rat strain of *T. vivax*

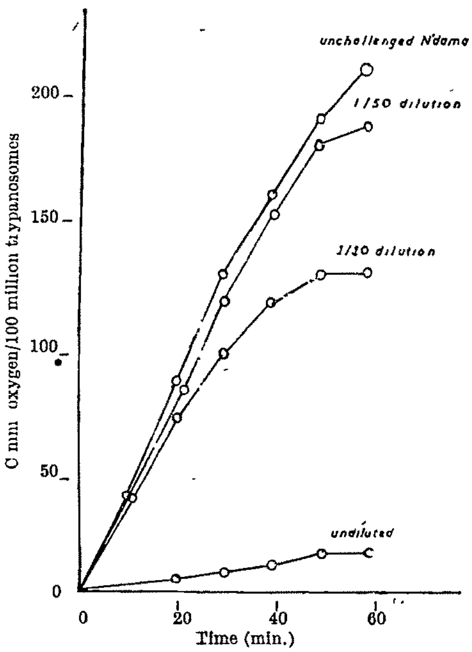

Fig. 2. Oxygen consumption of the rat strain of *T. vivax* suspended in unchallenged N'Dama sera and in various dilutions of N'Dama 128 serum

when suspended in sera of N'Dama cattle previously challenged with this species of trypanosome. It was afterwards found that the rat strain, adapted to this host by a method described by Desowitz and Watson[3], was considerably more sensitive to the action of the sera than the sheep strain. The reduction in oxygen consumption appears to be caused by a species-specific antibody in the N'Dama serum as indicated by accompanying trypanolysis. Furthermore, the degree of inhibition of oxygen consumption seems to be related to the titre of antibody present, since the degree decreases as the period after challenge increases (see Fig. 1). No inhibitory effect occurs with sera from unchallenged Zebu or N'Dama cattle, indicating the absence of any 'natural' antibody possessed by the N'Dama breed.

N'Dama 128 was challenged with the sheep strain of *T. vivax*. A few parasites appeared in the blood three days following challenge, after which no trypanosomes were seen. One week after challenge serum was obtained and was found to effect an almost total suppression of oxygen consumption of the rat strain. Lysis of all trypanosomes was noted after an experimental run of 1 hr. The effect on the respiration-rate of the rat strain of *T. vivax* of various dilutions of N'Dama 128 serum with unchallenged N'Dama serum is shown in Fig. 2.

In December 1952, N'Dama 151 was challenged with a strain of *T. vivax* that had been maintained in Zebu cattle; a low-grade intermittent parasitæmia persisted until August 1953, after which time no parasites were detected in the blood. In June 1955, serum from this animal was found to suppress partially the oxygen consumption of the rat strain of *T. vivax*, indicating that antibody in N'Dama serum may persist for some two years.

All trials were carried out in conventional Warburg respirometers for 1 hr. at 36·5° C.; 2 ml. sera were placed in 20-ml. flasks and trypanosomes added to give a suspension of 30–60 million trypanosomes per cm.[3]. The method is believed to be rapid and simple in giving a quantitative estimation of antibody titre in the immune response to trypanosomiasis. Full details of the comparative immune response of Zebu and N'Dama breeds will be published elsewhere.

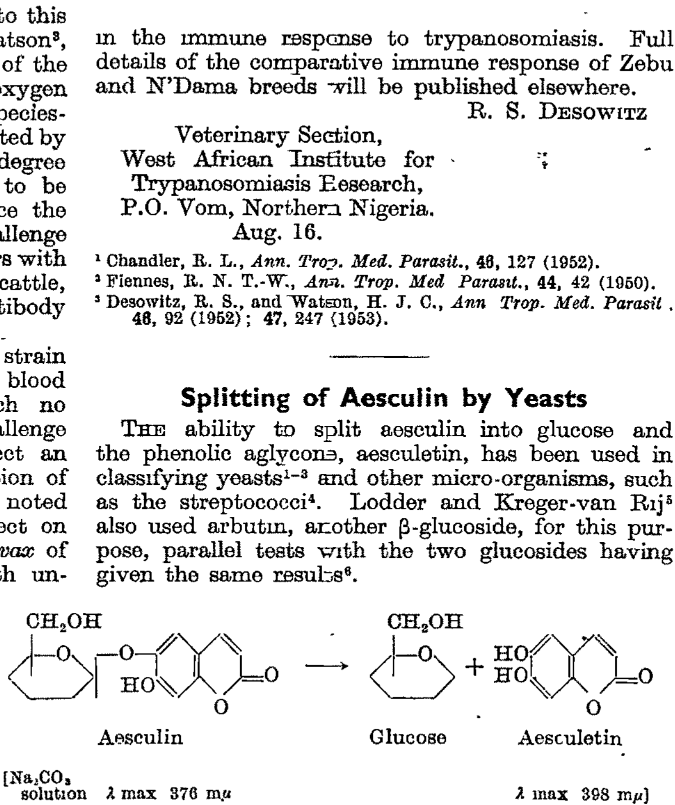
Splitting of Aesculin by Yeasts

The ability to split aesculin into glucose and the phenolic aglycone, aesculetin, has been used in classifying yeasts[1–3] and other micro-organisms, such as the streptococci[4]. Lodder and Kreger-van Rij[5] also used arbutin, another β-glucoside, for this purpose, parallel tests with the two glucosides having given the same results[6].



We find that all yeasts we have tested are capable of splitting aesculin under appropriate conditions of nutrition. Our survey included 115 different strains (Table 1), mainly obtained from the chief national culture collections. Ninety-one of these strains are listed as species which are said not to split arbutin[5] and therefore, *a priori*, were not expected to hydrolyse aesculin[3,6].

Table 1. TYPES OF YEAST USED

Classification (refs. 3, 5)	Number of strains
Saccharomycetaceae	
Saccharomyceteae	
Saccharomyces	87*
Pichia	5
Hansenula	5
Debaryomyces	1
Cryptococcaceae	
Cryptococcoideae	
Cryptococcus	1
Torulopsis	1
Candida	5
Kloeckera	6
Rhodotoruloideae	
Rhodotorula	3
Sporobolomycetaceae	
Sporobolomyces	1

* Includes 11 strains of *Saccharomyces cerevisiae*

The techniques we used differ from those of previous workers[1,2,5], both for growing the yeast cells and for assessing the splitting activity. The yeasts were grown on malt–yeast–glucose–peptone agar[8] in Roux bottles at 25° C. for three days. The growth was washed off the agar surface with 10 ml. of a synthetic medium (*A*2), containing trace elements, vitamins, salts, ammonium sulphate, but no source of carbon[9]. 2 ml. of this suspension was pipetted into a *T*-tube[9] and another 2 ml. of the same medium, containing 0·05 per cent aesculin sterilized by Seitz-filtration, added.

The tubes were shaken[9] for 20 hr., the yeast suspension centrifuged, and the supernatant liquid extracted with ethyl acetate (5 ml.). 3 ml. of the upper layer was shaken with 1·5 *M* sodium carbonate solution (5 ml.) in a separating funnel. The yellow colour in the aqueous phase was due to aesculetin, as shown by its characteristic ultra-violet absorption spectrum ($\lambda_{max.}$ 398 mμ), and in every case contrasted markedly with that of the control. The colour change was measured with a spectrophotometer.

Results were quite different when the yeasts were grown on the *A*2 synthetic medium[9] to which 1 per cent glucose and 2 per cent agar had been added. After growth on this medium, which is less rich than the malt–yeast–glucose–peptone agar, only about half the strains split aesculin measurably. For example, the following seven strains split about 50 per cent or more of the aesculin in 20 hr. when grown on the complex medium, but less than 5 per cent if cultured on the synthetic medium: in each case the cell suspension introduced from the synthetic medium into the aesculin medium was of the same order of size as that from the complex malt–yeast–glucose–peptone agar medium:

Pichia membranaefaciens (CBS 10)
Saccharomyces acidifaciens (CBS 26)
Saccharomyces bisporus (NCYC 171)
Saccharomyces carlsbergensis (NCYC 324)
Saccharomyces cerevisiae (NCYC 176)
Saccharomyces fermentati (CBS 13)
Saccharomyces rouxii (CBS 24)

(NCYC: National Collection of Yeast Cultures.
CBS: Centraalbureau voor Schimmelcultures; the CBS number in each case refers to the Zygosaccharomyces strain in the 1950 catalogue.)

We conclude that the ability to split aesculin is far more widespread among yeasts than has been suspected hitherto. This fact may have been unnoticed so far because (*a*) the yeasts have been grown on nutritionally poor media; (*b*) much smaller inocula have been used; and (*c*) the methods for detecting aesculetin have been relatively insensitive. There has been no mention previously of any one α- or β-glycoside, including disaccharides, which is split by so many kinds of yeast.

We intend to publish a full account of this work later. It was carried out as part of the programme of the Food Investigation Organization of the Department of Scientific and Industrial Research.

A Dielectric Study of the Low-Conductance Surface Membrane in *E. coli*

DIELECTRIC studies have shown that the low electric conductivity of many biological cells originates in an extremely thin layer—apparently of the order of 30 A. thick—located somewhere in the cell envelope, presumably in the cytoplasmic surface structure[1]. This insulating structure is called here the 'low-conductance surface membrane'.

Although it has been repeatedly shown[2] that the conductivity of bacteria is well below that of the suspending medium, it is not yet known whether the conductivity lies in the range of very low values found in other types of cells. Neither is it known whether the control of the conductivity lies in the cell envelope. In order to throw light on these questions, we have examined suspensions of *E. coli* (*B*), taken from a 20-hr. culture in aerated nutrient broth ('Difco') at 37° C.

To obtain significant information on the conductivity of the bacterial cell, it is necessary to work with very dense suspensions. This was done by centrifuging the bacteria into a plastic conductivity cell mounted on a fast centrifuge. Similar observations at lower speeds were reported many years ago by Shearer[2a]. To enable us to take into account[1a] the conductance of the residual medium, its volume was determined by suspending the bacteria in dilute hæmoglobin and measuring the amount of the protein left between the packed cells. The method is still under development; but it is clear that the conductivity of the bacterial cell is quite low, the upper limit set by the present observations (taken at 50 kc./s.) being 10 per cent of that of the suspending sodium chloride or sodium plus calcium chloride medium. (In contrast to Shearer[2a], we found *E. coli* to be quite stable in pure sodium chloride (without calcium), both in terms of conductivity and viability.)

To determine the cause of the low conductivity of the bacteria, their conductivity and dielectric constant were measured over a frequency-range of 50 c./s., to 150 × 10^6 c./s., using three different bridges and conductivity cells[1a,1b,3a,3b]. The effect of

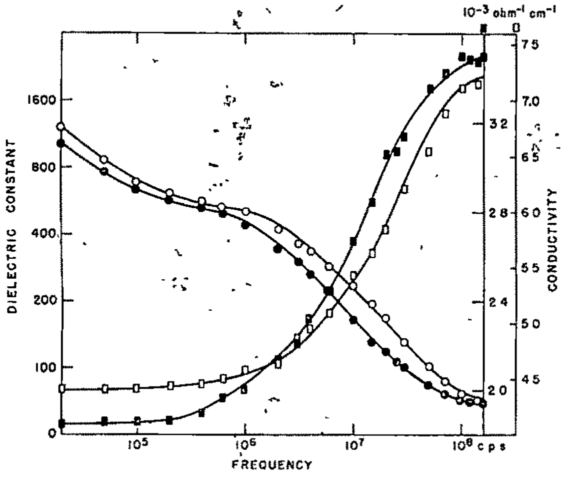

Fig. 1. Dielectric constant (circles) and conductivity (squares) of *E. coli B* in 0·25 per cent sodium chloride (solid symbols) and 0·50 per cent sodium chloride (open symbols). 5 × 10^{11} cells/ml.

electrode polarization in the low-frequency region was eliminated by means of the 'movable electrode' method[1b,4].

The bacterial spectra (Fig. 1) resemble those found in other cells[1]. The strong low-frequency band (only partly shown in the figure) complicates the analysis somewhat. Similar bands have been found in other types of cells[1b,5], but their meaning is still obscure[1b,4a]. The presence of the low-conductance surface membrane is indicated by the high dielectric constant of the cells in the frequency-region above this band, and by the band in the high-frequency region. This band represents the effect of the resistance of those elements of the cell and of the surrounding medium, which electrically are in series with the membrane[1a]. This interpretation is supported by a quantitative analysis of the spectra. This analysis, which is a generalization of one described earlier[6], was applied to a series of experiments with different salt concentrations in the suspending medium (0·07–0·6 per cent sodium chloride). This variable controls the resistance of the elements in series with the membrane and hence the spectral position of the band, which showed the theoretically expected shift toward higher frequencies with increasing salt concentration (Fig. 1). A significant point in this analysis is the great width of the high-frequency band, compared with the Debye form, which is explained by the oblong form and heterogeneity in size of the bacteria.

The analysis leads to the conclusion that the dielectric constant of the membrane becomes constant above 1 or 2 Mc./s. The capacity of the membrane in this frequency-region was calculated as that of a perfect insulator in the manner described before[7]. For this purpose, the membrane was assumed to be located at the geometrical surface of the bacterium, as observed microscopically on wet unstained material. The possible presence of cells with transverse membranes was ignored. The value calculated was 0·7 μF., in satisfactory agreement with values of 0·8–0·9 μF. obtained for other cell species (erythrocyte, leucocyte and yeast) in which it was found possible to establish a constant value of the dielectric constant of the membrane in the high-frequency region[8]. The corresponding value for the ratio of the thickness to the dielectric constant of the bacterial membrane is t_m/ε_m = 13 A., against earlier values[8] of 10–11 A.

We conclude that the *E. coli* organism possesses a low-conductance surface membrane of approximately the same thickness and dielectric constant as those found in the cell species studied previously. The estimate of 30 A. given above for the thickness of the membrane was based on the assumption that its dielectric constant in the high-frequency region studied is not much above its optical value, which may be taken to be 2·3 (corresponding to a refractive index of 1·5).

Kinetics of Photosynthesis and Photo-inhibition

THE use of our recording micro-volumeter[1] with reaction vessels of 10 μl. volume or larger and irradiated area 5 mm.[2] or more allowed the concentration of quite high light intensities on samples of *Chlorella* cells, the rate of oxygen exchange of which was measured. Kinetic studies were made of the limiting photosynthetic reactions and of the inhibitory effects caused by strong light ('solarization'). Experiments with flashing light of mainly two types were carried out: variation of dark-time (t_d, 10^{-3} – 1 sec.) with a constant time of flash (t_f, 10^{-4} sec. or higher) and variation of time of flash (10^{-4} sec.–1 sec.) with a constant dark-time (5×10^{-2} – 1 sec.). In all cases a sufficiently high light intensity[1] was applied to ensure saturation. We were able to corroborate most of the earlier observations made in this field—which often were apparently inconsistent—and combine the result in a common scheme. A more detailed account of the literature will be given elsewhere.

If very short flashes are alternated with dark periods of increasing length, the yield per flash increases linearly with dark-time during the first few milliseconds. The rate thus observed equals the saturation-rate in continuous light; that is, photosynthesis continues for a while at full rate after removal of the light and the dark reactions act on a substrate of long life formed in the flash.

If the dark-time is further extended, the yield per flash rises more slowly and ultimately approaches a final value. This maximum yield per flash (for $t_f \rightarrow 0$, $t_d \rightarrow \infty$ and $I \rightarrow \infty$) is independent of temperature and has the value observed by Emerson and Arnold[2]. As was first shown by Kohn[3], the relation between yield per flash and intensity (for $t_f \rightarrow 0$, $t_d \rightarrow \infty$) is of exponential (first-order) character.

From this we considered that in a brief flash a stable intermediate is produced photochemically in a 'one-quantum' process. In a single flash one light quantum can be stabilized per 150–400 chlorophyll molecules, assuming that 10 quanta are required per oxygen molecule.

If the time of flash is systematically increased (for $t_d \rightarrow \infty$), the (saturation) yield per flash initially increases strongly above the value observed with the shortest available flash, and the higher the temperature the faster the increase. Ultimately, the yield per flash increases proportionately with time, and this increase corresponds to the photosynthetic saturation-rate, as observed in continuous light at the prevailing temperature; that is, photosynthesis attains its steady-state rate only after the flash has lasted a definite time.

From this we conclude that in 'long' flashes an additional intermediate between light and oxygen is formed in a dark process. This can be regarded as the charging of an enzyme system. In several cases the time-courses observed in both types of flashing-light experiment can be quantitatively described by a reaction sequence, formally similar to that proposed by Briggs[4]:

$$U \xrightarrow{k_1 I} U^* \qquad (1)$$

$$E + U^* \xrightarrow{k_2 U_0} E^* + U \qquad (2)$$

$$E^* \xrightarrow{k_3} E + \varphi\,(O_2) \qquad (3)$$

U represents a complex of 150–400 chlorophyll molecules arranged around a final acceptor to which an absorbed light quantum is conducted. Excitation of this complex by a light quantum yields a stable product (U^*), which is insensitive to light unless restored in reaction (2). Reaction (3) in turn limits the regeneration of E and is in most types of algae the slower step. The concentration of enzyme E ($E_0 = E + E^*$) is of the same order of magnitude as that of the primary product of photolysis ($U_0 = U + U^*$), k_3 = 50–100 sec.$^{-1}$, k_2U_0 = 200–600 sec.$^{-1}$ (at 30° C.).

The above reaction mechanism also describes quantitatively the intensity vs. rate curves as observed in continuous light. A variation of the relative concentrations (E_0/U_0) and time constants (k_3/k_2U_0) involved may account for the variation of the saturation-rate and of the shape of light curves observed in differently pretreated algae.

Additional evidence for the arrangement of pigment molecules in functional units, which are as such involved in the (rate-limiting) photosynthetic dark reactions, was obtained from kinetic studies of photo-inhibition. In very strong light the quantum yield of photosynthesis (φ) decays with a first-order time course, scarcely affected by temperature. This indicates a photochemical inactivation of the pigment system. As soon as the quantum yield is decreased to about half its original value (in some algae even earlier), the saturation-rate in continuous light (R_m) also starts to drop. The time course and the dependence of the decay of both magnitudes on intensity and wave-length are very similar and could in some cases be quantitatively correlated.

We conclude that only one primary solarization reaction occurs, namely, the inactivation of complete pigment complexes. Such a decrease of U_0 will not only lower the quantum yield—since light absorption becomes ineffective—but also the saturation-rate, and this relatively faster the larger the ratio k_3/k_2U_0 in the algae studied. It can be shown from (1)–(3) that the saturation-rate corresponds to:

$$R_m = \frac{k_3E_0}{1 + k_3/k_2U_0}.$$

Photo-inhibition thus resembles the effect of poisons with so-called narcotic action. Conversely, it will be clear that, following the above picture, all poisons which attack U in preference to E will have 'narcotic' effect. This explains simply the narcotic type of action on photosynthesis which was observed with several 'catalyst poisons'. This suggests that acceptor U contains a heavy-metal system.

The influence of the light intensity on the process of photo-inhibition was further analysed. It appears that in general the half-times of decay are inversely proportional to the square of the applied intensity. From this it follows that the coincidence of two light quanta within a brief time interval may be responsible for the inactivation of a pigment complex. The results show that excited units (U^*) are less susceptible to photochemical destruction than non-excited ones (U).

Details of this work will be published elsewhere in greater detail.

Molecular Weight of Algal Chloroplastin

No recent experimental results are available for the molecular weight of chloroplastin. The available data for chloroplastin have been obtained from leaf extracts (spinach and aspidistra) prepared in a manner similar to that of Smith[1] and calculated from the ultracentrifuge data. Smith[1] and Smith and Pickels[2] found values of the order of 265,000 for chloroplastin; this high estimate is in part due to the contribution of the digitonin micelle. More recently, Takashima[3] made a leaf extract, crystallized a chlorophyll–lipoprotein complex in the cold from α-picolene and determined its molecular weight from diffusion studies to be 19,200. He postulated a complex of two molecules of chlorophyll per molecule of lipoprotein.

Chloroplastin, in the present communication, was prepared from cultures of two algal flagellates,

Table 1. CHLOROPLASTIN (*Euglena gracilis*)

	'Digitonin' extract			'Nacconal' extract		
	(1)	(2)	(3)	(1)	(2)	(3)
w mgm./ml.	29·0	27·3	29·6	44·3	42·5	23·0
w' mgm./ml.	0·37	0·36	0·35	3·1	3·8	0·67
p moles/litre (calculated from equat. 1)	10×10^{-5}	$9·4 \times 10^{-5}$	$10·2 \times 10^{-5}$	$6·4 \times 10^{-4}$	$6·1 \times 10^{-4}$	$3·6 \times 10^{-4}$
p' moles/litre (experimental)	$4·2 \times 10^{-5}$	$6·3 \times 10^{-5}$	$7·7 \times 10^{-5}$	9×10^{-4}	9×10^{-4}	$0·9 \times 10^{-4}$
M^1 gm./mole (ultracentrifuge)	290,000	290,000	290,000	69,400	69,400	69,400
M calculated (from M^1)	43,500	43,500	43,500	10,400	10,400	10,400
M calculated (from nitrogen)	59,000	38,000	30,000	23,000	28,000	50,000

(*Euglena gracilis* and *Poteriochromonas stipitata*). The organisms were concentrated by centrifugation and the centrifuged pellets were ground with sand and 0·9 per cent saline in the cold and recentrifuged twice at 3,000 r.p.m. Each time the pelleted material was discarded. The green supernatant fluid was dried under vacuum. This dried supernatant was extracted either with 2 per cent aqueous digitonin ('Digitonin', $C_{55}H_{90}O_{20}$, non-ionic detergent, *D*-58, Fisher Chemical Co.) or 'Nacconal *NRSF*' (anionic organic detergent–alkyl sulphonate, National Aniline Division, Allied Chemical and Dye Corp.), and these extracts (chloroplastin) were diluted to 1·8 per cent with buffer to *p*H's between 8·0 and 9·2. The pigment concentration, the sedimentation constant, the nitrogen, and the dry weight of the chloroplastin–detergent extracts were determined on freshly prepared material.

The molecular weight of algal chloroplastin was determined by two independent methods. The first was based on the analytical results for the extracted chloroplastin and the second on the geometrical form of the chloroplast, from microscopy.

The molecular weights of the macromolecules may be measured directly by extracting the pigment–macromolecule complex from the chloroplasts by nitrogen-free detergents, 'Digitonin' and 'Nacconal'. The contribution of the macromolecules to the weight of the extracted product may be established by determining the amount of nitrogen in the extract and by employing the assumption that the nitrogen comprised 15 per cent of the protein molecule. If, in addition, it is assumed that each macromolecule is associated with a single pigment molecule, a determination of the pigment concentration permits calculation of the molecular weight of the macromolecule. Alternatively, the molecular weight of the pigment–macromolecule–detergent complex may be determined by analytical ultracentrifugation. From the nitrogen determination, the molecular weight of the pigment–macromolecule may then be calculated directly. The determination of the weight of the complex by analytical ultracentrifugation and the determination of the percentage of nitrogen in the complex provide the best means of determining the molecular weight of the macromolecule.

From the extract, it was possible to obtain: (1) p', the chlorophyll concentration by optical absorption methods; (2) M^1, the molecular weight of the pigment–macromolecule–detergent complex by analytical ultracentrifugation; (3) w, the dried weight of the extract from which the pigment–macromolecule weight could be obtained by subtracting the known contribution of the detergent; and finally (4) w', the nitrogen content of the dried extract. From the analytical data (Table 1) it is also possible to show that one pigment molecule is associated with each macromolecule (lipoprotein; this term is used in preference to lipid layer since it includes the lipids and other macromolecular material as shown by their affinity for osmium tetroxide used in fixation). This is done by demonstrating that the experimentally determined concentration of chlorophyll p' is substantially the same as p calculated from the formula

$$p = \frac{w}{M^1} = \frac{\text{weight of dried residue}}{\text{molecular weight of complex from ultracentrifuge}} \qquad (1)$$

The molecular weight M itself is obtained from the assumption that all the nitrogen is in the lipoprotein molecule and that approximately 15 per cent of the lipoprotein weight is nitrogen.

Studies by electron microscopy of the chloroplasts in fixed algal flagellates[4] and isolated chloroplasts from a variety of plant material[5] have shown that the chloroplasts are composed of lamellæ (disks or plates). The electron micrographs of the chloroplasts permit a determination of the number and the dimensions of these layers.

Using the geometrical data from the electron micrographs of the algal chloroplasts, a knowledge of the chlorophyll concentration, and the assumption that the pigment molecules are arranged in monolayers, an estimation of the molecular weight of the pigment–macromolecule (Table 2)[6] can now be made from:

$$M = \frac{\pi D^2 T s L n}{4N} \qquad (2)$$

where D is the diameter of the photoreceptor, T is the average thickness of the dense (lipoprotein) layer, s is the density of a protein, L is Avogadro's number, N is the pigment concentration expressed in molecules per photoreceptor and n is the number of dense (lipoprotein) layers.

Table 2. STRUCTURAL DATA OF CHLOROPLAST AND CALCULATED MOLECULAR WEIGHTS

Chloroplast	D, chloroplast diameter (μ)	T, thickness of lipoprotein layers (A.)	n, No. of lipoprotein layers per photoreceptor	N, No. of pigment molecules	M, molecular weight chloroplastin
Euglena gracilis	8·27	242	21	$1·02 \times 10^9$	21,000
Poteriochromonas stipitata	4·15	390	10	$1·10 \times 10^8$	37,000

Molecular weights, *Euglena* chloroplastin, calculated from geometrical considerations alone, and from an independent analytical method, are in good agreement. The average value from twelve determinations in 'Digitonin' is 37,000, and from twelve determinations in 'Nacconal' is 29,000; whereas that from the geometry of the chloroplast is 21,000. For chloroplastin from another alga (*Poteriochromonas stipitata*) an average of 37,000 was obtained from the geometry of the chloroplast.

We have applied the same methods to the retinal rods of the frog and cattle eye[6] and obtained values of the order of 60,000 for frog rhodopsin and 40,000 for cattle rhodopsin, which are similar to recently determined experimental values[7].

Influence of Thyro-parathyroidectomy on the Hæmatological Changes induced by Cortisone in the Rat

The existence of a functional relationship between the adrenal cortex and the thyroid gland has been reported by many workers[1]. In the course of research into the underlying mechanisms responsible for this relationship, the effect of thyro-parathyroidectomy on the blood changes induced by injected cortisone, as indicated by modification of the leucocyte count[2], has been studied.

Twelve female albino rats of the Italico strain of about 250 gm. weight were used for the investigation. Six animals were adrenalectomized and used as controls: the remaining six were thyro-parathyroidectomized and four days later were adrenalectomized. The operations were performed under light ether anæsthesia. Two days later, the animals of each group received a single dose of cortisone acetate (Lepetit) subcutaneously, the dose being calculated on the basis of 2 mgm. per 100 gm. of body-weight. Blood was taken from the tail immediately before the injection of cortisone and thereafter at 3, 24, 48 and 72 hr. The blood films were stained with May–Grunwald–Giemsa's stain.

In the adrenalectomized controls the total leucocyte count showed a slight fall three hours after the cortisone injection, then rose to just above normal and remained at this level from 24 to 72 hr. The mononuclear count showed similar changes. On the other hand, the polymorphonuclear count rose sharply after three hours, then returned to about the normal level after 24 hr.

In the thyro-parathyroidectomized–adrenalectomized rats the total leucocyte count before the cortisone injection was about double that found in the adrenalectomized controls, the mononuclears being increased by about 10,000 and the polymorphonuclears by about 6,500. Three hours after the injection a fall in the total count was recorded and was more marked at 24 hr.; thereafter the total count returned to 'normal' at 48 and 72 hr. after the injection. The mononuclear and polymorphonuclear counts thus showed changes similar to those of the controls, but they were more marked and more prolonged.

The above results show that when adrenalectomy is combined with thyro-parathyroidectomy, the blood changes caused by the injection of cortisone are accentuated and prolonged.

Table 1. Leucocyte Counts in Six Adrenalectomized and Six Thyro-parathyroidectomized–Adrenalectomized Rats after Injection of Cortisone Acetate

No. of leucocytes (thousands per c.mm.)	Adrenalectomized controls					Thyro-parathyroidectomized–adrenalectomized animals				
	Before injection of cortisone	Hours after injection of cortisone				Before injection of cortisone	Hours after injection of cortisone			
		3	24	48	72		3	24	48	72
Total number of leucocytes	16	14	17	17	18	32·5	29	27	32	32
Mononuclear count	15	11*	16	15	17	25	15*	15*	21	22·5
Polymorphonuclear count	1·3	3·3*	1·4	1·2	1	8	14*	12*	11*	9·5*

Plasma Protein as a Precursor of Rat Liver and Hepatoma Protein

While there is little evidence that one protein can be converted into another without complete degradation to amino-acids in the tissues of normal animals (see Askonas *et al.*[1]), there is some evidence that such an interconversion of proteins can occur in tumour tissue. Thus Babson and Winnick[2] showed that the Walker rat-carcinoma incorporated amino-acids from injected plasma protein without complete hydrolysis of the latter to free amino-acids. Recently, Busch and Greene[3] have demonstrated a more rapid uptake of amino-acids derived from plasma protein by implanted tumour tissue than by normal tissue. In these experiments the uptake by the tissues of injected free amino-acids served as a control.

In order to determine whether this phenomenon is a characteristic of tumours, the incorporation of amino-acids derived from injected serum albumin into the proteins of liver and hepatoma has been studied in the rat.

A rat (340 gm.) was injected intraperitoneally with 50 μc. of L-^{14}C-lysine and killed after 6 hr The plasma was fractionated by the method of Campbell and Stone[4] to give a purified preparation of radioactive albumin. A rat (310 gm.) bearing several discrete hepatomas produced by feeding 4-dimethyl-aminoazobenzene was intravenously injected with 150 mgm of the ^{14}C-lysine-albumin (equivalent to 0·4 μc.) in 3 ml. of saline together with 20 μc. of L-^{14}C-alanine (1·0 mgm.). After 95 min., the rat was killed and the liver perfused with saline. The hepatoma tissue was separated from the unaffected lobes of the liver, and saline extracts containing the soluble proteins were prepared from the homogenized tissues.

After precipitation with trichloroacetic acid, the protein was hydrolysed with 5 N hydrochloric acid and the amino-acids were separated by ion-exchange chromatography (Hirs *et al.*[5]). The specific radioactivity of the lysine and alanine from each protein fraction was determined after conversion of the amino-acids to their dinitrophenyl derivatives. The ratio of the specific radioactivity of alanine to lysine from the hepatoma protein was 9·8 and from the liver 10·3.

Since the radioactive lysine in the tissue proteins was derived from plasma protein and the radioactive alanine from the pool of free amino-acids, these results suggest that amino-acids derived from injected serum albumin are not incorporated into the soluble proteins of hepatoma tissue to a greater extent than into those of liver tissue.

In order to make this a firm conclusion, two requirements remain : (*a*) that the size of the pools of alanine and lysine are approximately the same in the two tissues ; (*b*) that the presence of radioactive serum albumin in the tissue extracts does not materially alter the ratio of the radioactivity of alanine to lysine. Determination of the amounts of albumin in the extracts by precipitation with an antiserum for serum albumin[6,7] showed that, in fact, 8·4 per cent of the soluble protein from hepatoma, and 4·0 per cent of that from the liver, consisted of serum albumin. In view of this, experiments designed to provide more conclusive evidence on this point are proceeding.

This study will be extended to include tissues other than liver and hepatoma and plasma proteins other than albumin. We thank Prof. F. Dickens for his interest, and the British Empire Cancer Campaign for a grant to the Middlesex Hospital Medical School which covered the cost of the work.

Electrical Responses of Certain Lepidopterous Tympanal Organs

Although from a variety of behaviour work[1-3] there must be a strong presumption that the tympanal organs of certain night-flying moths respond to airborne sounds, hitherto no direct physiological evidence on this point has been forthcoming. We have recently been able to record electrical responses in the tympanal nerves of certain moths in response to stimulation by airborne sounds, and these preliminary experiments have revealed certain features of interest in the responses of the organs.

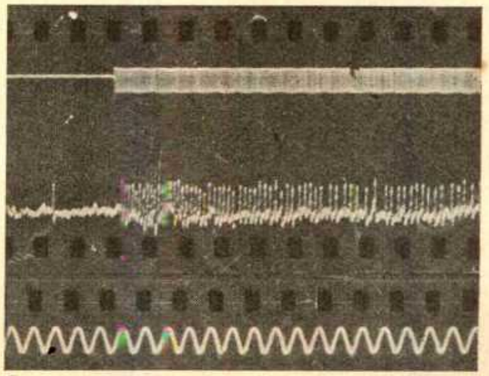

Fig. 1. Response in tympanic nerve of *Arctia* (middle trace) to pure tone stimulus of 3·5 kc./s. (upper trace). Timing wave, 50 c./s. (lower trace)

The insects used were the buff tip moth, *Phalera bucephala* L. (Notodontidae), and the garden tiger moth, *Arctia caja* L. (Arctiidae). The nerve preparations were made by clearing the mesoscutum of scales, cutting a window in the cuticle, dissecting away the overlying tissues to reveal the pterothoracic ganglion and tracing the compound nerve which serves some of the flight muscles and the tympanal organ. The branch serving the latter leaves the main trunk near the wall of the lateral air sacs ; it is thin and susceptible to desiccation, especially when severed from the main nerve, and therefore recording was done by placing two platinum wire electrodes on the nerve *in situ*. Since the nerve serving the tympanal organ is itself a mixed nerve, the records are marked in almost every case by large spikes derived from the motor fibres present.

Recording under conditions of zero stimulation showed that no resting discharge was present ; this is in contrast to other invertebrate hearing organs where, as Pumphrey[4] points out, all those so far investigated show this phenomenon. The moth tympanal organs responded to pure tone stimuli in the range 3–20 kc./s., the limit of the apparatus, and Fig. 1 shows the discharge in the tympanic nerve of *Arctia* to a stimulus of 3·5 kc./s. ; the response is asynchronous and shows no equilibration. Threshold measurements were not taken, but using the human ear as a standard the preparations were much more sensitive to high frequencies of the order of 16–20 kc./s. No apparatus for generating ultrasonic stimuli was available, but the preparations were very sensitive to the squeaks of a bottle top, which contain very high frequencies, and responded to such noises over a distance of 24 ft. Fig. 2 shows the responses in

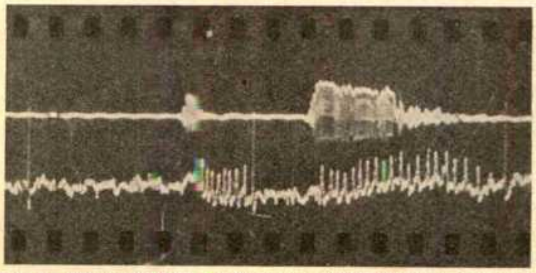

Fig. 2. Response in tympanic nerve of *Phalera* (lower trace) to pulses of high-frequency sound (upper trace). Note after-discharge and recurrent motor spikes in nerve record

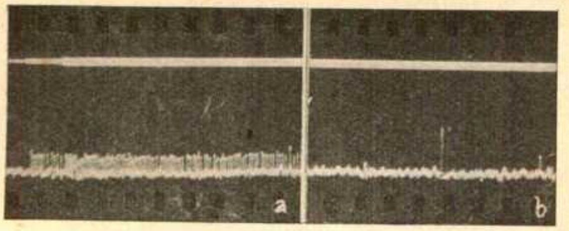

Fig. 3. Responses in tympanic nerve of *Arctia* (lower trace) to pure tone stimulus of 3 kc./s. (upper trace). (*a*) Onset of stimulus and nerve response; (*b*) the same record after 6 sec., showing only one motor spike

the tympanic nerve of *Phalera* obtained with such stimuli. It seems probable that the upper frequency limit of the tympanal organs is very high, extending well into the ultrasonic range, as in some Orthoptera.

One of the most interesting features of the responses of these organs was the adaptation shown to a constant stimulus, consisting of the reduction in frequency of the discharge from an initial high rate (Fig. 3*a*) to zero when the stimulus was maintained for 6 sec. or longer (Fig. 3*b*). That this was true adaptation and not fatigue was shown by the fact that a change in the intensity of the stimulus produced an increased discharge in the nerve. Such adaptation has not been found in any other invertebrate hearing organs so far investigated; it explains some of the observations of previous workers[3] that Noctuid moths remain unaffected by loud, continuous noises.

Response to high-frequency sounds of short duration also showed pronounced after-discharge (Fig. 2). The duration of the after-discharge was such as to make it probable that the appearance of volleys of spikes synchronous with the pulse or modulation frequency of the stimulating sound would only occur at modulation frequencies up to 45 c./s., a much lower figure than that obtaining in Orthoptera[5] or in Homoptera[6]. If the frequency of modulation exceeds this figure, the discharge first becomes continuous, and then ceases through adaptation, provided the stimulus continues long enough.

These preliminary findings suggest that the tympanal organ in these moths will respond to short pulses of high-frequency sound repeated at rates up to 45 c./s. with a volley of spikes for each pulse, but that continuous noise or sounds consisting of rapidly repeated pulses will produce adaptation and ultimately cessation of the discharge. This suggestion may be considered against the background of two hypotheses on moth behaviour in relation to auditory stimuli. Hinton[7] has proposed that night-flying moths may make use of echo-location to avoid obstacles, in the same manner as bats; the characteristics of the hearing organs as outlined above are very suitable for such a mechanism, but it has yet to be demonstrated that moths emit ultrasonic pulses. The second hypothesis, apparently first advanced by Richter[8] in 1909, is that night-flying moths avoid their typical predators (owls and bats) by taking flight in response to high-pitched sounds of short duration—characteristics of the cries of these animals. The little observation of behaviour that exists seems to support this latter view; Schaller and Timm[2] have shown that certain night-flying moths take flight or feign death on exposure to ultrasonic frequencies between 40 and 80 kc./s., and point out that this range includes those frequencies found in the cries emitted by bats. The present findings suggest a basis for further work in this connexion that might be more rewarding.

Chromosomes of Five Rodent Species

SATISFACTORY cytogenetic studies with existing laboratory mammals are at present virtually impossible owing to the large number and small size of their chromosomes. A small eutherian which could be bred in the laboratory and which had few, relatively large, chromosomes would be invaluable. Matthey's[1] recent count of $2n = 17$ in the fossorial vole, *Ellobius lutescens*, and the earlier report of $2n = 14$ in the South African insectivore *Elephantulus myurus*[2] (which, however, is questioned by Matthey[3]) encourage the hope that a suitable species may yet be found. Only about 120 rodent species, representing forty-nine of the 345 genera listed by Ellerman[4], have been studied cytologically. We have therefore examined the chromosomes of five African species which we have been able to obtain from laboratories in Great Britain.

Young males were used where possible. All animals were given an intraperitoneal colchicine injection (0·6–1·0 ml. of 0·1 per cent or 0·05 per cent aqueous solution) two hours before killing. The testes were cut up and put into distilled water or hypotonic saline for 5–30 min. before fixing in acetic-alcohol (1 : 3) for two hours, hydrolysing in *N* hydrochloric acid at 60° C. for 6–12 min., and staining in the Feulgen reagent. Squashes of short pieces of tubule

Table 1

Species	No. of animals	Chromosome No. n	Chromosome No. $2n$	Range of chromosome length
Rattus (*Mastomys*) *natalensis*, A. Smith	2	18	36	$2\cdot2\,\mu$–$9\cdot0\,\mu$
Mystromys albicaudatus, A. Smith	1	16	32	$1\cdot1\,\mu$–$4\cdot7\,\mu$
Meriones lybicus, Lichtenstein	3	22	44	$1\cdot3\,\mu$–$4\cdot0\,\mu$
Lemniscomys barbarus, L.	2	27	54	$0\cdot7\,\mu$–$2\cdot8\,\mu$
Saccostomus campestris, Peters	1	22	44	$1\cdot0\,\mu$–$4\cdot0\,\mu$

were made, sometimes after additional staining in aceto-carmine or aceto-orcein. Skins and skulls of the animals killed were submitted to Mr. R. W. Hayman, of the British Museum (Natural History), who kindly checked their identity.

Counts obtained at diakinesis or metaphase in primary spermatocytes, and at spermatogonial metaphase, are given in Table 1. Measurements made of the shortest and longest chromosomes in well-spread spermatogonial metaphases, one from each species, are also entered in the table. They are intended to give a rough estimate only of size and range of variation, and in any event are likely to be somewhat less than normal owing to the action of the colchicine. The numbers given for the first four species confirm counts obtained by Matthey[5,6] in papers which reached us after the work had been completed. The chromosomes of *Saccostomus campestris* (Fig. 1) have not been examined previously, so far as we know.

Although the main object was to determine chromosome number and size, two additional observations are worth recording. The presence of a prominent unpaired interstitial loop in the precociously condensed sex bivalent of *R. natalensis* at pachytene (Fig. 2) strongly suggests the presence of an intercalary differential segment such as Koller[7] has inferred to be present in the sex chromosomes of the cat. In *S. campestris* prominent darkly staining regions in the pachytene chromosomes regularly fuse together (Fig. 3), sometimes into more than one group, the arms radiating outwards like the spokes of a wheel and calling to mind the chromocentre and attached chromosome arms in the salivary gland nuclei of *Drosophila melanogaster*.

Chromosome counts on mammals can now be obtained quickly and accurately; the techniques are simple, and it is part of the purpose of this communication to encourage others to use them. Meanwhile we would be glad to examine the chromosomes of other, cytologically unknown, rodents or insectivores if material is sent to us. Although we are primarily concerned with finding a mammal with low chromosome number for experimental purposes, chromosome counts themselves may help to reveal biological situations of wider interest. For example, the recent counts made by Wahrman and Zahavi[8] indicate that the taxonomic species *Gerbillus pyramidum* in the Mediterranean area is a complex of several distinct chromosome races.

We are indebted to Mr. M. K. Totton, of the London School of Hygiene and Tropical Medicine Field Station, St. Albans, for *Rattus natalensis* and *Mystromys albicaudata*; to Dr. F. J. Aumonier, of St. Bartholomew's Hospital Medical School, for *Meriones lybicus*; and to Mr. O. G. Jones and the Zoological Society of London for *Saccostomus campestris* and *Lemniscomys barbarus*.

Note added in proof. We find $n = 15$, $2n = 30$, in testis material of *Elephantulus myurus* fixed in South Africa and sent to us through the kindness of Prof. B. I. Balinsky.

Cytoplasmic Inheritance in *Culex*

From an analysis of non-reciprocal fertility in *Aëdes scutellaris*, Smith-White and Woodhill[1] drew the conclusion that this phenomenon must be due either to anomalous meiosis in the course of oogenesis, with polarized segregation of bivalents and the elimination of part of the paternal genom, or to cytoplasmic factors acting independently of the nucleus. They state that "There is no critical evidence enabling a choice between the two types of hypothesis". Crossing relations in *Aëdes scutellaris*, as studied by Smith-White and Woodhill, are essentially similar to the more complex relations encountered in the *Culex pipiens* complex[2]. Some geographically representative populations are fully fertile in both directions, whereas others, although morphologically indistinguishable, are almost completely isolated by intersterility. In this case the limitations of a purely morphological species concept are obvious. A third group of populations is interfertile with the others in one direction only. Parthenogenesis, with pseudogamy, predetermination and multiple incompatibility genes can be excluded as causative mechanisms. These cases of strictly maternal inheritance can be explained only by the two hypotheses mentioned by Smith-White and Woodhill.

Further evidence is now available which may make possible a choice between the two hypotheses. Mutations induced by X-rays have been produced in *Culex pipiens*, and the mutant genes have been introduced into other populations with the view of studying their mode of inheritance. A description of some of these mutations is given elsewhere[3]. They are mostly clear-cut morphological characters affecting the antennæ, palps and wing venation. Four of them, at least, can be used to mark the two autosomes and the male and female sex chromosomes respectively. All of them segregate in clear-cut Mendelian ratios. There is no indication of polarized segregation (Table 1). Similar ratios are obtained on out-crossing to other populations. Thus the ratio obtained from the cross $+/+ \times Rap/+$, using the strains *O* (southern Germany) and *Alg* (Algiers), which can cross only in the direction ♀ *Alg* × ♂ *O*, is 147 : 143, = 1 : 1. Using the same strains, the cross $+/kps \times +/kps$ gives the ratio 253 : 81, which is 3 123 : 1. It will be seen that, in *Culex*, there is no evidence of abnormal behaviour of the chromosomes at meiosis and only the cytoplasmic hypothesis therefore remains.

An experiment now running in the forty-fourth back-cross generation seems to make possible a

Table 1. Mutations in *Culex pipiens*

Gene	Location	Status	Cross	Segregation in next generation	Ratio
kps	Autosomal (I)	Recessive	+/+ × *kps*/*kps*	All phenotypically normal	—
			+/*kps* × +/*kps*	178 normal : 56 *kps*	3·178 : 1
*Rap**	Autosomal (II)	Dominant	+/+ × *Rap*/+	331 normal : 332 *Rap*	1 : 1
var	Sex-linked with ♀	Recessive	+*M*/var. *m* × var. *m*/var. *m*†	All ♂♂ normal, all ♀♀ var.	—
Kpu	Sex-linked with ♂	Dominant	*Kpu M*/+*m* × +*m*/+*m*	All ♂♂ *Kpu*, all ♀♀ normal	—

* Homozygous lethal.
† *M* = ♂ sex-determining factor; *m* = ♀ sex-determining factor (ref. 4).

further distinction. Cytoplasmic inheritance may be independent of the nucleus with autonomous plasmagenes, or it may depend on nuclear cytoplasm-conditioning genes. Assuming normal meiosis, repeated incrossing of a foreign genom *B* into a given strain *A* can be made to result in replacement of genom *A* by genom *B*. A character independent of the nucleus of strain *A*, controlled by the cytoplasm, will not be affected by this change of genom. This is precisely the case in a long-running crossing experiment with strains *H* (northern Germany) and *O* (southern Germany). In every generation the hybrid (*H* × *O*) female was back-crossed to *O* males. After forty-four serial back-crosses of this kind, it may be presumed that the original genom *H* will have changed wholly or largely to *O*. Nevertheless, the mating type of the hybrid shows no change, that is, the hybrid males remain intersterile with *O* females, as in the original strain *H*.

Influence of Temperature on the Histological Evolution of the Ovotestis of *Cepea nemoralis* L.

THE conditions which determine the differentiation of indifferent gonocytes in hermaphrodite glands, either in the male or the female direction, constitute a major problem in the biology of sexuality. Ancel[1] showed in 1902 that in the ovotestis of pulmonates the differentiation of germinal cells was independent of the gonocytes, but depended on the appearance of nutritive cells. Ancel remarks: "Une cellule progerminative indifférente deviendra mâle ou femelle suivant les conditions qu'elle rencontre dans la glande génitale au moment de son apparition, conditions réglées par la transformation d'un certain nombre de cellules épithéliales en éléments nourriciers élaborateurs d'un matériel spécial". But experiments with undifferentiated strains of *Rana fusca* and *Rana sylvatica* (Witshi, Piquet[2,3]) have indicated that several factors, and more especially temperature, can condition gametogenesis.

Witshi and Piquet have pointed out that at an elevated temperature (30° C.) one obtains only males. Some are genotypically males, the others are inverted females. The female differentiating agent situated in the cortical part of the gland regresses whereas the medulla develops. The male differentiating agent then becomes preponderant. At low temperatures the opposite happens. The differentiation of gonocytes towards oogenesis or spermatogenesis appears here as a result of conditions prevailing outside the gonocytes, in this case in the cortex or medulla of the gonad.

It seemed interesting to me to follow the evolution of the ovotestis of Pulmonata at different temperatures. This work was carried out in the Zoology Laboratory of the University of Brussels, under the direction of Prof. P. Brien, to whom I am greatly indebted.

My observations were made on the snail *Cepea nemoralis* L. Four groups of animals were set up. The first three were kept at temperatures of 0°, 6° and 23° C., respectively.

The animals of the fourth group were reared in conditions approaching as nearly as possible those prevailing in hibernating animals; they were used as controls. For this group the average monthly temperature was established throughout the experiment as follows: November, 7·0°; December, 2·8°; January, 1·7°; February, 1·3°; March, 6·8°; April, 13·5°; May, 19·0° C.

At regular intervals during a period of seven months, the ovotestis was taken from a number of animals of each series and a study was made of their histology. A summary of the results follows.

(1) Low temperatures of approximately 0° C. inhibit all gametogenesis—both oogenesis and spermatogenesis.

(2) At a slightly higher temperature, 6° C., the development of male germinal cells is inhibited. In the meantime, oogenesis begins and proceeds at a higher rate than in the corresponding controls. The observations did not cover sufficient time to allow me to conclude whether spermatogenesis was definitely inhibited, or whether it was only slowed down.

(3) Controls influenced by seasonal environmental variations showed all aspects of gonad evolution, namely: (*a*) a period of no sexual development corresponding to the first months of hibernation (October to February); (*b*) oogenesis (March to April) including formation of oocytes (a fact already noted by Laviolette[4] in *Arion rufus*), which slowly increase in size; (*c*) spermatogenesis (April to May); this being much faster than oogenesis, the sperm will be ripe before the oocytes, the animal acting first as male then as female.

(4) A higher temperature (23° C.) promotes and maintains spermatogenesis, but without completely inhibiting oogenesis: a few oocytes differentiate but maturation does not follow.

It is concluded that temperature has an effect on sexual differentiation in the Pulmonata. A low temperature is more favourable to development of primary gonocytes in the female direction; and a high temperature promotes development in the male direction.

These results are similar to those obtained by Witshi on frogs; but in the case of the Pulmonata, hermaphrodite animals having a germinal epithelium ensuring simultaneously the elements of male and female germ cells, it remains to be shown at what level external factors such as temperature can act to influence sexual differentiation in one direction or the other.

Photostimulation of an Equatorial Bird (*Quelea quelea*, Linnæus)

Few data are available concerning the environmental factors involved in the 'timing' of the reproductive cycles of equatorial birds. The annual fluctuation of day-length on the equator is only about two minutes. Wolfson[1,2], considers it possible that "summation of daylengths or the daily dose of light", rather than increasing day-lengths as such, might be the critical environmental factor in determining the periods of migration and breeding of equatorial, as well as other, species.

Attempts to photostimulate tropical birds have been rare, and the results confusing. Scott and Payne[3] exposed guinea-fowl to additional illumination in the United States and ascribed the lack of response in this species to its tropical origin. On the other hand, Brown and Rollo[4] and Rollo and Domm[5] showed that the cycles of a variety of tropical whydahs and weavers (purchased in California) were modifiable by photoperiodicity.

Quelea quelea (Sudan Dioch), the weaver-bird used in the present experiment, ranges transequatorially over a vast area of the drier regions of Africa. In Tanganyika it nests colonially after rainfall. It is strongly nomadic and so an East African flock, sometimes several millions strong, may cross and re-cross the equator in search of food, and thus be temporarily exposed to either a minute increase, or decrease, in day-length according to its wanderings and the period of the year.

The present birds were trapped at about latitude 3·22° S. and were habituated to the aviary for more than a year, when the males were moulting out of the vivid breeding plumage into eclipse, and becoming indistinguishable from the dull-coloured females.

The normal breeding season in northern Tanganyika is in May or June provided that rain has fallen and conditions are favourable for nesting. At this period, day-length is diminishing at a rate of only seconds per day in the area in which our birds were collected. In other areas within a few hundred miles, reproduction occurs when days are slowly increasing in duration. Our experiment was begun on July 23 (day-length approximately 11 hr. 57 min.) at about the estimated end of the post-nuptial refractory period and before the next season's spermatogenesis began.

Forty-four individuals in or near eclipse plumage were divided into two groups of seventeen, and one of ten. These were placed in three almost identical cages with a diet of wheat, weed-seeds and water. The cages were of approximately 12 cu. ft. capacity; experience has shown that *Q. quelea*, accustomed to congregating in hundreds within a few feet, thrives in close confinement. The experiment was ended on September 17 (day-length approximately 12 hr. 5 min.) after being conducted as follows.

Cage 1. Ten control birds, under normal day-length.

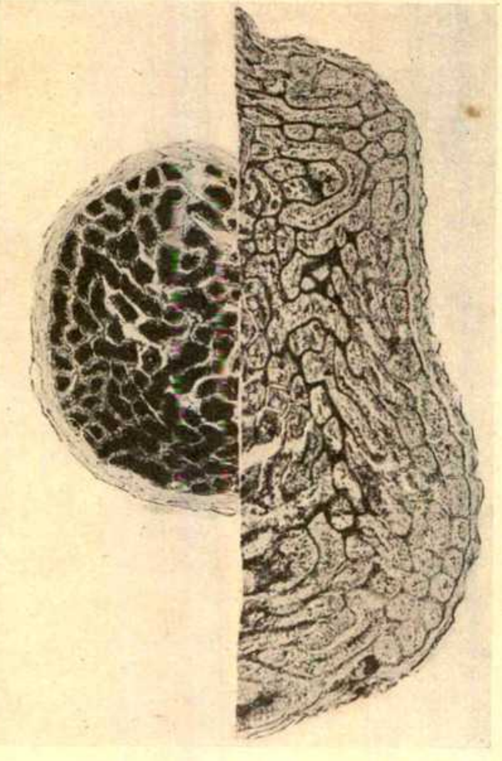
Cage 2. Seventeen experimental birds illuminated by a single 100-watt bulb 5 ft. from cage for five minutes daily at dusk (about 7 p.m.).

Cage 3. Seventeen experimental birds similarly illuminated from about 7 p.m. to midnight and receiving, therefore, an additional five hours light, making a total of more than seventeen hours of daily illumination. (These usually, however, appeared to be asleep by 10 p.m.)

The results were as follows.

Cage 1. (Controls, which were found to be five males and five females.) Each male had testes measuring 1 mm. × 1 mm. in diameter. In all birds the seminiferous tubules were still in a state of post-nuptial lipophanerosis in varying degree. The interstitium remained in a meagrely lipoidal condition[6] (Fig. 1*A*). The tubules in each case were 35μ in diameter, measured in the wax-embedded section. Each of the five females had oocytes invisible or only just visible to the naked eye.

Cage 2. (Plus 5 min. daily. The birds were found to be five males and thirteen females.) Each male had testes measuring 1 mm. × 1 mm. in diameter (similar to those of the controls) except one in which the dimensions were 2 mm. × 1 mm. and 1·5 mm. × 1·5 mm. In the tubules of each organ there



(*A*) (*B*)

Fig. 1. Photostimulation of *Quelea quelea* showing changes in size and internal arrangement of testes. *A*, Testis appearance in control birds and those subjected to five minutes additional day-length over a period of fifty-five days. The seminiferous tubules are still in the post-nuptial lipoidal condition (indicated by black material) and the interstitium remains undeveloped. *B*, Testis appearance of birds subjected to an additional day-length of five hours for fifty-five days. A lipoidal interstitium has developed (indicated by black material) and the tubules have cleared. (Formal-calcium fixation, sudan-black coloration at 7μ. × 53)

remained uncleared post-nuptial lipids (as in Fig. 1*A*), although only faint traces remained in the slightly enlarged tubules of the exceptional organ. The tubules of the smaller testes were of similar diameter to those of the controls. Those of the largest testes measured nearly 45μ in diameter, the increased dimensions being caused by a slight proliferation of spermatogonia. The interstitium was in each case similar to that of the control birds. Each of the thirteen females had ovaries in the same condition as those of the control group.

Cage 3. (Plus 5 hr. daily. The birds were found to be six males, ten females and one intersex.) Each normal male had testes enlarged to between 2 mm. × 1·5 mm. and 2·9 mm. × 2·3 mm. except one in which they were 1 mm. × 1 mm. in diameter. In all enlarged organs the increase in size was due to the production of several rows of spermatogonia resulting in tubule expansion up to 50μ. Post-nuptial lipids had been cleared (Fig. 1*B*). In the exceptionally sized organs the tubule diameter was only 35μ; but the tubules were almost clear of lipids. In all cases the Leydig cell cytoplasm of the interstitium had become sprinkled with lipid droplets. Each of the ten females had ovaries in the same condition as those of the two former groups.

The above results show that near the end of their post-nuptial testis metamorphosis, the males of this equatorial weaver-finch are susceptible to photostimulation making up a total daily illumination of about seventeen hours—a period not naturally experienced within its geographical range. Not unexpectedly, the females remained apparently uninfluenced (see also Whetham[7]).

The results give no support to Wolfson's "summation hypothesis". The birds which received an additional five minutes of light per day showed no significant gonad modification even though they received an additional grand total of 275 minutes, made up of five-minute increments over a period of fifty-five days. The normal annual variation of daylight at latitude 3·22° S. (at which these birds bred) is only about ten minutes. We subjected our + 5 min. experimental birds to artificial 'summation' equalling that which would be normally received over a period of more than twenty-seven years. There was no appreciable result.

Further experiments with *Q. quelea* of different ages, involving various light increments at different periods of the sexual cycle, are being undertaken. We believe, however, that it is the environmental conditions arising after rainfall, operating in conjunction with the internal sexual rhythm[6,8], that constitute the critical factors regulating the time of reproduction.

Yield Stress of Clay-Water Systems

I HAVE shown elsewhere[1] that the variation of specific viscosity (η_{sp}) with solid content (c) for concentrated sodium montmorillonite sols follows the Schultz–Blatschke relation[2] for systems of anisometric particles:

$$\eta_{sp} = [\eta]c + k'[\eta]^2c^2 + k'[\eta]^3c^3 \qquad (1)$$

$[\eta]$, the 'intrinsic viscosity', depends on the dissymmetry (p) of the dispersed and solvated clay platelets; while k' represents the particle–particle interaction at unit dissymmetry. At any sol concentration, $\bar{\eta}_{sp} = \eta_{sp} - c[\eta]$ will thus measure the contribution of this latter factor to the specific viscosity.

The precise interpretation of 'yield value' or 'yield stress' in clay sols is still a subject for speculation; but most theories approximate to the view that this property defines the shearing stress, at which the internal attractive forces between the dispersed particles have been overcome, and laminar flow prevails. One may thus expect the optimum yield stress (S) of a clay–water system to depend on some simple function of the particle interaction as expressed by $\bar{\eta}_{sp}$, and

$$S \text{ should equal } f(\bar{\eta}_{sp}) \qquad (2)$$

I have investigated the rheological properties of sols prepared from American, English and Mediterranean sodium and sodium–calcium montmorillonites, and kaolinites, under different experimental conditions; and have plotted the yield stress in terms of the property $\bar{\eta}_{sp}$. The Stormer viscometer has proved to be a satisfactory instrument for measuring both the optimum yield stress and the specific viscosity at low shear (corrected for the initial yield stress) over a wide range of conditions. Some typical results from these investigations are presented in this communication.

The variation of yield stress with particle interaction in any particular system is determined by the state of peptization or coagulation of the clay micelles. Sodium montmorillonite sols, when prepared in distilled water, exhibit the phenomenon of 'heterocoagulation' (that is, positively charged edges are orientated perpendicular to the negative faces of the clay platelets); and the results for sols prepared from a series of such clays of similar B.E.C. (80–90 m.equiv./100 gm.) but of different particle shape are presented in Fig. 1. (The ultimate particle size as determined by sedimentation techniques is in all cases of the order of 0·1 micron.)

At $\bar{\eta}_{sp} \ll c[\eta]$, the yield stress is negligible, even after standing for 72 hr. With increasing $\bar{\eta}_{sp}$, S rises rapidly and the following relation has been observed over a wide range of sol concentration and particle dissymmetry:

$$S = g\bar{\eta}_{sp}^2 \qquad (3)$$

The values of g increase in the order: clay D (Cyprus sodium montmorillonite) < clay C (English sodium montmorillonite) < clay F (North African sodium montmorillonite) < Wyoming bentonite; while Wyoming bentonite > hectorite. The first three were prepared from the corresponding natural calcium clays by interaction with sodium carbonate[1].

These values of g are related to the shape of the dispersed clay particle as demonstrated by their electron micrographs[3]. The strongest gels at a

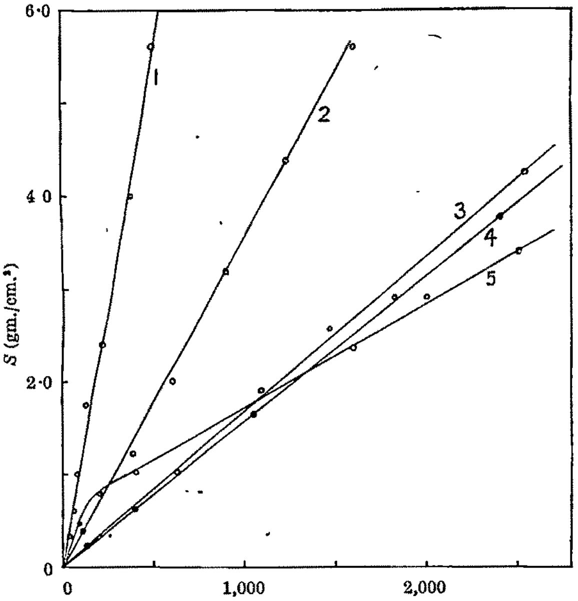

Fig. 1. Yield stress of sodium montmorillonite sols. Variation of $\bar{\eta}_{sp}$ with solids content (20° C.; pH 8·5): (1) Wyoming bentonite (ref. 3*a*); (2) clay *F* (ref. 3*d*); (3) clay *C* (ref. 3*c*); (4) clay *D* (ref. 3*c*); (5) hectorite (ref. 3*b*)

particular value of $c[\eta]$ are obtained with systems of large platelets, while needles and 'fluffy' platelets lead to weaker structures.

Heterocoagulation may be eliminated by heat treatment or by addition of certain anions that are strongly adsorbed on the positively charged edges of the clay platelets[4]. Addition of electrolytes such as sodium, calcium or aluminium chlorides to pre-solvated sodium montmorillonite sols, on the other hand, leads to rapid coagulation beyond some specific minimum electrolyte concentration, and results in a change-over from the 'house of cards' structure to an edge-to-edge association of clay platelets. The specific viscosity is reduced in the former systems, due to fall in the value of $[\eta]$; but the enhanced dissymmetry that results in the latter system leads to a marked overall rise in both specific viscosity and yield-strength.

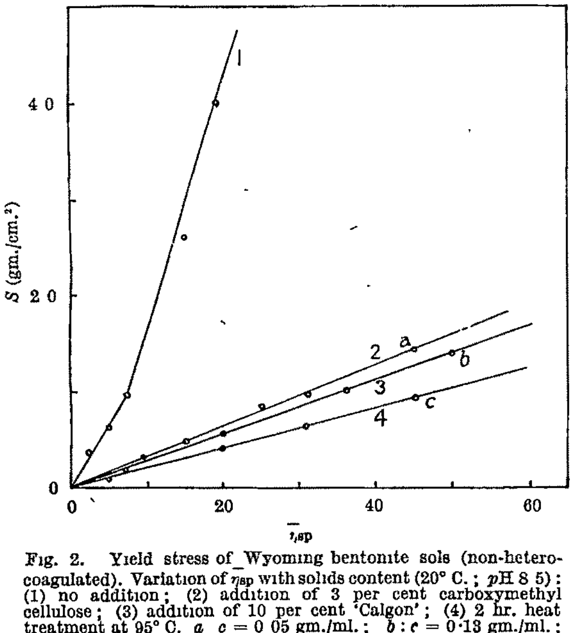

Fig. 2. Yield stress of Wyoming bentonite sols (non-heterocoagulated). Variation of $\bar{\eta}_{sp}$ with solids content (20° C.; pH 8 5): (1) no addition; (2) addition of 3 per cent carboxymethyl cellulose; (3) addition of 10 per cent 'Calgon'; (4) 2 hr. heat treatment at 95° C. *a* $c = 0$ 05 gm./ml.; *b*: $c = 0·13$ gm./ml.; *c*. $c = 0·03$ gm./ml.

In all such systems, S varies directly as $\bar{\eta}_{sp}$ over a wide range of conditions ($c = 0$–$0·16$ gm. per ml.; $\bar{\eta}_{sp} = 0$–60; $[\eta] = 10$–500); and (see Fig. 2)

$$S = g'\bar{\eta}_{sp} \qquad (4)$$

Similar results have been obtained with suspensions of the non-swelling calcium montmorillonites and kaolins.

g' increases in the same order as the constant g for heterocoagulated systems.

The experimental data clearly demonstrate that the yield stress of clay systems in which the internal attraction is mainly determined by short-range van der Waals forces varies directly as $\bar{\eta}_{sp}$ over a wide range of conditions. From equations (1) and (4) it is seen that at $C > 0·02$ gm./c.c.,

$$S = g'k'c^2[\eta]^2 \qquad (5)$$

According to Simha[5], $[\eta]$ varies approximately as p^2 (where p is the anisometry); while in the more concentrated sols, C will vary inversely as the particle separation ($\bar{d}$); and (5) may be written in the form

$$S = g'k'[p^2/\bar{d}]^2$$

For a particular value of p, the shape factor (g') is greatest for plates, and increases in the order plates > needles > spheroids. Such a relation for the internal attraction in systems of anisometric particles had indeed be derived theoretically in a recent work by Vold[6].

The factors affecting the yield stress in heterocoagulated systems will be discussed fully elsewhere.

This communication is based on work carried out in the Clay Development Laboratory, F. W. Beck and Co., Ltd., to which thanks are due for permission to publish it.

Carioazulene, Natural and Synthetic, derived from Caryophillene

IN the fractionation of hydrocarbons found in Copaiba balsam, we have isolated, from a bluish fraction, at a boiling point of 130°–136° C., under 0·2 mm. pressure, a compound with the typical reactions of azulenes, and which we propose to call 'carioazulene'. In an attempt to establish if its formation results from dehydrogenation of caryophillene, we submitted the remaining isolated fractions, consisting of caryophillene, to a dehydrogenation process using, respectively, selenium, sulphur and palladium under pressure, in an autoclave.

It was found that all caryophillene fractions resulted in the formation of azulene, the most convenient method being that in which a palladium–carbon catalyst (containing 11·36 per cent palladium) in the proportion of 4·7 catalyst to 100 caryophillene is used. Carioazulene may also be obtained using sulphur as a dehydrogenizer, the best proportion being 10 sulphur to 100 caryophillene. In both processes, temperature was increased to 280°–300° C. for a period of 40 min., while the internal pressure of the autoclave gradually increased to 20–25 atmospheres, due to release of gas. The proportions of palladium and sulphur mentioned give the best results ; if they are used in larger quantities, a polymer is produced. Of the two, the palladium – carbon catalyst furnishes the purer product.

At atmospheric pressure, selenium on asbestos heated to a temperature of 200° C., can be used. The results, as regards efficiency and purity, are much less satisfactory than those obtained with palladium – carbon or sulphur.

The caryophillene that fails to react, once the azulene has been extracted, can be used in new dehydrogenations and, when a palladium – carbon catalyst is used, the same portion may be employed again, always keeping the fixed proportion between catalyst and caryophillene. It is consequently preferable to proceed to successive operations using the same oil from which, by means of vacuum distillation, the resulting azulene is removed. Carioazulene concentrated fractions are purified in the usual manner, by means of acid treatments, by the formation of trinitrobenzenic derivatives and by passage through alumina columns.

Melting point of trinitrobenzoate (Kofler): 145°–147° C.
Trinitrobenzoate crystals: long reddish-purple needles.

These experiments are of special interest, because azulenes derived from natural products described until now possess the fundamental structure of *cyclo*pentano-*cyclo*heptane, whereas the carioazulene we have obtained probably originated from the *cyclo*pentano-*cyclo*octane fundamental hydrocarbon, clovene.

Urea Adducts of Glyceryl Esters

Glyceryl mono-esters are extensively used in the food and other industries, but the commercial products are often mixtures containing a range of fatty acids (free or combined), free glycerol and varying proportions of mono-, di- and tri-glycerides. The fractionation of such mixtures by classical methods is by no means easy, and in view of the importance of obtaining pure esters, we have investigated the possibility of fractionation with urea ; the formation of adducts between urea and various lipids has proved of value in the purification of various fatty acids and related compounds[1].

We have been able to show that urea adducts can be formed with glyceryl mono- and di-esters as well as with methyl and other simple esters ; similar results have been reported from other laboratories[2-4].

Beginning with a commercial preparation containing 39 per cent monostearin, and employing a stepwise extractive crystallization with urea in methanol solution, similar to that used by Abu-Nasr *et al.*[5] for the fractionation of fish oils, a fraction was obtained with a monostearin content of 86 per cent, representing 46 per cent of the monoglyceride originally present. By a variation of the urea concentration a higher yield of the monostearin fraction was obtained, but at the expense of the purity of the fraction (68 per cent). Martinez *et al.*[3], using mixtures of glyceryl esters, have also succeeded in producing monoglyceride samples up to a maximum of 74 per cent purity.

It has been shown[6] that mono-, di- and triglycerides can be fractionated by crystallization from solvents. Samples of the commercial glyceryl monostearate were therefore extracted with 90 per cent methanol at 30° C. and the soluble material treated with urea, giving a precipitate containing monostearin of 85 per cent purity (cf. original 39 per cent) in a yield of 79 per cent.

In further attempts to increase the monostearin content of the 85 per cent material, this was dissolved in methanol and treated with gradually increasing quantities of urea, the inclusion compounds being allowed to crystallize over a two-hour period. The most favourable results were obtained when the weight ratio of lipid, urea and methanol was 1 : 14 : 80 ; the lipid fraction in solution had a monostearin content of 90 per cent (in 83 per cent yield) in contrast to the precipitated lipid containing 58 per cent monostearin.

These latter experiments indicated that under the experimental conditions used, the distearin was preferentially precipitated by urea. Some of the results of Martinez *et al.*[3] confirm this conclusion ; but Heckles and Dunlap[4], in work with technical glyceryl monolaurate, concluded that inclusion compounds were more readily formed with the mono-esters ; they also showed that urea is of value in the separation of mixed monoglycerides containing fatty acids of different degrees of unsaturation.

The monostearin estimations were carried out by the method of Handschumaker and Linteris[7], which determines 1-monoglycerides only ; recent work[8] has suggested that considerable amounts of 2-monoglycerides may be associated with the 1-isomer in commercial mixtures. Thus the fractions we have obtained of 90 per cent monoglyceride content could contain up to 10 per cent of 2-monoglycerides, although it seems improbable that the latter compounds form adducts with urea.

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, January 23

British Society for the History of Science, Philosophy of Science Group (in the Joint Staff Common Room, University College, Gower Street, London, W.C.1), at 5.30 p.m.—Mr. R. J. F. Withers: "Logical Form and Explanation".

Institution of Electrical Engineers, Radio Section (joint meeting with the Measurement Section, at Savoy Place, London, W.C.2), at 5.30 p.m.—Mr. E. R. Wiblin: "Particle Accelerators".

Pharmaceutical Society of Great Britain (at 17 Bloomsbury Square, London, W.C.1), at 7.30 p m.—Mr. G. R. A. Short: "Essential Oils and their Pharmaceutical Applications".

Tuesday, January 24

University College, London (in the Anatomy Theatre, Gower Street, London, W.C.1), at 1 15 p m.—Prof. J. B. S. Haldane, F.R.S.: "The Second Indian Five-Year Plan".*

Royal Aeronautical Society (at 4 Hamilton Place, London, W.1), at 7 p.m.—Mr. A. A. Lombard: "Low Consumption Jet Engines".

Wednesday, January 25

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Prof. V. B. Wigglesworth, F.R.S.: "Insect Physiology in Relation to Insecticides" (Fernhurst Lecture).

British Institution of Radio Engineers, London Section (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W.C.1), at 6.30 p.m.—Symposium on "Electronic Methods of Pictorial Reproduction".

Society of Chemical Industry, Corrosion Group and Chemical Engineering Group (joint meeting with the Institution of Chemical Engineers, in the Large Lecture Theatre, King's College, Strand, London, W.C.2), at 6.30 p.m.—Dr. F. R. Himsworth and Mr. W. D. Clark: "Control of Corrosion in the Heavy Chemical Industry".

Society of Chemical Industry, Food Group—Nutrition Panel (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6.30 p.m.—Third meeting in the new series "Nutrition Requirements, and Food Fortification".

British Psychological Society, Medical Section (at the Royal Society of Medicine, 1 Wimpole Street, London, W.1), at 8.30 p.m.—Prof. T. Ferguson Rodger: "The Other Man's Point of View".

Thursday, January 26

University College, London (in the Anatomy Theatre, Gower Street, London, W.C.1), at 1.15 p.m.—Dr. K. A. Sinnhuber: "Sea-shores, Mountains, and Forests: the Struggle for Living-Space in Middle Europe".*

Royal Society (at Burlington House, Piccadilly, London, W.1), at 4.30 p.m.—Mr. B. F. J. Schonland, F.R.S.: "Benjamin Franklin—Natural Philosopher" (Wilkins Lecture).

Mineralogical Society (at the Geological Society, Burlington House, Piccadilly, London, W.1), at 5 p.m.—General Meeting.

Institute of Refrigeration (at the Institution of Mechanical Engineers, 1 Birdcage Walk, Westminster, London, S W.1), at 5.30 p.m.—Dr. H. I. Andrews: "The Development of a Steam Operated Refrigerator Van".

Friday, January 27

Institution of Mechanical Engineers (at 1 Birdcage Walk, Westminster, London, S.W.1), at 5.30 p.m.—Mr. D. A Wrangham, Mr. R. McCrae and Mr. W. K. Rooney: "Sandwich Courses".

North-East Coast Institution of Engineers and Shipbuilders (in the Lecture Theatre of the Mining Institute, Neville Hall, Newcastle-upon-Tyne), at 6.15 p.m.—Mr. C. E. Iliffe: "Nuclear Reactors for the Generation of Power".

Society for Analytical Chemistry (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6.45 p.m.—Annual General Meeting of the Microchemistry Group; 7.15 p.m.—Scientific Papers.

Royal Institution (at 21 Albemarle Street, London, W.1); at 9 p m.—Brig.-Gen. Sir Harold Hartley, F.R.S.: "World Needs and World Resources".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Research Fellow in Cosmic Rays at the University of Tasmania—The Registrar, University of Tasmania, Box 647C, G.P.O., Hobart, Tasmania (January 31).

Senior Research Fellow (with an honours degree in psychology and preferably experience in children's work) in the Department of Child Health—The Secretary, The University, Aberdeen (January 31).

Assistant Lecturer or Lecturer (with an honours degree and special qualifications and interests in either aesthetics and moral philosophy or the philosophy of science and mathematics) in the Department of Philosophy—The Registrar, The University, Liverpool (February 3).

Lecturer or Assistant Lecturer in Biochemistry—The Registrar, The University, Sheffield (February 4).

Lecturer (Grade II) or Assistant Lecturer (Grade III), and a Research Fellow, in the Department of Theoretical Mechanics—The Registrar, The University, Bristol 8 (February 10).

Physicist or Electrical Engineer, Experimental Officer grade (with at least H.S.C. (science) or equivalent), at a Ministry of Supply Armament Research and Development Establishment, near Sevenoaks, Kent, for experimental design of electronic systems of V T. Fuzes and associated trials equipment—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting D.604/5A/BN (February 10).

Lecturer/Senior Lecturer (preferably with qualifications and interest in either the history and theoretical foundations of psychology or psychometrics and individual differences) in Psychology at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, February 11).

Experimental Officer (with at least H.S.C. (science) or equivalent), at the London Headquarters of the Ministry of Supply to carry out reorganization of electronic post-design service work in industry and to assist in implementation of packaging directives and in technical progressing of miscellaneous electronic equipment development contracts—The Ministry of Labour and National Service, Technical and Scientific Register (E), 26 King Street, London, S.W.1, quoting D.586/5A/BN (February 14).

Chair of Applied Mathematics, Chair of Atomic Physics, Chair of Physical Chemistry, Chair of Petrology, Chair of Biological Oceanography—The Dean, Faculty of Science, Alexandria University, Moharram Bey, Alexandria, Egypt (February 15).

Lecturer (Grade I or Grade II) in the Department of Physics—The Registrar, The University, Birmingham (February 18).

Chair of Pharmaceutics at the School of Pharmacy—The Academic Registrar, University of London, Senate House, London, W.C.1 (February 27).

Head (with high qualifications in geology and experience in both teaching and research) of the Department of Geology—The Principal, Chelsea Polytechnic, Manresa Road, London, S.W.3 (February 28).

Assistant Lecturer or Lecturer (with a degree or diploma in horticulture and sound practical experience) in Horticulture, at Canterbury Agricultural College, The University, Canterbury, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (February 29).

Lecturer in Agriculture, with particular reference to Ecological Land-use Survey, at the University College of the Gold Coast—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1 (February 29).

Professor of Education, and Head of the Department of Education, at the University of the Witwatersrand, Johannesburg, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa, February 29).

Senior Lecturer in Clinical Biochemistry at the University of Melbourne, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, February 29).

Air Pollution Engineer (with a university degree in chemical technology or equivalent qualification and about twelve years experience in chemical engineering or allied activities) in the City Engineer's Department, Durban, South Africa—Messrs. Webster, Steel and Co., 3 St. Helen's Place, Bishopsgate, London, E.C 3 (March 16).

Director (with high scientific attainments, preferably in fields related to soils or crops combined with administrative experience either as head or deputy in the organization and running of a research institute or university department) of the Coconut Research Institute of Ceylon—The Chairman, Coconut Research Board, Department of Agriculture, Peradeniya, Ceylon (March 31).

Animal House/Laboratory Technician (male or female), to assist in experimental pathology in the Research Department—The Secretary and House Governor, Mount Vernon Hospital, Northwood, Middlesex.

Assistant Lecturer, Grade B (with an honours degree in chemistry), in the School of Chemistry—The Registrar, College of Technology and Commerce, The Newarke, Leicester.

Assistant Lecturer (honours graduate) in Zoology, and a Research Assistant (honours graduate) in Zoology—The Secretary, Bedford College (University of London), Regent's Park, London, N.W.1.

Associate Professor of Mathematics in the University of Alberta—Dean W. H. Johns, Faculty of Arts and Science, University of Alberta, Edmonton, Alberta, Canada.

Chemists (graduates, with or without research experience, mainly interested in physical and colloid chemistry)—The Director of Research, British Rubber Producers' Research Association, 48 Tewin Road, Welwyn Garden City, Herts.

Engineers and Physicists (particularly with electronics), Experimental Officer and Assistant Experimental Officer grades, at Royal Naval Scientific Service Experimental Establishments in the London, Portsmouth and Weymouth areas, Gloucestershire and Scotland—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting A.214/5A.

Experimental Officer (with H.S.C. (science) or equivalent, and preferably some experience of equipment employed in machine telegraph systems including teleprinters) at a Royal Air Force Signal Establishment at Kidbrooke, to work in a small team engaged on the development of small electromechanical and electronic equipment associated with machine telegraph systems—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting D.585/5A/BN.

GEOCHEMIST (with a good honours degree in chemistry or equivalent and some experience in inorganic analysis with special reference to rock and mineral analysis) IN THE GEOLOGICAL SURVEY DEPARTMENT, Tanganyika—The Director of Recruitment, Colonial Office, Great Smith Street, London, S.W.1, quoting BCD.105/8/09.

LECTURER (male, with a degree in agriculture and some general experience in tropical agriculture) IN AGRICULTURE at the College of Agriculture, Mauritius—Director of Recruitment, Colonial Office, 2 Sanctuary Buildings, Great Smith Street, London, S.W.1, quoting BCD 63/52/06.

MATHEMATICIAN (with an honours degree in mathematics) IN THE OPERATIONAL RESEARCH SECTION for work initially concerned with applying linear programming to problems of production scheduling, selection of order, etc.—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W.1, quoting "O.R.4".

PHYSICIST (with academic qualifications of degree standard or equivalent) in the Research Department of the Bank of England Printing Works—Staff Manager, St. Luke's Printing Works, Old Street, London, E C 1.

SENIOR TECHNICIAN (fully experienced in all branches of physics laboratory work, and, if possible, able to assist in general administration) IN THE PHYSICS RESEARCH DEPARTMENT—The Secretary Birkbeck College, Malet Street, London, W.C.1.

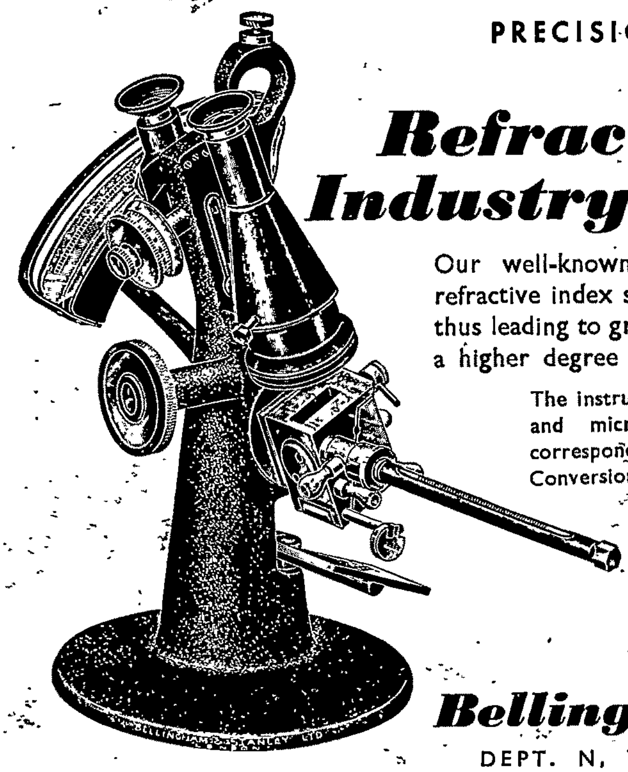
PRECISION BS INSTRUMENTS



Refractometers for Industry and Research

Our well-known standard Abbe type refractometer has a refractive index scale on glass and is read by transmitted light, thus leading to greater convenience in taking measurements and a higher degree of accuracy.

The instrument as illustrated is supplied with degree scale arc and micrometer screw reading directly to 10 seconds, corresponding to a refractive index accuracy within 0.00005. Conversion tables for use with sodium light are supplied.

Full particulars sent on application.

We shall be pleased to demonstrate these instruments and give any advice within our power, if you will call at our Works.

EDUCATION OF THE ADOLESCENT

IN a report to King George's Jubilee Trust Fund on the needs of youth, made shortly before the outbreak of war in 1939, Dr. A. E. Morgan urged the importance of a system of at least part-time continued education carried on during the working-day up to the age of eighteen years. We could not afford, he maintained, to let the boy or girl slip out of our care even at sixteen, let alone at fifteen. How far even yet we permit invaluable human capital thus to run to waste was shown in the report on "Early Leaving" which was published early in 1955; and perhaps with all the more force in that this report recognized that, for some boys and girls, no useful purpose would be served by keeping them at school even after fifteen years of age.

The need for some elasticity, however, increases the importance of due attention to the needs of youth in leisure and in recreation. Although, however, there are reassuring passages in the study of the influences affecting the upbringing of young people which the Council of King George's Jubilee Trust issued towards the end of 1955 under the title "Citizens of To-morrow"*, it is disturbing to find how closely the picture painted resembles that depicted by Dr. Morgan sixteen years earlier. To-day, even more than before the War, pleasure has ousted work as the main preoccupation of life: work is no longer an absorbing means of expression, but merely the device by which we can buy the comforts we desire and expect. It is endured for the reward to be reaped thereafter, and this is as true of the juvenile as of the adult worker.

Such an attitude strikes at the very root of voluntary work and service; and if these are to continue, the outlook and attitude of youth must be changed. In this, as elsewhere, the foundations of real national fitness must, as Dr. Morgan remarked, be laid on the bedrock of youth. Elsewhere he wrote of the advisability at some points of overcoming vested interests, where they may clash with the interests of youth, of the importance of recognizing that paid leadership in clubs and youth centres is a profession and that it is essentially educational, and that the problem of finding the right leaders in sufficient quantity is a matter of national urgency. He looked to the universities for co-operation in developing appropriate facilities for the professional training of club leaders.

The study which the Trust has now published is based on the reports of four working parties which inquired, respectively, into four phases in the upbringing of young people in Britain: that of full-time attendance at school; the influence of employment in the period after leaving school; the influences of leisure time; and the period in the Services. Even more emphatically than Dr. Morgan, these reports are unanimous as to the profound and enduring influence of parents. The working parties agree that in recent years there has been some weakening of the sense of parental and personal responsibility, and that a return to Christian principles offers the best hope of fostering a renewed sense of such responsibility. Thirdly, all four reports are concerned with the problem of dealing with the gap, both in education and in life, which, for most boys, now exists between the end of school life at fifteen and entry into national service.

As regards national service itself, it is thought that there is little fundamentally wrong with the present system, and adjustments required are mostly within the scope of the Services themselves. The generally satisfactory means of educational advancement offered by the Services should, however, be more widely known; and it is also recommended that employers should be persuaded to recognize a special responsibility towards the boy of fifteen to eighteen so that during those critical years he may be given general and physical education as well as serious vocational training. Furthermore, to arrest the existing educational deterioration of those who leave school at fifteen and are not apprenticed, this working party, which discusses the period in the Services, recommends that the Government should give serious consideration to the possibility of hastening the establishment in Britain of county colleges.

Apart from raising the school-leaving age to sixteen, the establishment of county colleges—both steps for which the Education Acts of 1944 and 1946 provide—is the only legislative step suggested by the study, and if a choice has to be made between raising the school-leaving age and the establishment of county colleges, the latter should come first. Both working parties concerned with the period after leaving school stress the importance of county colleges, and agree that the time is now ripe for their establishment. That concerned with the influence of employment believes that if management, employers' associations, chambers of commerce, trade unions and local education authorities ensured the proper functioning of these colleges by doing everything possible to increase facilities for day release, most school leavers would no longer virtually cease systematic education at fifteen. That concerned with leisure-time influences is no less concerned to see county colleges introduced at the earliest possible moment, because it believes that such colleges will enable young people to live fuller and more complete lives, permitting some of the gaps in the Youth Employment Service to be stopped and making possible the general assertion of the principle that when young people begin to work they should be learners as well as earners. It does not, however, believe that such colleges will ever supersede the youth service or make it unnecessary.

This particular report has much to say about strengthening the youth service and, apart from the expenditure of more money on it, there are suggestions regarding the training of youth leaders and the development of new techniques which deserve attention. Like other of the working parties, it also suggests the establishment of a national youth advisory council, though not in quite so well-defined a form as the working party concerned with employment. The latter proposes a national joint advisory council for youth, responsible to the Lord President of the Council and charged with considering action on the recommendations of the report and continuing concern for such investigation into problems of transition from school to working life. This recommendation is endorsed by the Trust in its commentary, and is probably the most far-reaching suggestion of the whole study.

---

* Citizens of Tomorrow: a Study of the Influences Affecting the Upbringing of Young People. Pp. 142. (London: Odhams Press, Ltd., 1955. Published on behalf of the Council of King George's Jubilee Trust.) 3s. net.

If the Government is not prepared forthwith to proceed with the establishment of county colleges, this recommendation at least should be implemented. It may require less immediate expenditure, but is almost certain to provide convincing evidence of the need for the expenditure on youth service and county colleges, etc., which the study recommends. Moreover, the establishment of county colleges has also recently been urged by Mr. M. L. Jacks in discussing the education of the young worker in his recent book, "The Education of Good Men"*. Mr. Jacks, seeing in the colleges of further education the precursors, on a voluntary basis, of the county colleges, emphasizes the value of the latter provided they are separated as completely as possible in terminology and all their associations from the world of school. One of their chief educational advantages is, he believes, in the opportunity such colleges afford in mixing boys and girls engaged in a great variety of occupations, and this variety should characterize every tutorial group.

Mr. Jacks believes also that the county colleges could meet the claims of religion, which he too emphasizes, provided religion is made a background to the life of the college, a normal and habitual element in its experience. Dr. P. F. R. Venables, in his recent book, "Technical Education", deplores the shelving of the county colleges as perhaps the bitterest of the post-war disappointments, and suggests we may wonder whether we will ever see a government with the wisdom and courage to establish county colleges. On a voluntary basis they will never meet the needs of more than a small fraction of the age-groups fifteen to sixteen years.

As a contribution to the provision of general education and offering a background for technical education even more than preventing the waste of human capital, it might be possible effectively to urge the development of the county colleges on the Government at the present moment. Mr. M. L. Jacks maintains that it is within the power and the duty of the schools to provide four things lacking in contemporary society: a respect for good work; a willingness for hard work; efficiency; and an ideal of service to be rendered to society in and through a man's daily work well done. All this bears profoundly on industrial efficiency and raising the level of productivity; and the survey of the relation of vocational and non-vocational further education and training which the National Institute of Adult Education published early in 1955 emphasizes particularly the value of residential education in this connexion. The very condition of living and studying together profoundly affects the flow of young people's sympathetic consciousness, and although the short-term residential colleges are still very new, they are already becoming well established.

The Committee which conducted this inquiry for the National Institute of Adult Education was greatly impressed with the value of even a short period of residence. It can easily turn interest into something much deeper, as well as transform the interest of the students for each other as people, and the Committee urged the establishment of intimate liaison between technical colleges and residential adult education colleges. In its view, residential colleges are in a unique position to mediate between the frequently divergent claims of the vocational and the non-vocational. They are ideally equipped to experiment with methods of teaching and discussion, and to discover what actual subjects can help to promote vocational and semi-vocational work of a liberal character. If the colleges succeed in the experiment with liberal vocational courses which they are conducting, the Committee hopes it will be possible to increase very considerably the number of residential colleges, so that they may make their contribution to technical education on a far wider scale.

The Committee thus suggests that a short residential course might come to be accepted as part of the vocational training of all full-time and day-release students. Concluding that lack of time excludes almost any of the values of a liberal education from vocational studies pursued at evening classes, except such as can be introduced through a broader treatment of the technical subject itself, it sees only one solution to this problem of general education for most young people: the establishment of county colleges. Only thus, it suggests, will further education be able to discharge its task of fostering a sense of pride in achievement and of responsibility in all levels of the working population.

This emphatic recommendation for the establishment of county colleges attracted little attention at the time. In the six months since the report was published, the recommendation has found strong support, however, not merely in the study published by the Council of King George's Jubilee Trust and in Mr. Jacks's book, but also in much that has happened in the industrial and economic life of Britain. Notably it would seem that the wider appreciation of the importance of an adequate general education at all levels, from that of the technician and operative to the scientist, technologist and manager, makes this an opportune moment to press the issue of county colleges as part of the provision for efficiently increasing the nation's production of technicians and technologists and scientists. It can be argued that it is an essential element in securing a continuous and increased supply of technologists, scientists and technicians who are really educated, and whose services will be far more efficiently used. Indeed, it may not be too much to urge that, unless some such step is taken, as part of a considered programme taking full account of the requirements of the nation at all levels and of the resources available, short-term as well as long-term, plans for the expansion of technological and technical education may ruin the educational system of Britain and lead to economic disaster.

---

* The Education of Good Men. By M. L. Jacks. Pp. 192. (London: Victor Gollancz, Ltd., 1955.) 13s. 6d. net.

If these dangers are to be avoided, it is important that our ideas as to the county colleges should be clearly defined, and that the functions which they are to fulfil in adolescent education and their relation to technical education at least, if only indirectly to technological education and university education, can be convincingly stated. It must be realized that money spent on the county colleges means less money available elsewhere—less for the expansion of the technical colleges, for the development of a selected few into colleges of technology, for the extension of the scientific and technological departments of the universities themselves and the building of new schools. Our plans indeed at every level must be conceived with imagination, but our vision must be tempered with realism and with a sense of perspective and of the part which each unit is to play in the functioning of the whole. Mr. Jacks gives us no blue-print in his recent book, but a sense of perspective and of the relation of each part to the whole informs and illumines the full sweep of his diverse comments on the educational scheme. That he is provocative—at times deliberately so—is all to the good and adds to the value of a lively and stimulating book. It should be read by all interested in educational policy from whatever angle, and perhaps not least by those who, following Sir Eric Ashby's argument, are seeking so to reconstruct adult education as well as that of the adolescent that man can preserve his status as an individual, giving new meaning to his civic rights and illumining his political rights with understanding.

AN INTELLIGENT MAN'S GUIDE TO THEORETICAL PHYSICS

The Laws of Nature

By Prof. R. E. Peierls. Pp. 284. (London: George Allen and Unwin, Ltd., 1955.) 21*s*. net.

THIS is a book on theoretical physics, intended for a reader who may have no previous knowledge of the subject and very little mathematical equipment. The material may be divided into four sections, each occupying about sixty-five pages: the classical theory of particles and of fields in vacuum; the atomic theory of the nineteenth century; relativity and quantum theory; and sub-atomic physics (high-energy electrons, nuclei and mesons). It may be noted that two of these sections are devoted to classical physics and two to modern physics. Prof. R. E. Peierls covers a very wide range of topics, for he starts with an exposition of elementary mechanics and ends with the application of field theory to unstable particles. The general methods and aims of theoretical physicists are discussed in an introduction and a short concluding chapter.

Prof. Peierls avoids the use of mathematical processes by expressing in words the meaning of such concepts as differentiation, divergence and circulation. His treatment is naturally that of the theoretical physicist; for example, he is not directly concerned with the experiments of Faraday but translates the equations of Maxwell into the simplest words he can find and discusses the predictions derived from certain solutions. The application of theories is sometimes followed in considerable detail (for example, in the treatment of the vector model of the atom or in the discussion of different types of mesons and hyperons).

Rutherford once argued (over a tea-table) that since the table is seen by the light which it reflects and an α-particle by the light of the scintillation which it causes, therefore one sees the α-particle in the same sense as one sees the table. Rutherford could make more difficult propositions sound very convincing, and it is true that the table is a picture—a logical construct—of one type of experience and an α-particle of another. The α-particle is just as real as the tea-table and the equations of field theory are just as real as either, but the ideas of theoretical physics are both unfamiliar and subtle. A Martian, newly descended from his Flying Saucer, could be taught the language of everyday life by pointing at common objects and naming them. There would be some mistakes. Malinowski found when he learned the Polynesian languages by this semantic method that sometimes he got the word for a part or a quality of the thing indicated. This kind of misunderstanding is easily cleared up when there is a sufficient background of common simple experience. For lack of this background, a physicist who showed a non-scientist a scintillation and said 'α-particle' would probably give him the idea that an α-particle is a flash of light. Even many a professional physicist would understand little if Prof. Peierls pointed to an equation and said 'anti-proton'. His task of explaining in the language of everyday life theories that are derived from experience, which is so different from that of everyday life, is no easy one.

Two thousand years ago, Lucretius wrote a book on the laws of Nature. He wrote with a purpose—to combat the darkness of superstition by the light of a scientific understanding of natural phenomena. His burden was lighter than that of a modern writer. There was a shorter tale to tell, and Lucretius was able to include an interesting theory of ghosts and phantoms as well as some advice on love and marriage. Yet he recognized that he had no easy task in taking science to the layman. He explained that it was necessary to "smear the cup with honey" in order to persuade the child to drink the bitter medicine. He therefore wrote in verse and illustrated his argument with interesting tales. Modern writers on popular science do not break into verse, but they nearly all feel the necessity of doing something to gain the attention of an unwilling reader. They seek to show the 'wonder' of science by anecdotes, epigrams, paradoxes and daring extrapolations from the actual to the conjectural. Lucretius was read for his poetry, but his ideas made little impression on the Roman world. The modern writer is too often remembered for his style, the substance being forgotten.

Prof. Peierls seeks to convey not the wonder of theoretical physics but its logical structure. He assumes that his reader is intelligent, that he wants to understand the subject, including the most difficult parts, and that he is prepared to make a considerable mental effort. None of the usual devices of 'popular' books is employed. The author tells a plain tale in simple language. This method cannot convey the elegance of the mathematics but, by using it, the author forces his reader to attend to the substance. He depends upon that alone to sustain the interest. My first impression was that too much detail had been included and too few illustrations, so that many readers would find the book difficult. I feared that rather few non-scientists would be sufficiently interested to complete the book. As an experimental scientist, I felt the need of some evidence and asked three friends to begin the book, not to proceed further than they felt inclined, and to inform me where they stopped. All three complained that the book was difficult, that there were not enough diagrams, that the argument was very involved in places, *but* each of them had finished the book. The number is too small for statistical conclusions, but perhaps the potential readers are more numerous than I thought. There may be quite a lot of people who prefer to climb a steep intellectual mountain—with the help of a qualified guide—rather than to look at photographs of the wonderful view from the top. In any event, it is well that one distinguished physicist should try the 'direct method' of teaching his subject to the layman.

Prof. Peierls says he wrote partly to clarify his own ideas. Nearly every professional physicist who reads this book will find that there is some point at which his own mind is less clear than he believed and that the author has both revealed and resolved the difficulty. R. W. DITCHBURN

FOSSIL PLANTS OF THE CARBONIFEROUS ROCKS OF GREAT BRITAIN

Memoirs of the Geological Survey of Great Britain

Palæontology. Vol. 4, Part 1: Fossil Plants of the Carboniferous Rocks of Great Britain. (Second Section.) By Dr. Robert Crookall. Pp. iv+84+24 plates. (London: H.M. Stationery Office, 1955.) £3.

THE first step in the publication of "Fossil Plants of the Carboniferous Rocks of Great Britain" was taken by Robert Kidston in Vol. 2 of the Memoirs of the Geological Survey, published in six parts between 1923 and 1925. They represented part of Dr. Kidston's researches on Carboniferous plants carried out during his long and active lifetime. Unfortunately, his death in 1924 put an end to this project and the description of British Carboniferous plants, which was largely based on his and the Geological Survey collections, was left incomplete. The parts which he completed dealt exclusively with the compression type of fossil plant and did not include petrifactions. The compression type of fossil is the common type encountered in sedimentary rocks and is of greater importance to the geologist than the petrifactions, which are mainly of botanical interest. The six parts included descriptions of most of the fern-like plants (ferns and pteridosperms). They are excellently illustrated memoirs and compare very favourably with any publication of a similar kind which appeared at that time. Similar illustrated memoirs had previously been published by French palæobotanists—Renault, Zeiller, Bertrand and others—in the "Études des Gites Minéraux", published under the auspices of the Ministry of Public Works; and Lesquereau, White and others described the coal measure floras of North America for the United States Geological Survey.

After a regrettably long interval, publication of the work started by Kidston has now been resumed, and it is very gratifying that the Geological Survey of Great Britain intends to continue this important work. In the interval, other countries, notably France, the Netherlands and Belgium, have produced magnificent monographs of plants of their coal-bearing formations and have to a certain extent anticipated part of the work Kidston had planned to do. Dr. Robert Crookall, author of this new part, while making use of some of Kidston's manuscripts and the magnificent Kidston Collection and other collections of the Geological Survey, has produced a volume which compares very favourably indeed with the earlier ones. He has brought our knowledge of the plants that he describes up to date and has added several new species to the British Carboniferous flora. In a clear and well-written introduction he explains the changes that have taken place in the scheme of classification of Carboniferous rocks since Kidston's time; these changes are largely due to the discussions and decisions taken at the congresses on Carboniferous stratigraphy held at Heerlen in the Netherlands in 1927, 1935 and 1952.

Dr. Crookall then describes the genera *Alethopteris* and *Lonchopteris*, two closely related genera of fern-like fronds which are almost certainly the foliage of pteridosperms. This is followed by the genus *Desmopteris*, a fern-like plant of uncertain affinities. He then describes the genera *Caulopteris* and *Megaphyton*, which are parts of stems that exhibit the scars left by the abscission of large fronds. *Caulopteris* and *Megaphyton* were evidently the stems of plants, some of which were almost certainly tree ferns, while some may have belonged to pteridosperms which had the habit of tree-ferns. Dr. Crookall describes several new species, one of *Caulopteris* and four of *Megaphyton*.

The descriptions are clear, and a comprehensive synonymy is given for each species. The photographic illustrations are excellent. This work is a worthy continuation of that started by Kidston, and it is to be hoped that other parts of this important series of publications on British Carboniferous plants will appear before long. J. WALTON

THE METAPHYSICAL STRAIN IN KANT

Kant's Metaphysics and Theory of Science

By Prof. Gottfried Martin. (Translated from the German by P. G. Lucas.) Pp. viii+218. (Manchester: Manchester University Press, 1955.) 21*s*. net.

IT was Hume who urged us to burn all metaphysical books, and Kant is often regarded as supporting him in this. What Kant is prized for is his elaboration of the principle that concepts gain significance only in so far as they serve to link actual or possible sense experiences, and, from this point of view, statements about what is not so conditioned have no sense. Kant, it is true, made many references to noumena, but these can be rejected as inconsistent with his fundamental doctrine. This, however, involves modifications—especially of his ethical doctrine—so drastic as to make one wonder. Did Kant really mean that no significant statements can be made about what lies outside the range of the spatio-temporal ? Did he even mean that there can be no good grounds for accepting such statements ?

Prof. G. Martin answers no to these questions. He holds, on the contrary, that a positive attitude toward metaphysics is fundamental even in Kant's theory of knowledge. Phenomena are essentially appearances to beings whose experience arises from the unification of materials received through sense. Kant always assumes that these sense materials arise through the stimulation of the receptive consciousness by noumena. The unifying consciousness is itself a noumenon and experiences itself as such in its moral decisions. Prof. Martin draws this conclusion from Kant's ethical writings, but shows that it is already foreshadowed in the "Transcendental Dialectic". Kant argues on ethical grounds that the concepts of freedom, immortality and God are not empty, but have application to the noumenal world. He applies to noumena the categories of "unity, plurality, causality, community, possibility, actuality and necessity" (p. 198), suggests that there is some correspondence between the sensible entities in the world and things in themselves, and speaks of God as the author of things in themselves.

Prof. Martin contends that in all this Kant is not being inconsistent, but is continuing and developing a long metaphysical tradition. He illustrates this in great detail, and suggests that the best way of interpreting Kant's view is to say that the categories are applied to things in themselves—not in the basic sense in which they are applied to phenomena, but "in an analogical sense" which does not give rise to knowledge, but for which good reasons can be given. He thinks this can be defended ; but he is mainly concerned with determining what Kant's actual views were, and his study is thoroughly interesting and suggestive. His discussion of Kant's theory of science (*Wissenschaftslehre*) deals only with the fundamental points, and, while it is very clear, contains nothing new, though it is well illustrated by references to modern developments in mathematics. The translation is admirable. L. J. Russell

---

QUANTITATIVE MICRO-ANALYSIS

Methods of Quantitative Micro-Analysis

Collected and edited by Dr. R. F. Milton and Dr. W. A. Waters. Second edition. Pp. xi+742. (London: Edward Arnold (Publishers), Ltd., 1955.) 70*s*. net.

THIS book is the second edition of the well-known volume which was first published in 1949. The general climate of micro-chemistry has changed greatly in the interval. In 1949 the applications of micro-techniques were few and not very widely used, but at the present day they are ubiquitous. The change is due to the advance in instrumentation and also, no doubt, to the availability of good text-books on the subject. The present volume consists of the original text by Drs. R. F. Milton and W. A. Waters, assisted by G. Ingram, J. T. Stock and K. M. Wilson, to which have been added two new parts on chromatography and micro-biological assay by S. M. Partridge with T. Swain and A. J. Amos, respectively. The general lay-out of the book is the same as that of the first edition, and the text of the first six parts is identical with the old text, except for certain additions to bring it up to date. These are mainly in Part 4 on colorimetric analysis, where a description of some of the more recent absorptiometers and spectrophotometers is grafted to the original stem. No attempt is made to evaluate the relative usefulness of the new instruments.

As methods are given that are based on the measurement of the absorption spectra of the test substances, it would not be irrelevant to ask why there is no section dealing with emission spectrography, which is perhaps the most useful and widely practised of micro-methods available to the analyst. If the authors feel that this is too specialized a field for their book, they might perhaps refer to the subject as they have done to electrophoresis in Part 5 on p. 425. Flame-photometry, too, might well have received some attention, as it is extensively used at the present time. In the section dealing with specific colorimetric determinations (Part 4), the references could be, in some instances, usefully extended. Thus the later work of Somogyi (*J. Biol. Chem.*, 19, 195 ; 1952) could be mentioned on p. 350. Under sugars, neither in the colorimetric section nor under chromatography is there a reference to the use of 2 : 3 : 5-triphenyltetrazolium chloride (Wallenfalls, K., *Angew. Chemie*, 23, 491 ; 1953). Again, under benzene, p. 359, some reference could well be made to the important work of Dolin (*Indust. Eng. Chem., Anal. Ed.*, 15, 242 ; 1943).

Part 7 deals with chromatography, and as everyone conversant with the modern literature will allow, it is quite impossible to compress this subject into eighty-three pages. The authors have kept to their usual plan of a short theoretical introduction followed by a good description of apparatus and technique, terminated by selected samples of detailed procedures. On p. 628, par. 3, they make some somewhat disparaging remarks about the accuracy of paper chromatography. These comments would, perhaps, have been better expressed as criticisms of the methods used for the final evaluation of the separated substances, for surely their separation on the paper is complete, even if no method exists for their accurate determination. In the inorganic field, the well-known book of Pollard and McOmie could, with advantage, be included in the references at the bottom of p. 628.

Part 8 is a description of methods of biological assay. The introduction follows the general plan of the book and is brief but adequate. The section dealing with the calculation of results is, perhaps, rather too mathematically profound for the brief treatment given to the rest of the subject. While the methods of E. C. Wood are, without doubt, of great value, it could well be stated that calculations based on simple graphs, used with intelligence, are capable of giving good results. Otherwise, analysts might reject these methods as being too complicated when, in fact, they are relatively easy to carry out.

The book as a whole is well produced, with bold chapter headings and satisfactory sub-headings. Both the author index and the subject index are easy to use. In the years to come, "Milton and Waters" will doubtless be a useful book for those engaged in micro-chemistry ; but if a third edition is contemplated, additions to the existing work will not be enough. The time will then have arrived when nothing but a complete re-writing will suffice.

Proceedings of the 1954 Glasgow Conference on Nuclear and Meson Physics

Edited by E. H. Bellamy and R. G. Moorhouse. (Conference sponsored by the International Union of Pure and Applied Physics.) Pp. ix + 352 + 5 plates. (London and New York: Pergamon Press, Ltd., 1955.) 63*s*. net.

THIS record of the 1954 Glasgow conference on nuclear and meson physics sponsored by the International Union of Pure and Applied Physics is divided into eight sections. The first four of these sections, which deal with nuclear constitution, properties and problems, occupy some two-thirds of the volume, while Part 5 collects the papers on π-mesons and Part 6 contains a few papers under the heading of field theory. The last two sections, dealing respectively with high-energy experimental techniques and with heavy mesons and hyperons, although short, are far from being the least interesting sections. Some particularly striking photographs illustrate Hildebrand's paper on bubble chambers.

Generally, each section of the book is introduced by one or two review papers; these give a comprehensive survey of the state of nuclear and meson physics in July 1954. Of some ninety other papers, the majority report on experimental results current at the time of the conference and discuss the implications of these results. As presented in the book, individual papers range in length from a few lines to several pages, and, although the space allocated to the various papers is not always an indication of their relative value, the editors and the publisher must be congratulated in making available a very adequate and readable account of the proceedings of the conference. Some significant points emerge in the edited version of the discussion which follows many of the papers.

To the many who may wish on occasion to use this book for reference purposes, the lack of an index will constitute a handicap. Paper titles, as listed at the beginning of the volume, are not in general a sufficient guide to the content of the papers. I feel that the extra labour required to index the subject-matter adequately would have made a useful book more valuable. J. C. BOWER

A History of Red Tape

An Account of the Origin and Development of the Civil Service. By Sir John Craig. Pp. vii + 211 + 12 plates. (London: Macdonald and Evans, Ltd., 1955.) 18*s*. net.

SIR JOHN CRAIG'S engaging account of the origin and development of the British Civil Service, as its sub-title indicates, goes farther back than E. W. Cohen's standard book, but makes no attempt to cover the decade and a half since that book was published, nor can it claim to be as serious a historical study. It is instead a readable and entertaining essay in which the author makes no attempt to disguise his own views and prejudices, particularly against the Trevelyan–Northcote reforms. On that question, and on the recruitment to the Civil Service by open competition, his highly critical remarks should be read in the light of Sir Edward Bridge's observations on the reforms of 1854 in a recent issue of the *Political Quarterly*, or of Prof. K. C. Wheare's lecture on "The Civil Service in the Constitution" to the University of London in 1954. Nevertheless, they remind the reader that there is another side and sound a note of caution to over-enthusiastic advocates of changes in methods of recruitment which R. K. Kelsall's recent study might stimulate. Sir John presents an immense array of facts in a most attractive guise and from an unusual angle, nor is the detail ever allowed to confuse the reader or his own prejudices to distort the picture. To the discussion on the adequacy of the Civil Service to the needs of to-day or the changes required in organization or elsewhere to increase its efficiency, his book makes no contribution except in so far as it gives a clear understanding of how the Civil Service came to be, and a warning as to directions in which change or reform requires caution and great care. There are an interesting list, up to the end of the nineteenth century, of literary men who held posts in the Civil Service, and a short bibliography that is remarkable no less for the inclusions than for the omissions. R. B.

Ferromagnetic Domains

By Dr. K. H. Stewart. (Cambridge Monographs on Physics.) Pp. xi + 176 + 7 plates. (Cambridge: At the University Press, 1954.) 25*s*. net.

IN his preface, Dr. K. H. Stewart states that "this book attempts to give a coherent outline of the fundamentals of domain behaviour . . .", and in the reviewer's opinion he has succeeded in giving a clear survey of the subject. It must be pointed out that the book was published more than a year ago, with the preface dated October 1953, and that there are few references to papers published after 1952.

An introductory chapter deals with the domain hypothesis and its implications, and then magneto-crystalline anisotropy, magnetostriction and the effects of stresses on magnetic properties are dealt with in some detail. There follow chapters on domain arrangements, with particular reference to single crystals, on the widths of, and energies in, domain walls, and on the factors affecting domain wall movement. The final two chapters briefly discuss time effects in magnetization and thermal energy changes involved in magnetization processes.

This is essentially a review of a subject which has expanded considerably in post-war years, and in only 170 pages a reader must expect some aspects to be dealt with most briefly. In particular, experimental detail—for example, the technique of producing domain powder patterns—has been reduced to the minimum. The book is well written and produced, and is fully illustrated with clear, though often rather small, diagrams. It will be of value to many, especially those whose interests lie on the fringe of this field and whose knowledge might otherwise end there. The information can easily be brought to the present date by consulting, for example, recent *Proceedings of the Physical Society*.

A Cuckoo in the House

By Maxwell Knight. Pp. ix + 80 + 6 plates. (London: Methuen and Co., Ltd., 1955.) 7*s*. 6*d*. net.

MR. MAXWELL KNIGHT took a young cuckoo from the nest of its foster parents and brought it up by hand. It became quite domesticated and very confiding. It was allowed full freedom and flew where it pleased, but remained with him until migration time, when after a display of restlessness it disappeared. In this little book, illustrated with some excellent photographs, he tells about the bird, its disposition and behaviour, discussing at the same time various cuckoo problems and bird problems in general. F. P.

THE THERMAL HISTORY OF THE EARTH

By Prof. J. A. JACOBS and D. W. ALLAN
Department of Physics, University of Toronto

ABOUT two years ago, a detailed study of the thermal history of the Earth was begun at the University of Toronto. First results of this investigation have been presented at several meetings[1]. It should be emphasized that this study does not pretend to have determined the temperature and heat-flow at different times and depths within the *actual* Earth, nor has it included every possible physical mechanism which may have played a part in the Earth's thermal regime. What has been determined is a method of calculating the temperature and heat-flow at a number of times in the past and at depths within a particular type of Earth model, namely, that of an Earth cooling by conduction alone, and in which the radioactive substances are distributed in concentric shells of uniform concentration. A number of Earth models of this type have been investigated covering a wide range of possible Earth structures and evolutions.

Briefly, what has been done is that the equation of heat conduction for a radioactive Earth has been solved with the aid of FERUT, the electronic computer at the University of Toronto. Details of the computation have been given elsewhere[2]. It is easy to show that the problem can be broken into two parts: the cooling of the Earth from its initial temperature, and the heating up of the Earth due to radioactivity.

The initial temperature depends, of course, on the origin of the Earth. Broadly speaking, there are two schools of thought: those that postulate a hot origin and those that postulate a cold origin. If the Earth had a hot origin, its thermal history may be traced from the time of solidification, the initial temperature being close to the melting point. If the Earth was formed by the cold accretion of dust particles, then, quite apart from radioactivity, it would heat up due to compression, although it may not have become completely molten. Fig. 1 shows four initial temperature curves that have been considered: (I) the melting point curve due to Bullard[3], with a temperature at the centre of the Earth of about 8,000° C.; (II) the melting point curve due to Uffen[4], with a temperature at the centre of the Earth of about 5,500° C.; (III) the melting point curve due to Jacobs[5], with a temperature at the centre of the Earth of about 4,500° C.; (IV) a temperature distribution due to a cold origin. If the heating effects of compression, the formation of an iron core, etc., raised the temperature to the melting point, cases I, II or III would apply. If these effects were not large, it is plausible that there would not be much variation of temperature with depth, and a constant value of 1,000° C. has arbitrarily been chosen. Variations from this value can easily be allowed for.

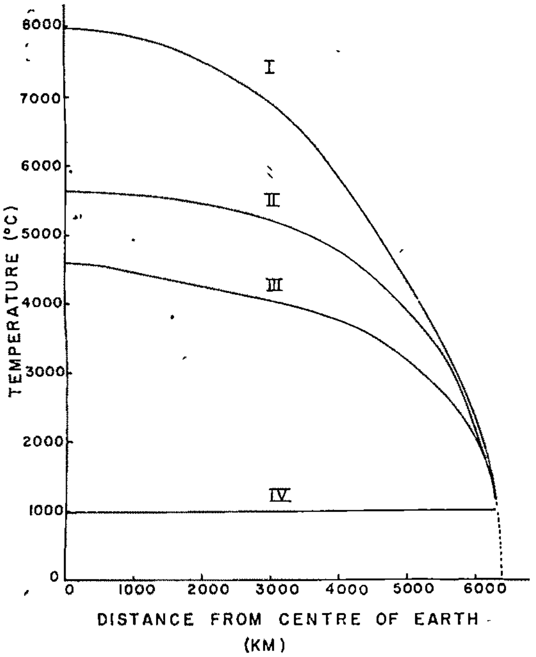

Fig. 1. Initial distribution of temperature

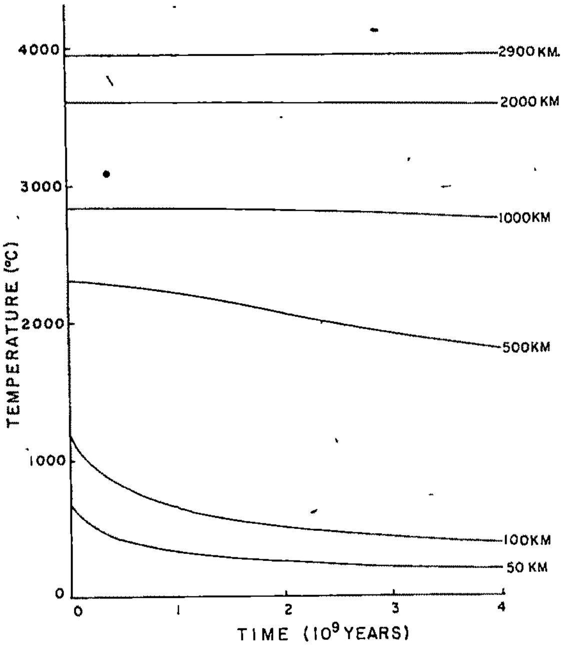

Fig. 2. Temperature–time distribution at various depths for a non-radioactive Earth (Model III)

Very similar features appear in the cooling of the Earth from any one of these initial temperature distributions. Fig. 2, which is for Model III, is representative of all four cases, and demonstrates how slowly temperatures change at great depths. At these depths thermal conditions are not greatly different from their initial values. Near the surface, on the other hand, cooling is considerable, and the surface heat-flow after four thousand million years is but little affected by the values taken for the initial temperature distribution in the first few tens of kilometres.

The second part of the problem, the heating of the Earth due to radioactivity, is far more complex, and

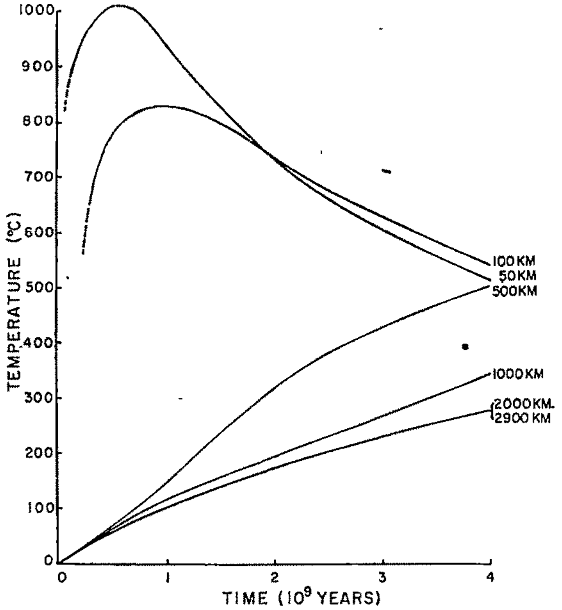

Fig. 3. Temperature–time distribution at various depths for a radioactive Earth (Model *B*)

a complete solution would have been impossible without the aid of an electronic computer. The method of solution allows for any desired concentration in nine shells. It is thus possible to approximate fairly accurately to quite varied distributions of radioactivity.

Four models have so far been investigated, all with the time at which cooling by conduction began taken as four thousand million years. This may be slightly low, since the age of the Earth is now generally believed to be about 4½ thousand million years[6]. However, an increase of 500 million years would not change the general behaviour of the various models considered.

Model *A* is a simplified one, and does not attempt to fit the details of crustal structure. This simplified model consists of three shells: a thin crustal layer 20 km. thick of granite–granodiorite composition, a uniform mantle of dunite, and a dense core of the composition of iron meteorites. Apart from the simplified crustal layer, this model is identical with one proposed by Bullen. Model *B*, originally due to Adams and Williamson, is considerably more detailed. A structure of four 15-km. layers is taken for the crust, with the top layer of granite–granodiorite composition, and the remaining three layers of composition changing from acidic to basic. From 60 to 1,600 km. the material of the mantle is identified as dunite and from 1,600 to 3,000 km. it is taken as of the same composition as pallasitic meteorites. The core is again identified with iron meteorites. The temperatures at different depths in the Earth at different times in the past for this model are shown in Fig. 3. It can be seen that at depth there is a continual increase in temperature, whereas near the surface, after a very rapid rise, the temperature begins to decrease with time. Model *C* is a modification of Model *B*, reducing the radioactivity in the surface layers. For this model a structure of two 15-km. layers is taken for the crust, instead of the four of Model *B*. Thus the layer of dunite extends from 30 km. to 1,600 km. Finally, for the sake of comparison, Model *D* was constructed, which allows for a uniform distribution of radioactivity. Although the same continual increase in temperature at depth with time occurs, the rapid rise followed by a decrease near the surface is absent in this case. Instead, near the surface, temperatures gradually increase with time, but at a much slower rate than at depth. This is due, of course, to the removal of the high concentration of radioactivity in the crustal layers, which is a feature of the other models. It should be noted that the identification of the Earth's mantle with chondritic meteorites is now thoroughly discredited[7], and no model with the relatively high concentrations which such an identification would entail has been considered.

The complete thermal picture of the Earth requires adding the cooling of the Earth from its initial temperature to the heating up of the Earth by radioactivity, that is, combining any of the four models I, II, III or IV with any of the four models *A*, *B*, *C* or *D*. This allows for sixteen possible combinations, and it is not practicable to reproduce them all here. However, many similarities between the models exist. Fig. 4 gives the temperature distribution for Model III *B*, which is representative of a hot origin of the Earth. In spite of the extremely low concentrations of radioactivity in the deep mantle and core, there is still a heating up there of two or three hundred degrees. Near the surface, conditions appear to have been greatly different in the far past from those existing at present—in fact, there may even have been remelting of material near the surface (down to about 100 km.) during the first thousand million years or so. If so, this could explain the now fairly well established fact that the Earth as a whole is about 4½ thousand million years old[6], whereas no rocks have been found much older than about three thousand million years. (A similar suggestion was made by W. D. Urry some years ago[8].) However, this brief temperature rise at the beginning soon ceased and cooling commenced. The rate of cooling was greater in the past than it is now, and this suggests that orogenetic activity may have decreased

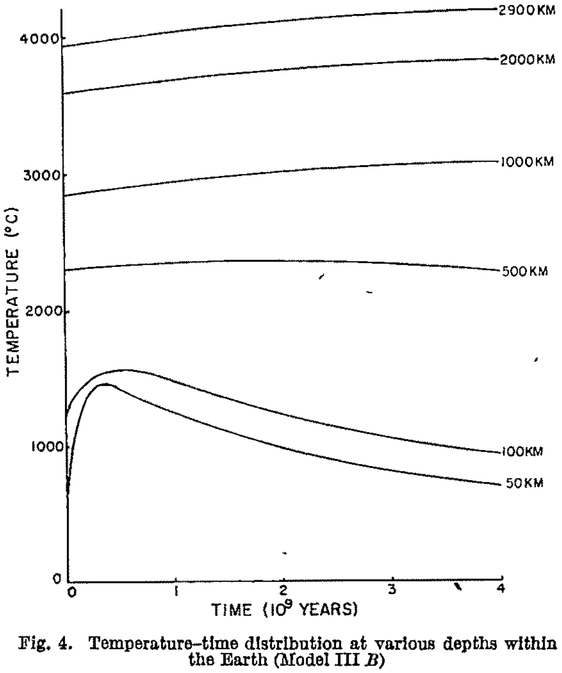

Fig. 4. Temperature–time distribution at various depths within the Earth (Model III *B*)

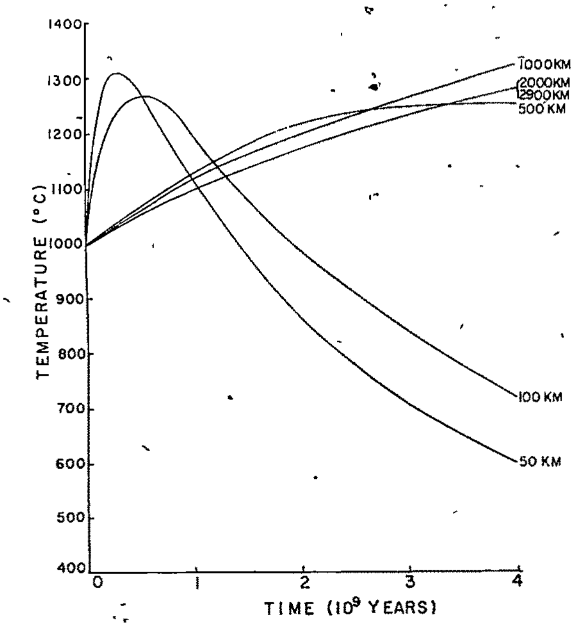

Fig. 5. Temperature–time distribution at various depths within the Earth (Model IV *B*)

with time, and perhaps have been caused by different processes in the far past. The present temperatures at depths of 50–100 km. differ by as much as 200° C. between Models III *A* and III *B*. These models are representative of conditions beneath the oceans and continents, and such a temperature difference may well exist and have an important bearing on orogenesis. Fig. 5 gives the temperature distribution for Model IV *B*—an Earth with a cold origin. Here the thermal history is very dependent on the value assumed for the constant initial temperature. As shown in Fig. 5, if this is taken as 1,000° C., there is heating at depth and an initial temperature rise near the surface, as before. For a value of 2,000° C., there is no initial rise near the surface.

In conclusion, two points stand out from the investigation so far carried out. First, all the models of the Earth studied indicate that the temperature at depth has continued to increase throughout geological time, the temperature at the core boundary having increased most probably by about 300° C. Secondly, although radioactivity plays a major part in the thermal history of the Earth, the initial distribution of temperature dominates thermal conditions at depth and near the surface for the first thousand million years or so. The cosmological questions involved in the origin of the Earth cannot unfortunately be shelved. The discovery of radioactivity, although helping to solve many geophysical problems, cannot in itself wholly explain the Earth's thermal regime.

PRODUCTION AND UTILIZATION OF ELECTROMAGNETICALLY ENRICHED ISOTOPES

DURING September 13–16 a conference on "The Production and Utilization of Electromagnetically Enriched Isotopes" was held in the Cockcroft Hall at the Atomic Energy Research Establishment, Harwell. This was the first meeting to have been arranged on the subject since details were declassified of the calutrons which are now used for enrichment of the isotopes of all the elements. The meeting was attended by Dr. C. P. Keim, Dr. C. E. Normand, and Mr. Boyd Weaver (Stable Isotope Division, Oak Ridge National Laboratory, United States); representatives of separator groups at Copenhagen, Amsterdam, Paris (Commissariat à l'Énergie Atomique, Saclay), Stockholm, Upsala and Gothenburg; members of interested groups in Egypt, Yugoslavia, Belgium and Western Germany; representatives of the nuclear physics departments of a number of universities in Great Britain; members of the group concerned with electromagnetic separation at Harwell; and other interested research workers. An unusually lively meeting resulted. The programme covered the following fields: ion sources, collector problems, chemical aspects and target preparation, utilization, analysis of isotopic abundance, the design of electromagnetic separators, and the use of the separator for active materials as a tool in nuclear research.

The conference was particularly concerned with the stable isotopes other than those of the elements hydrogen, carbon, nitrogen and oxygen, which are enriched by other methods and the application of which has been abundantly dealt with in a variety of reviews. Mr. D. W. Fry, chief physicist of the Atomic Energy Research Establishment, welcomed the delegates and briefly reviewed the twenty-eight papers to be given

Ion Sources

At the session on ion sources, held under the chairmanship of Dr. P. C. Thonemann (Harwell), the first paper was by Dr. Normand, of the Oak Ridge separator project, who described the ion sources used in the calutrons. At first the ion source at Oak Ridge was heated by resistance-type (calrod) heaters embedded in the cast-copper charge oven and arc-chamber support block. The service temperature-limit for heaters of this type restricted the operating temperature to about 700° C. or less, even when the casting of the charge oven was surrounded by stainless-steel heat shielding. The substitution of graphite components for the copper source castings, and of graphite strip heaters for the embedded calrod heaters, resulted in a source capable of operating at regulated temperatures up to approximately 1,000° C. In order to vaporize metals of the platinum and palladium groups directly into the ionizing arc, a third type of source was developed in which heating was by means of high-energy electron bombardment.

Prof. J. Kistemaker then described the ion sources of the Amsterdam separator, which is a 180° machine having an ion output of up to 10 m.amp. In particular, he gave a description of the five types of breakdown of the high voltage used in the acceleration of the positive ions from the ion source. Mr. O. E. G. Almén described developments of ion sources in Scandinavia. At present the magnetic type is used exclusively, with the magnetic field either parallel with, or perpendicular to, the direction of the extracted ion beam. A feature of the Copenhagen source is the use of a vacuum lock for the introduction of the source material so that separation can be made with very short-lived isotopes.

Great interest was aroused by the description, by Dr. R. Bernas (Paris), of a new sputtering-type ion source suitable for the elements of low vapour pressure. In this method the element is sputtered into the arc chamber using a primary argon discharge. This source is still under development, but is extremely versatile and has valuable possibilities for the separation of radioactive elements produced, for example, by bombarding a foil in an accelerator. Dr. R. H. Dawton then reviewed experimental work at Harwell during the past few years on a number of ion sources, including filament sources, radio-frequency types, a sputtering type, a Kunsman source, and sources depending on thermal ionization. Some of these sources have been realized in practice and are being used with the new sector separator recently constructed at Harwell.

Collector Problems

For the second session, on collector problems, Dr. J. Koch (Copenhagen) was in the chair, and the proceedings opened with a description by Dr. Normand of the unit used for collecting heavy ion beams at Oak Ridge. These beams may amount to more than 100 m.amp. at 30 kV., and the difficulties were concerned with the space available as well as the problems of dealing with the energy dissipation and collector erosion. The special constructions which are used to minimize losses by evaporation and sputtering were described and also the arrangements used to prevent cross-contamination of isotopes. A more detailed description was given of the refrigeration system necessary for mercury collection, and of the special collector arrangements. Dr. M. L. Smith then dealt with experience at Harwell in the same problem, discussing particularly the chemical contamination of isotopes. He also described arrangements suitable for the collection of the very volatile elements such as sulphur and chlorine, the gases oxygen and nitrogen, and the rare gases.

The problem of the collection of mercury was returned to by Dr. Ranc (Saclay atomic energy group), in whose system the source is supplied with mercury vapour while collection is achieved on gold foil cooled with liquid nitrogen. To obviate contamination from the mercury vapour existing in the tank at room temperature, a secondary liquid-air trap is placed near the source and provided with a slit, so that only the directed mercury ions can pass.

Chemical Aspects and Target Preparation

In the session on chemical aspects and target preparation, under the chairmanship of Mr. Boyd Weaver (chief chemist of the Oak Ridge Stable Isotope Group), Dr. K. O. Neilsen (Copenhagen) considered the penetration of ions into solid lattices. This problem is important in connexion with the preparation of gas targets and is also of interest to several other studies such as that of the recoil atoms from nuclear reactions and, in particular, the field of radiation damage. The theoretical conclusions obtained from his work were compared with experimental studies by nuclear reactions which enable the distribution in depth to which the ions have penetrated to be found.

Other methods of preparing separated isotopic targets for nuclear reaction studies were described in the next paper by Dr. Smith. He commented on the advantages of a central station for isotopic target preparation, considered the requirements for nuclear targets and described some typical techniques. The most versatile is vacuum evaporation, which besides its application to salts can also be used for evaporation of the refractory metals such as magnesium and silicon to give elemental deposits by using tantalum filaments as a source on which the oxide is reduced. This method can also be used for the preparation of metallic targets of the alkali and alkaline-earth metals, and special handling techniques were described by Dr. Smith for these. Direct deposition in the separator is used for various gases and for boron, which stays down with less than 10 per cent sputtering on a variety of metallic backings.

Mr. Boyd Weaver then described in some detail chemical aspects of the work on electromagnetic separation, dealing first with the preparation of charge materials. So far, more than fifty elements have been separated, and in most cases some special chemical operations have been necessary or helpful in the supplying of suitable charge materials for the separators. Whenever possible, a variety of forms of each element has been prepared in order to make comparisons between halides, oxides and elements. Improvements in operating efficiency have been attained by applications of such techniques as vacuum dehydration and pelletizing. Half the elements still unseparated consist of the rarer rare earths. In order to make as much as a kilogram of each of these available, various methods of separation have been explored. Separation by continuous counter-current extraction between nitric acid and tributyl phosphate has been developed and applied to the preparation of unusual quantities of these elements.

Turning to the processing of the enriched material in the collectors, Mr. Weaver pointed out that these are always contaminated by a large number of other elements which have to be removed in order to obtain the pure material needed for nuclear research. The purifications require an unusual type of quantitative analytical chemistry, in which the emphasis is on separation rather than on measurement of quantities. Purification schemes suitable for quantities from milligrams to grams have been developed for each of the elements.

Applications of Electromagnetically Enriched Isotopes

In this session the chairman, Dr. Keim, gave a wide-ranging review of the achievements of the stable-isotopes programme in the United States, which, so far, has involved the dispatch of more than 2,600 consignments of stable isotopes to users in sponsored establishments of the Atomic Energy Commission, government agencies, universities and industries. Dr. Keim pointed out, however, that the contributions which stable isotopes are making to basic science and in a growing number of practical applications are not widely appreciated. This is largely because stable isotopes are at present of greatest value to the research physicist in fundamental investigations which receive little publicity. There is also a reluctance to use enriched samples, as they appear to be expensive, although, in fact, only small quantities may be needed, while other savings may justify their use. They are, too, more difficult to use than radioisotopes, but improvements in mass-spectrometry techniques will help here.

Dr. Keim quoted the immense range of work already published and went on to describe a few particular applications of stable isotopes. These included: their use as starting materials in the assignment of masses to artificially produced radioisotopes and in investigations of their disintegrations; the determination of neutron absorption, scattering, and total cross-sections at all neutron energies; atomic spectroscopy, especially in the study of hyperfine spectra, isotope shifts, nuclear spins, etc.; the determination of nuclear energy-levels, and studies of isomerism; superconductivity, self-diffusion, coefficients of expansion and other solid-physics studies; β-spectroscopy using enriched isotopes like potassium-40 and beryllium-10; use for pile and cyclotron bombardments to produce radioisotopes of high purity and high specific activity, and to produce certain isotopes otherwise unavailable at a reasonable cost; use as tracers in isotope-dilution analysis, a technique which is now being increasingly applied in geology, agriculture, metallurgy and biology.

Dr. W. D. Allen (Nuclear Physics Division, Harwell) then described the investigations which have been carried out with materials supplied by the separator group at Harwell. He illustrated his lecture by details of a few particular investigations out of many which have been carried out during the past five years using the six hundred and fifty consignments which have so far been dispatched by Harwell to users in many countries. Dr. Allen first described reaction studies with the van de Graaff and Cockcroft–Walton machines and then gave a detailed review of a variety of studies using neutrons, describing, in particular, the current work on fast-neutron capture in the Zephyr reactor. This work refines the earlier studies by D. J. Hughes of the variation of cross-section with atomic weight which has some cosmological implications and also throws more light on the magic-number nuclei.

Dr. Allen considered a variety of other topics, including β-ray studies; (n,p) reactions using 14-MeV. neutrons; several other reaction studies; and photo-disintegration. In a forecast of future work with electromagnetically enriched isotopes he said that the work on neutron cross-sections in all energy-ranges is only just beginning. Studies in Coulomb excitation show much promise; the work with 1-MeV. high-tension sets in many universities will continue and will gradually extend to the masses in the range oxygen-16 to calcium-40. He also mentioned tritium and helium-3 reactions and the very interesting subject of double β-decay.

Dr. J. C. Kluyver (University of Utrecht) then described the investigations he has been making on (p,γ) reactions using enriched isotopic targets of magnesium and silicon. It is imperative to use enriched targets for this study in order to assign correctly each proton-capture resonance. With a non-separated target, this assignment is very difficult as aluminium-25 and -26 have nearly equal half-lives, and the long-lived aluminium-26 may easily be confused with the stable aluminium-27 as product nucleus. As natural magnesium contains 79, 10 and 11 per cent of the isotopes of weight 24, 25 and 26, respectively, isotopic targets of magnesium-25 and -26 are nearly tenfold enriched, and a corresponding gain in the γ-ray yield is obtained. Also, the analysis of the weak ^{25}Mg (p,γ) resonances is greatly facilitated by the reduction in the intensities of the forty-times stronger ^{26}Mg (p,γ) resonances in their neighbourhood. From this work the energy-level schemes of aluminium-26 have been worked out. The use of isotopic targets of other elements in (p,γ) reactions will have similar advantages.

Dr. H. G. Kuhn (University of Oxford) then gave a polished account of applications in spectroscopy and in solid physics. He said that the differences in the masses of isotopes give rise to vibrational and rotational isotope effects in molecular spectra. Their study, either by optical or microwave methods, can be an important aid in the analysis of spectra. In atomic spectra the mass effect is predominant in the lighter elements, and its study is necessary for isolating the more important 'volume effects'.

A great variety of interesting spectroscopic effects are caused by differences, between the different isotopes, of their values of nuclear spin (I), magnetic moment (μ), electric quadrupole moment (Q) and distribution of charge inside the nucleus. Investigations of these effects are often very difficult, and sometimes impossible, unless highly enriched isotope samples are available. Light sources containing certain pure or highly enriched isotopes can produce very highly monochromatic light. This property makes them suitable for use as wave-length standards, for interferometric measurements of gauges of great length and for purposes of adjustment of interferometers of long path.

Most properties of solids depend on the atomic masses, and the study of isotope effects can be a powerful means of testing the validity of theories. Such effects are usually small and difficult to measure, but some variable results on the transition points of supraconductivity and on the rate of change of electrical resistance of metals with temperature have already been obtained. Apart from their bearing on the theories of conduction and supraconductivity, results of this kind are likely to contribute generally to the knowledge of the structure of solids.

Isotopic Abundance Analysis

The session on isotopic abundance analysis, with Prof. J. H. E. Mattauch (Max-Planck Institut für Chemie, Mainz) in the chair, was one of the most vigorous of the conference. It opened with an account by Dr. Keim of work at Oak Ridge, where the mass-spectrometry section is concerned with analysis of samples from the separator group and also with a variety of research problems in collaboration with many institutions. During the past few years the tendency has been to move to techniques for the less-volatile elements requiring high source-temperatures, and so special furnace and thermal ionization methods have been especially developed. Techniques of small-sample loading employing micro-pipettes and a microscope were described, and the advantages and problems of working with extremely small samples of a few micrograms were discussed. Details were given of a range of instruments developed in the group, including one made by the General Electric Corporation. Mr. G. H. Palmer then described the work at Harwell in this field. He said that, as in Oak Ridge, the emphasis has been on handling solid samples rather than gases, and described the precautions necessary for this kind of work. In particular, he discussed the difficulties of quickly comparing samples and obtaining ion beams of constant intensity. He then described a new mass spectrometer which has been developed at Harwell, in association with Metropolitan-Vickers Co., Ltd., especially for solid analysis and which incorporates both furnace and triple-filament assembly types of sources together with a variety of detection devices. In a selective review of Harwell work, he described results obtained with lithium, lead and uranium. Mr. Palmer then went on to read a paper by Prof. G. D. L. Schreiner and Dr. R. T. Jamieson (Johannesburg) on age determination by isotopic-dilution techniques. This was a valuable and detailed discussion of the theoretical basis and the errors in the technique, with particular emphasis on the rubidium–strontium method.

Among the papers at this session was a notable contribution by Dr. H. Hinterberger (Mainz). He first dealt with the principles and mass-spectrometric techniques used in isotopic-dilution methods, and then went on to survey work in this field. After a discussion of the potassium–argon method used in the determination of the age of the Earth, he described his own recent contribution with the newly developed rhenium–osmium method. This very interesting work is probably a unique example of the success of mass spectrometry over the counting methods.

The last paper of the session, by Dr. A. H. Gillieson (Chemistry Division, Harwell), discussed methods other than mass spectrometry by which measurements may be made of isotopic abundance. The methods dealt with can be briefly listed as: neutron source methods (neutron absorption, radioactivation); optical methods (emission spectroscopy, absorption spectroscopy, refractive index); and mass methods (density). Evidently there are several alternatives to mass spectrometry which should be considered in practical problems.

Design of Electromagnetic Separators

This session, with Prof. Kistemaker in the chair, brought excellent papers from three leading workers in the field, the first being Dr. Normand, who gave a detailed and beautifully illustrated review of the Oak Ridge plant with technical details of the installation. The present equipment includes two small and two large calutrons which are operated for seven days a week on three shifts, and it is being planned to extend the facilities by adding two more large calutrons shortly.

Dr. Dawton then discussed the design considerations which led to the construction of the new high-resolution separator at Harwell. This machine, which is intended for enrichment of the isotopes of the transuranic elements and of fission products where high activities may be encountered, is a 4-ft. radius, 90° separator of the Nier type and is as fully automatic as possible. A detailed description was given of the remote-handling device for removal of the collectors containing the enriched product without exposure to air. Recent experimental results on the properties of plutonium of particular importance to its electromagnetic separation were also described.

Dr. Koch gave a masterly review of the Scandinavian separators in which, speaking for the groups in the three Swedish laboratories as well as for his own laboratory at Copenhagen, he described all four instruments. These separators have much in common, and a best basic design for use in nuclear studies has clearly been developed by these workers during the past fifteen years. The application to research on short-lived isotopes by integrating the separator with other tools such as the cyclotron and β-ray spectrometer to make a unified assembly which can attack most powerfully nuclear problems of all types was demonstrated. Dr. Koch concluded by making a plea for the preparation of the widest variety of stable and radioactive isotopes in the state of highest purity.

Two papers were presented to the conference at the last moment, and these fitted best with the session on design. The first was a theoretical paper by Dr. H. Bruck (Saclay), who showed that, for a magnetic separator of the usual sector type, the use of the alternating gradient principle in magnet design instead of the usual arrangement of a uniform magnetic field so far employed gives greater dispersion. In effect, one can have higher dispersion for the same radius, or the same dispersion for a smaller radius. The last paper was a possibly prophetic contribution beautifully presented by Dr. O. Osberghaus on the use of alternating-gradient electrical focusing for mass separation. In this system, using an arrangement very similar to that used on high-energy machines for beam ducting, a direct-current and radio-frequency voltage are applied to alternate plates. An experimental unit using this system has been successfully run at Bonn, and a larger one is now being constructed. This device is limited to small ion beams because of the lack of space-charge stabilization, but it seems that the principle may be useful for beams of up to 100 μamp. Dr. Osberghaus, who is working with Prof. W. Paul at Bonn, envisages two systems, one in which a selected mass is passed alone and the other in which a selected mass can be rejected.

Separation of Active Material

The last session, under the chairmanship of Dr. Bernas, consisted of two papers, though the earlier paper by Dr. Koch had, in fact, largely dealt with the same subject. Dr. G. Andersson reviewed nuclear studies in Scandinavia carried out with electromagnetically enriched radioisotopes. He described first the use of the separator for the preparation of samples of known masses for beta-ray spectroscopy and, in particular, for work on the rare-gas isotopes which are studied after trapping in foils. Extensive work on the radioactive nuclides of krypton and xenon has been done at Stockholm by this technique.

Dr. Bernas then dealt with his work at Saclay, where he has constructed a medium-sized separator particularly suitable for the elements of light and medium mass. This instrument can separate tens of milligrams of a given element in a day, while being sufficiently flexible to separate in rapid succession the radioactive isotopes of widely differing elements. Actual experience with this instrument has shown that both modes of operation are possible and successful; they provide alternative experimental approaches to the particular problems, and Dr. Bernas discussed their relative merits. He also described in some detail the work on technetium, which is prepared by cyclotron irradiation of a molybdenum target and then mass-separated. An interesting example of the application of the separator to alpha-particle spectroscopy was also described.

A lively discussion followed every paper, and it was felt that the conference had had some important results in directing attention to a great variety of applications of mass spectroscopy, and in describing many applications of electromagnetically enriched isotopes. Hitherto, the more spectacular application of radioisotopes and the relative ease of their techniques of use has overshadowed the uses of stable isotopes. It was felt that the present conference would show the rich field of work still waiting to be done in the latter field. In summing up, one might say that three main types of activity could be clearly recognized at the conference: the work of the two groups at Oak Ridge and Harwell in the provision of enriched isotopes for basic research of all kinds; the work of several European groups in the application of medium-sized isotope mass-separators to the direct study of a great range of nuclear problems; and lastly the large numbers of research workers who essentially are applying the enriched isotopes provided by Oak Ridge and Harwell to a great variety of researches. An important result of the conference was that the common interests of these groups were clearly recognized and great stimulus given to their work. It is hoped that on publication of the proceedings a much fuller appreciation of this new field will be generally gained. The proceedings, including lectures, discussion and illustrations, will be published shortly by Butterworths Scientific Publications, Ltd., London.

M. L. SMITH

MANAGEMENT AND HUMAN RELATIONS

AN attendance of nine hundred members at the annual conference of the Institute of Personnel Management at Harrogate during October 7–9 is an indication of the growing importance attached to the personnel function of management in British industry. Those attending came from very large and small manufacturing firms, departmental stores, nationalized industries, public corporations, insurance and other commercial concerns, educational institutions and the Armed Forces. A number came from overseas. At the plenary sessions speeches of a high order were given, and at the various sectional meetings the investigations now being made into the behaviour of people in industry by a number of research organizations were discussed.

Sir John Hunt, leader of the British Mount Everest Expedition in 1953, opened the conference with a challenging paper on the needs of youth in a Welfare State. There are, he said, many signs that the spirit of young people is either flagging or misdirected; there is too much apathy and hooliganism abroad. A great deal of fine work is still being done to help young people find their feet and set them on the road to good citizenship, and yet it would be foolish to be complacent and suppose that more could not and should not be done. Something is lacking in the opportunities offered, in the guidance given: What is this lack? First, the incentive to achievement is generally inadequate. If it is accepted that one of the needs in every individual is a sense of purpose, then the opportunity of achievement is an essential step in providing that purpose. Secondly, there is a great need for leaders, both in numbers and in quality. The paid-official alone will not do, and the need is for more volunteers, because they bring to young people a variety of experience of contemporary life. Ideally, leaders should have graduated from a similar background to members of the group —the best leadership is leadership from within the group, not from above it. The main source of youth leaders should be ex-members of the organizations themselves rather than older men implanted from outside and from a different environment.

A scheme should be devised which embodies incentives and sets certain targets or standards of achievement. How can such a scheme be made attractive and how can it work? Can a scheme of wide application be devised which might draw in more young people? Sir John suggested that it should be planned under four headings: the development of a hobby—a technical, scientific or artistic skill; the development of physical fitness—this calls for moral as well as physical stamina; outings, whether on foot or cycle or in a small boat—these are of tremendous value to the character training of young people and can be extended progressively until they assume the character of expeditions; and the instilling of the spirit of service—this is best caught by example, and the example must come from the leader.

Sir John was followed by Sir Richard Coppock, general secretary of the National Federation of Building Trade Operatives, who said that, in the main, the weakness of the building industry is on the managerial plane. He was particularly concerned about the missed opportunities for consultation between management and worker. The experience the workers possess is the basis of Britain's prosperity and is unequalled in any board-room in the country. Things do not go wrong on the drawing-board, he maintained, but when machines are being run and built, and he quoted the Comet aircraft as a good example of this. Half the difficulties in his industry arise because the employer does not enlist the goodwill of his men by telling them all the facts. The great problem facing management is how to handle men. One of the most vicious things they can do, when an unofficial strike takes place over some petty tyranny, is to say: "You must all go back at once. We cannot see you". This, said Sir Richard, puts the trade-union official in a most humiliating position—he is humiliated before negotiations have even begun.

Some management problems in the British Broadcasting Corporation were discussed by the director-general, Sir Ian Jacob. The Corporation employs

13,823 men and women, made up of 3,230 monthly paid staff, 3,950 secretarial and clerical staff and 3,643 manual staff. They belong to some fifty nationalities and more than a hundred professions which, with the wide geographical spread, create peculiar problems. The executive management is carried out by a board which consists of the director-general and six other directors. The directors of Sound Broadcasting, Television and External Services have purely functional duties, that is, they are responsible for a field of output and for the staff directly concerned with that output. The director of administration and the director of technical services have responsibilities which permeate the whole Corporation, though each has a considerable direct area of responsibility in addition. The sixth director is the chief staff officer to the director-general on policy matters.

The Corporation has no criterion of profit by which to test the success of the methods employed by its various parts, and it must therefore endeavour to regulate administration by giving to directorates the guidance emanating from specialist departments that are centrally established. One of these is the Central Establishment Office, which continuously investigates, in close co-operation with the heads of the departments concerned, staffing, organization and methods. Between two and three hundred technical assistants are recruited for the engineering staff each year, while for the programme and administrative staff a small number of young men and women are recruited straight from school or from university, though the majority enter at a later stage. The main need with regard to staff is for people who have attained a certain degree of experience and skill in the world and who enter the Corporation in response to public advertisement.

In such a diverse and dispersed body as the Corporation, a system is necessary which enables people to move easily from one compartment to another, for otherwise promotions would tend to remain within departments and a general rigidity would ensue. This problem is solved by a promotion system affecting the whole organization, a flexible grading system, and a scheme of bonuses for outstanding work and creative skill. Such a large organization gives rise to considerable problems of communication, but these are minimized by regular meetings up and down the chain of command and staff representation. Considerable staffing difficulties have been caused by the formation of the Independent Television Authority, and drastic measures have been used to deal with them. With the ending of the Corporation's solitary position in the country, broadcasting, and television in particular, are now moving into a new phase in Great Britain.

The development of research into the human factor in industry was outlined by Mr. A. B. Waring, chairman of Joseph Lucas (Industries), Ltd. This had, in 1953, led to the setting up of the Joint Committee on Human Relations in Industry, with himself as chairman, to advise the Department of Scientific and Industrial Research and the Medical Research Council on research in this field. The majority of the projects it has accepted fall under four broad headings: incentive schemes with reference to the social factors associated with them; technological change with reference to the human implications involved; management organization with reference to staff supervision and functional specialists; promotion and training. There are also special projects such as relations between office staffs and factory workers and the effects of ageing on adaptability to work.

It is possible, he said, to approach the subject of human relations in industry from a basic theory that any community left to its own devices will establish for itself in the course of time a *modus vivendi* which will satisfy the majority of its members so that the pattern of relationships among them and their general contentment will remain more-or-less constant. But when violent changes are imposed by wars, the impact of other civilizations or the upheavals due to the changes that industrialization brings about, the pattern of society becomes distorted and discord ensues. Changes in the pattern of work and employment brought about by changes in the circumstances of trade and by ever-increasing mechanization can result in disturbances ranging from suppressed resentment to open resistance. Man, being a reasoning animal, is prepared to accept change when it is properly presented and when he is satisfied that he will benefit or that his future depends on it.

The best human relations will exist in those factories in which leadership qualities are high and well founded and are regarded as being no less important than technical and administrative ability, and where both leaders and led work in circumstances that maintain continuously both their status and their morale. Mr. Waring suggested that before any project of research into human relations in industry is undertaken, it should first pass the test of whether or not it falls into the category of a deeply rooted problem of general significance; if not, and if it can be classified as a problem resulting from inadequate local management, it is unlikely to be a subject for basic research and may well be dealt with through management training and reorganization or through investigation by industrial consultants. But where, in a branch of industry, there is a general malaise evidenced by labour unrest with no apparent sensible justification, or where in specific instances the support of workpeople is withheld or there is either open or suppressed resistance the reasons for which are obscure, research is the obvious and perhaps most valuable method of approach.

Mr. Waring stressed the importance of choosing subjects for research in human relations most carefully; otherwise there is the danger of regarding such research as a type of industrial patent medicine. It is equally important that its practitioners should be worthy of their tasks. T. H. Hawkins

OBITUARIES

Sir Malcolm Watson

Sir Malcolm Watson, director during 1933–42 of the Ross Institute of Tropical Hygiene (London School of Hygiene and Tropical Medicine), died on December 28 at the age of eighty-two.

The successive steps which led to modern conceptions of the epidemiology of malaria were: (1) Manson's hypothesis that mosquitoes transmit the disease; (2) Ross's confirmation that mosquitoes do transmit, and his own, most important, contribution showing that not all of them do so—not the grey mosquito, not the brindled mosquito, only the dapple-winged one; (3) Grassi's entomological addition that the mosquitoes which transmit malaria all belong to the genus *Anopheles*; and, finally, (4) Stephens and Christophers', and James's, fundamental rules: (*a*) some species only of the genus *Anopheles* are of practical importance in malaria transmission, and (*b*) each of them has its own preferential breeding places.

Malaria control, as an activity directed against mosquitoes, had taken no account of these rules, which I have called fundamental because they became, in Watson's hands, the basis of antilarval measures. Anti-mosquito work, in the early days, consisted of measures directed against the breeding places of mosquitoes, irrespective of their genus or species. As often as not more larvæ were killed belonging to the genera *Culex* or *Aedes* than to *Anopheles*. The waste of effort was compensated, to some extent, by the fact that the earlier successful campaigns were directed against urban malaria (Ismailia, Havana, Port Swettenham), with the advantage of the population to be protected living within a comparatively small area.

That was Watson's experience in Malaya. He had successfully dealt with the malaria epidemic in Port Swettenham, the newly opened maritime port of the rubber-growing districts, which threatened to become useless because of malaria. Watson saved it from being closed again; but he was at a loss how to act when he was requested to apply his method to the rural areas where rubber was grown, and where the labourers employed on the estates were seriously affected by endemic malaria. It was clearly impossible to remove, or to oil, all breeding places of mosquitoes in a large rural area, as had been done in a small urban area: the expense would have been prohibitive.

At this juncture Watson remembered the Stephens–Christophers–James rules, and the way they had been established. He applied his predecessors' method of research, which has become the pattern of the so-called malaria survey: the preliminary stage of every anti-malaria campaign. This survey includes two main sections. The first consists of three parts: (1) determining the distribution of malaria in the district; (2) collecting adult anopheles and identifying them, so as to be able to compile a list of the anopheline species of the district, and to establish the distribution of each one of these species; (3) comparing the data afforded by (1) and (2), in order to find out whether or not a correlation can be established between the distribution of malaria and of one of the local anopheline species. If such a correlation exists, the species involved is suspect of being the local vector of malaria. The second section of the survey consists of two parts: (1) determining the natural rate of infection with malaria parasites of each one of the local anopheles, in order to check the results obtained in the first section; (2) identifying the principal breeding places of each anopheline species. When the principal local vector has been identified in this way, and it has been proved, moreover, that this species has more or less specialized breeding habits, which induce it to select a certain type of breeding place in preference to all others, it becomes possible successfully to suppress the breeding of that one species, by dealing with its preferential breeding places, while leaving undisturbed all other collections of water, and the larvæ of the species breeding therein. This method of selective larval control, which since then has been called 'species sanitation', was first elaborated by Watson on the rubber estates in the flat swampy land of the coastal area of western Malaya, where *Anopheles umbrosus* was proved to be the main vector, and next in the hilly country, where *Anopheles maculatus* takes over this function. It proved much less expensive than the indiscriminate larval control applied in cities, and so it rendered possible "rural sanitation in the tropics", the highly appropriate title selected by Watson for his first book.

Watson's method of species sanitation has conferred untold benefits on many countries to which it was applied, notably on the former Dutch East Indies (now Indonesia). So it is not inappropriate that the editors of *Nature* should have invited a Dutchman to pay posthumous homage to this benefactor of humanity.

N. H. SWELLENGREBEL

Dr. V. E. Nash-Williams

DR. V. E. NASH-WILLIAMS died suddenly at the age of fifty-eight on December 15. He had been keeper of archæology in the National Museum of Wales and lecturer in archæology (more recently head of the Department of Archæology) in the University College, Cardiff, since 1926. For those long years he had held two posts. The second, the teaching of archæology in the College, had, in recent years, expanded from a subsidiary to an honours course as a result of his work.

Dr. Nash-Williams's earliest excavations were a series made in the 'twenties and 'thirties on the Roman legionary fortress of Caerleon. Those which proved to be his last were on the civil settlement which he had long supposed to lie outside the fortress walls in an area still, by good fortune, not built over; the other legionary fortresses of Britain provide no similar opportunity. His suppositions were proved to be correct by his excavations of 1954 and 1955, excavations which he had hoped to continue for many years, for the area is a large one and the promises were good.

He had also conducted important excavations at the Roman town of Caerwent and on the Early Iron Age hill-forts at Llanmelin and Sudbrook in Monmouthshire, and on the monastic site and the Roman villa at Llantwit Major and the Roman auxiliary fort at Neath, in Glamorgan. The results of these and other works are to be found in publications of the National Museum of Wales, or in *Archaeologia, Archaeologia Cambrensis* and the *Bulletin of Celtic Studies*.

A field survey of the Roman military sites in Wales led in 1954 to his book "The Roman Frontier in Wales", an up-to-date review of the evidence of the Roman occupation, and a work now indispensable to any serious student of Roman Britain. A comprehensive inventory and survey of the more than four hundred early Christian crosses and monuments of Wales form the subject of his largest work, "The Early Christian Monuments of Wales", published in 1950. It is richly illustrated and does for Wales what Romilly Allen and Anderson's book did for Scotland. This work alone is a memorial of his industry and scholarship.

Dr. Nash-Williams believed that if archæology was to be a live subject, there must be active excavations on one hand, and on the other a continuous exposition of the results to the public. In this, as in other ways, his practice matched his principles. His untiring work in the field and in writing, teaching and lecturing caused his subject and his interests to be widely known, and they, and his personal qualities, made him greatly esteemed. He possessed humility and a charm of manner and was a devout churchman. In each of the World Wars he served in the Army, in the first in the infantry and in the second in the R.A.S.C., from which he was seconded to the Historical Section (Military) War Cabinet Offices, for preparatory work on the official history of the War.

The archæological world has lost a mature and industrious scholar and we in the National Museum of Wales mourn the loss of a distinguished colleague and a friend. The deepest sympathy is extended to his widow, his sons and his mother.

D. Dilwyn John

Mr. P. Y. Millns

Peter Yorke Millns, a brilliant research student of astronomy in the University of Manchester, lost his life on the Aletsch Glacier near the summit of the Jungfrau in the Swiss Alps on December 19.

Peter Millns, who was twenty-two years of age, graduated in physics in the University of Manchester with first-class honours in June 1954. He then joined the Department of Astronomy of the University to do research in nebular photography with high-speed Schmidt cameras in monochromatic light. With the help of Dr. A. Burawoy, of the College of Technology, Manchester, Millns developed in a short time an important application of dye filters for astronomical photography, and his first contribution to this subject was presented at the Manchester symposium on astronomical optics held last April. Quest for transparent skies led him repeatedly to Europe's highest observatory at Sphinx, Jungfraujoch (3,576 m.), and there he met his untimely end in a mountaineering accident during leisure-time. The accident has deprived science and the University of Manchester of a brilliant young scientist and a well-liked colleague.

NEWS and VIEWS

Archæology of the Roman Empire at Oxford: Prof. I. A. Richmond, F.B.A.

Next October there will come into existence in the University of Oxford a chair in the archæology of the Roman Empire, and Prof. I. A. Richmond, himself an Oxford graduate, has accepted an invitation to be its first occupant. Prof. Richmond, who is fifty-three, is at present professor of Roman–British history and archæology at King's College, Newcastle upon Tyne, where he has been for the past twenty years. He is a leading authority on Roman Britain, and has excavated in many widely separated places in England and Scotland. Most recently he has been engaged with Dr. J. K. St. Joseph at Inchtuthil in work not yet finished which will give a complete picture of an unaltered Flavian legionary fortress, the general headquarters of the governor Agricola. Prof. Richmond early in his career, in 1930, produced the standard work on the City Wall of Imperial Rome. His most recent book is the masterly history of Roman Britain published last year by Penguin Books, Ltd., which ends with an admirable twelve-page bibliography. Prof. Richmond is a Fellow of the British Academy and an honorary graduate of the University of Edinburgh; in May he is to receive an honorary degree from the University of Leeds. In the University of Durham he has served with distinction as dean of the Faculty of Arts and as Public Orator. He is widely known as a skilful lecturer of exceptional clarity of speech. Joined to his patient devotion to study and investigation are a warmth of human sympathy and gaiety of heart which will endear him, as it has endeared him to his many friends at Newcastle and elsewhere, to the society of All Souls College, Oxford, of which he will be a Fellow when he takes up his new professorship next autumn.

Nicholas Kulchitsky (1856–1925)

The eminent histologist, Nicholas Kulchitsky, was born at Kronstadt a hundred years ago, on January 30, and it is almost exactly thirty-one years since he met with the accident in London that led to his death at the age of sixty-nine. Kulchitsky was appointed to the chair of histology at Kharkov in 1893, retiring from it in 1910 in order that the younger members of his staff might have better opportunities for promotion. He held a number of appointments in Russia before the revolution of 1917, finally becoming Minister of Education. There followed a period of considerable hardship until he arrived in England in 1921. He joined the staff of the Anatomy Department at University College, London, on the invitation of Sir Grafton Elliot Smith, continuing to teach and to follow his research work until his death in 1925. Kulchitsky's scientific work extended over a wide field of histological investigation, ranging from studies on the intestinal epithelium to the comparative anatomy of nerve-endings in muscle. He will always be remembered for his discovery of the cells of the intestine that at one time carried his name. Nowadays these cells are known as argentaffin or enterochromaffin cells, and their function is still not clear. They have been thought to be neurosecretory or concerned with the absorption of vitamin B_{12}; but many workers consider that Kulchitsky's own suggestion that they produce secretin may well be correct. He was an admirable technician, and his name is continually recalled to neurologists by his modification of the Weigert method that made possible the better staining of myelinated nerve fibres.

Benjamin Franklin in Britain

Benjamin Franklin made his first visit to London in 1724, when still an unknown lad. His second visit, lasting from 1757 until 1762, was made as a delegate of the General Assembly of Philadelphia, and during these five years he was in close touch with the Royal Society, of which he had been elected Fellow in 1756, and the newly founded Society of Arts (see also *Nature* of January 14, p. 60). When Prof. E. N. da C. Andrade delivered the Trueman Wood Memorial Lecture to the latter Society on January 18, he took as his subject "Benjamin Franklin in London". After giving a brief account of Franklin's early life, and his electrical experiments, Prof. Andrade turned to his visits to England, and described his close association with scientific circles in London during his second and third visits to England. The latter extended from 1764 until 1775. Over nearly two decades, Franklin was closely associated with the administration of both the Society of Arts and the Royal Society, attending many committee meetings of the former and serving four times on the Council of the latter. A Franklin Commemorative Medal was presented to the Royal Society of Arts during the meeting.

Franklin was a member of many other scientific societies, including the Royal Society of Edinburgh. At a meeting held in the rooms of this Society on January 16, lectures were given by Prof. A. D. Ritchie, professor of philosophy in the University of Edinburgh, and Dr. W. P. D. Wightman, reader in the history and philosophy of science in the University of Aberdeen, on "Franklin's Political Career and Philosophical Outlook" and "Franklin as a Natural Philosopher", respectively. Both lecturers commented on Franklin's wide interests and great gifts. When he visited Edinburgh in 1759, he was made a burgess by the Town Council, and became a member of the Philosophical Society, the forerunner of the Royal Society of Edinburgh itself. The latter Society elected him as one of its first honorary fellows. The meeting opened with the presentation by Mr. E. D. Kuppinger, American Consul-General in Edinburgh, of a Franklin Commemorative Medal to the Society.

Geological Society of London: Awards for 1956

The Geological Society of London has made the following awards for 1956: *Wollaston Medal*, to Prof. Arthur Holmes, professor of geology in the University of Edinburgh, for his world-wide interests in petrology and petrogenesis and the application of radioactivity to the problem of geological time; *Murchison Medal*, to Dr. F. M. Trotter, assistant director of H.M. Geological Survey, for his studies of the structure and stratigraphy of the Carboniferous rocks of England and Wales, especially in relation to coal and iron; *Lyell Medal*, to Dr. L. R. Cox, of the British Museum (Natural History), for his palæontological researches, especially on the Mesozoic and Tertiary molluscs; *Wollaston Fund*, to W. B. Harland, of the University of Cambridge, for his researches on the structure and stratigraphy of Spitsbergen; *Murchison Fund*, to Dr. W. W. Black, of the University of Cambridge, for his research work on the sedimentation and contemporaneous structures of the Carboniferous Limestone; *Lyell Fund*, a moiety to Dr. W. S. Pitcher, of King's College, London, for his researches on the igneous and metamorphic rocks of Donegal and on the Tertiary and Pleistocene deposits of south-east England, and another moiety to H. R. Tainsh, chief geologist of the Burmah Oil Company, for his researches on the geology and oil resources of Burma.

Two New Research Reactors at Harwell

The United Kingdom Atomic Energy Authority has announced that two new reactors (or atomic piles) are now operating at Harwell—ZEUS (zero-energy uranium system) and ZETR (zero-energy thermal reactor)—both of which are for research purposes only and run at very low power-levels. ZEUS has a cylindrical core, roughly 20 in. in diameter and 20 in. long, which is made of uranium very highly enriched in the rare isotope uranium-235; the enriching was carried out at the Atomic Energy Authority's factory at Capenhurst, near Chester. The core is surrounded by many tons of uranium in which plutonium is formed gradually as the pile runs. The very low power-level of 100 W. at which the reactor is operated is such that no cooling is required, although the rate of the nuclear reaction is adequate for making experimental measurements. It has been built to check the nuclear calculations on which depends the design of the fast reactor of about 60 MW. which is being built at Dounreay in the north of Scotland, and in many essentials it is a full-scale version of the Dounreay reactor. The other research reactor, ZETR, uses a nuclear fuel in solution and is intended to provide information about the quantities of fuel which will be required for large-scale reactors using such solutions. Plutonium has already been studied in this reactor; uranium-235 is being studied now and uranium-233 is to be studied later this year. Natural water is used as a solvent at present; but in the summer heavy water is to be used.

The Derbyshire Earth Tremor of January 10

An earth tremor, accompanied by a low rumbling sound, occurred in Derbyshire on January 10 and was felt in many places in Derbyshire, Leicestershire, Rutland and Nottinghamshire. Up to a distance of some ten miles from the epicentre, windows and crockery rattled, and cases occurred of beds moving and pictures falling from walls. At Woodhouse Eaves in Leicestershire, the tremor appeared to come from the north. The shock was reported from Derby, Leicester, Nottingham, Burton-on-Trent, Ashton-on-Trent, Melton Mowbray, Rothley, Coalville, Heanor and Castle Donington. It was recorded on the Milne–Shaw horizontal seismograph at Bidston Observatory, near Liverpool, at 08h. 12m. 14s. G.M.T., and on the short-period vertical seismograph (made at Kew) at Kew at 08h. 12m. 21s. G.M.T. The shock was also recorded at Durham University Observatory and at Rathfarnham Castle, Dublin. It was just recorded at the Royal Observatory at Edinburgh, but not at Aberdeen. From the readings it appears that the epicentre was to the south-east of Derby (near 52° 50′ N., 1° 25′ W.), and the initial time was 08h. 11m. 51s. G.M.T.; the depth of focus was probably about 12 or 13 km. There may have been an aftershock from the same district a little after 10 a.m.; but the recording of this is doubtful owing to microseisms, and also waves arriving from an earthquake in the Pacific.

The earliest earthquake noted from Derbyshire occurred in the year 1084, and there were further earthquakes in November 1678; October 31, 1734; July 10, 1738; and June 26, 1748; but the largest shock was on November 18, 1795, about 11.10 p.m. On that occasion, chimneys were thrown down at Derby, Nottingham and Ashover, and the shock was felt as far away as York, Liverpool, Bristol, London and Norwich. A shock with its epicentre four miles south-east of Derby was felt on November 13, 1872, about 4.10 p.m. Earth tremors occurred at Winster in Derbyshire in 1952. That of February 22 at 9.20 a.m. had intensity VI on the Modified Mercalli Scale. More feeble shocks occurred on February 24, March 17 and two on April 15. The tremors in 1952 were probably due to geological fault adjustments along the branch faults which are a continuation of the Crich–Cromford–Bonsall fault belt. A further slight tremor occurred at Winster on November 15, 1954. The shock rattled doors, windows and crockery, and a crump-like sound preceded the tremor.

Royal Society and Nuffield Foundation Commonwealth Awards

Awards under the Royal Society and Nuffield Foundation Commonwealth bursaries scheme have been made as follows : Dr. A. Bose, reader in physics, Indian Association for the Cultivation of Science, Calcutta, to study the techniques of paramagnetic resonance at the Clarendon Laboratory, Oxford (January 1956–January 1957) ; Dr. H. B. S. Cooke, senior lecturer in geology, University of the Witwatersrand, to study African fossil mammal collections in the British Museum and the Powell–Cotton Museum with the view of taxonomic determination of ungulate cranial and skeletal material in Africa, and also to study modern methods of age-determination applied to Quaternary deposits and related fossil material (January–June) ; R. G. Cooke, senior lecturer in organic chemistry, University of Melbourne, to study modern techniques in the isolation of natural products and in the determination of molecular structure at the University of Cambridge (February–August) ; G. C. Israel, senior lecturer in physical chemistry, University of Hong Kong, to enable him to study modern methods of research in chemical kinetics and mechanisms at University College, London (September 1956–March 1957) ; Prof. L. C. King, professor of geology, University of Natal, to carry out field studies in Australia on the sequence of cyclic denudational landscapes, on pediplanation and on the relation of soils to landscape evolution (January–March) ; A. D. McKay, Matopos Research Station, Southern Rhodesia, to study problems and techniques in pasture research and ecology in semi-arid areas of Australia with particular reference to management and use of natural grasslands (for about four months from September) ; Dr. K. G. McNeill, lecturer in natural philosophy, University of Glasgow, to work with the research group on the 23-MeV. betatron at Saskatoon (June–August) ; G. B. Masefield, University demonstrator in tropical agriculture, Department of Agriculture, Oxford, to observe the characteristics of nodules on the roots of annual leguminous crops at four widely dispersed centres in the typical wet-tropical environment of Malaya (June–September) ; S. Smith-White, senior lecturer in botany, University of Sydney, to discuss at Oxford, the John Innes Horticultural Institution and elsewhere his researches into cytological conditions in the Australian flora and other matters (for about twelve months from January) ; Dr. A. M. Stephen, lecturer in organic chemistry, University of Cape Town, to work at Edinburgh, in a study of carbohydrates, with emphasis on polysaccharide structure determination, and also of biochemical aspects of carbohydrate metabolism (January 1956–January 1957) ; M. W. Tracey, Rothamsted Experimental Station, to study the methods in use and being developed at Melbourne for the study of cellulase and the microbial degradation of keratin (January–December).

Manchester Literary and Philosophical Society

THE Council of the Manchester Literary and Philosophical Society proposes to publish a history of the Society from its foundation in 1781. Unfortunately, the Society's home was destroyed by enemy action in December 1940, and there perished with it not only the Society's Library but also all its Minute Books and other records. The Council wishes, therefore, to enlist the help of any former members or other persons who possess or know of any material which throws light, however dim, upon the history and development of the Society at any period. It would be grateful for any bibliographical references to allusions to the Society, however obvious they may seem to be. Any original material forwarded would be copied and returned with the minimum of delay. It is proposed to issue the history at the time of opening the Society's new building, the construction of which will shortly begin. Communications should be sent to Dr. W. H. Brindley (honorary librarian) or F. Willett (honorary editorial secretary) at the Society's present address, Portico Library, 57 Mosley Street, Manchester 2.

Agricola's Position in Science

PRESIDENT HERBERT C. HOOVER had an extraordinary career as a mining engineer in Asia, Europe, Africa and America before he became the thirty-first president of the United States in 1929. In 1912 he and the late Mrs. Hoover published their translation from the Latin of Agricola's classic work, "De Re Metallica". The introduction to their work has been reprinted in a recent issue of the *Scientific Monthly* (81, No. 5 ; November 1955). Mr. and Mrs. Hoover suggest that, in his departure from the peripatetic school of the Greeks by making use of observed facts, Georgius Agricola must rank as one of the truly great pioneers of science.

Electric Fencing against Game

EXPERIMENTS in Africa to keep wild animals inside reserves or away from areas required by man are described in *Oryx* (3, No. 3 ; November 1955). In the first experiment one strand of steel wire was mounted at a height of 15 in. around the outside of a plot roughly a hundred acres in area. The power unit for the fence was an ordinary electric fencer of the type used by farmers for fencing cattle and was run from a six-volt car battery. This was effective against bush-pig and bush-buck and against baboons when erected in the manner described above. It was not effective against monkeys. In a second experiment a strand of steel wire was erected 40 in. high and was intended to be a barrier to the movement of large animals along the west side of Lake Manyara. Unfortunately, the results of the experiment were masked by conditions which could not be controlled but were still encouraging enough to indicate that electric fencing is a possible method of restricting the movement of game.

Geological and Geomorphological Research in the South-West of England

A CONFERENCE of geologists and geomorphologists was held in the University of Exeter during January 5–7, with the object of encouraging the development of research in the South-West of England by promoting contact between those engaged in it. There are about seventy geologists and geomorphologists directly or indirectly doing research on problems of the area, and, of these, fifty-two were present, including fourteen postgraduate students at universities ; nine of those attending were geomorphologists and geographers rather than geologists. The formal sessions were not intended for the announcement of work done but for the discussion of matters of general interest. The chief topics discussed were : the palæontology of the Devonian, the stratigraphy of the Culm, the pegmatites, the folding and faulting, the Lizard and Start boundaries, and high-level surfaces on Exmoor and Dartmoor. It was agreed by all that the conference had been highly successful, and it is hoped to arrange a further conference next year.

Bradford Symposium and Exhibition on Radiochemistry
